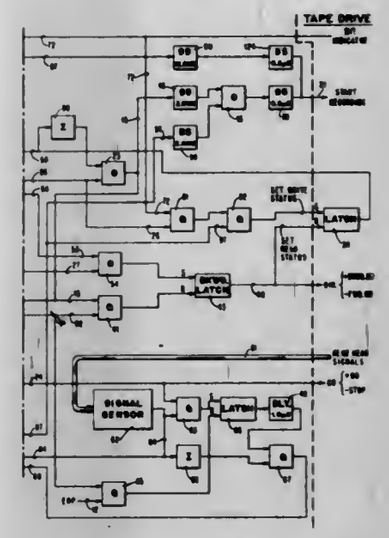
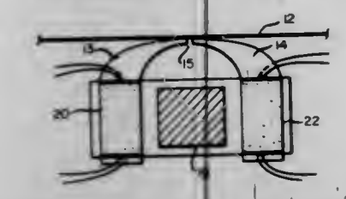
1. In a system for storing data in a shift register having a first and last stage wherein there is a first magnetic core having at least two input minor apertures, and a last magnetic core having at least one output minor aperture, a system for gating information into said register comprising a first, second and third magnetic core, winding means coupling said third magnetic core with said last and first shift register cores for enabling an input to said first shift register core only in the absence of an output from said third core, means coupling said first and second and first and third cores for transferring an output from said first core to said respective second and third cores, transfer winding means for applying output from said second core to said first core of said shift register, means for conditioning said second core after receiving an input from said first core in accordance with data desired to be entered into the first core of said shift register, and means for simultaneously applying a drive to said second core, said third core and the last core of said shift register, for entering data in accordance with the condition of said second core into the first core of said shift register, for preventing the entry of data from said last core of said shift register, into said first core of said shift register, and for applying an output from said third core to said first core.



3,274,573
MAGNETIC TRANSDUCER
Henry M. Merrill, Altadena, and Gardner P. Wilson, Arcadia, Calif., assignors to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Aug. 21, 1961, Ser. No. 132,677
8 Claims. (Cl. 340—174.1)

1. A magnetic transducer for reading and writing simultaneously on a single track of a magnetic carrier comprising a substantially non-magnetic body having a pair of spaced, closed loop magnetic portions each including an exposed high reluctance transducing gap therein arranged in the same plane for reading and writing simultaneously, a magnetic shield arranged between said transducing gaps carried by said body to shield the transducing gaps from one another, said magnetic portions being arranged in a divergent relationship relative to said intergap magnetic shield for minimizing cross-coupling, and at least a single transducing winding individually coupled to each of said magnetic portions for defining the read and write transducers.

3,274,574
BACKHITCHING TAPE CONTROL
Earl W. Miller, Poughkeepsie, and John W. Irwin, Wappingers Falls, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 24, 1962, Ser. No. 246,813
12 Claims. (Cl. 340—174.1)

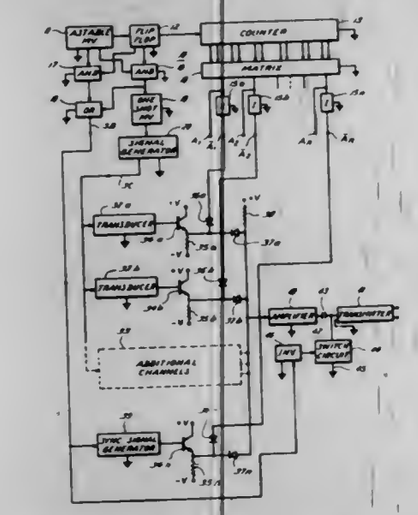


1. A system for backhitching a digital tape data block recorded on a tape in a tape drive comprising:
means for sensing the occurrence of a write command while said tape drive is in read status to provide a backhitch signal,
means for driving said tape in a backward direction in response to said backhitch signal,
and means for reversing the direction of movement of said tape in response to sensing an end of a prior block.

3,274,575
TRANSDUCER HAVING A MAGNETO-RESISTIVE BRIDGE CIRCUIT

Heinz Adolf de Koster, 55 Madrona St., San Carlos, Calif.

Filed Aug. 1, 1963, Ser. No. 299,333
17 Claims. (Cl. 340—174.1)



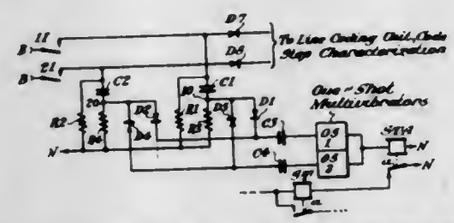
17. A transducer comprising a magnetic bridge having four arms, each of said arms providing a path for magnetic flux and each including a high reluctance gap, adjacent arms being magnetically connected to form bridge terminals, and four magneto-resistive elements one disposed in each of said arms in said gap. each of said elements including two terminals for connecting the same to associated electrical circuits.

3,274,576
TELEMETERING ENCODER SYSTEM

Jean Hubert Guignard, L'Hay les Roses, France, assignor to Societe de Prospection Electrique Schlumberger, S.A., Paris, France, a corporation of France

Filed June 4, 1962, Ser. No. 199,729
Claims priority, application France, July 12, 1961, 868,564
15 Claims. (Cl. 340—183)

1. A telemetering encoder system comprising: a plurality of transducer means; a common output signal channel; diode switching circuit means including coupling diodes for individually coupling the different transducer means to the common output signal channel and circuit means for activating the coupling diodes one at a time in sequence; and clamping circuit means coupled to the common output signal channel for periodically clamping the signal level in the output channel at a predetermined constant value.



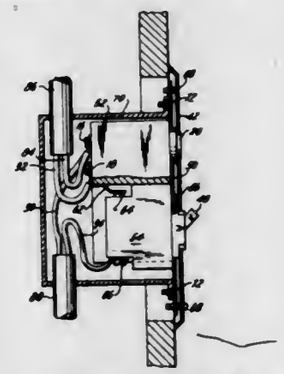
3,274,577
STATUS CHANGE DETECTION APPARATUS

Donald E. Stark, Eastwood, Pa., assignor to Westinghouse Air Brake Company, Swissvale, Pa., a corporation of Pennsylvania

Filed Oct. 18, 1963, Ser. No. 317,309
2 Claims. (Cl. 340—213)

1. Indication code starting apparatus for the remote stations of a coded remote control system, comprising at each station in combination,

(a) a condition repeating SPST contact for each two-condition indication function, operable between a closed and an open position to repeat the first and second conditions respectively of the corresponding function,
(b) a capacitor associated with each repeating contact,
(c) an auxiliary starting relay,
(d) a source of direct current energy,
(e) a first and a second one shot multivibrator device,
(f) a first circuit for each capacitor including said source, the corresponding repeating contact, the capacitor, and a first resistor for charging that capacitor when said corresponding repeating contact closes,
(g) a second circuit for each capacitor including that capacitor, the corresponding first resistor, and a second resistor connected in series for discharging that capacitor when the corresponding repeating contact opens,

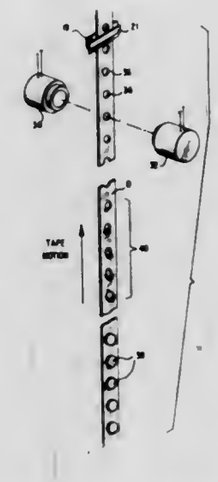


(h) a coupling network connected between said first multivibrator device and each capacitor for applying an actuating pulse of preselected polarity to said first device when a repeating contact closes,
(i) another coupling network connected between said second multivibrator device and each capacitor for applying an actuating pulse of opposite polarity to said second device when a repeating contact opens,
(j) an energizing network for said auxiliary relay jointly controlled by said multivibrator devices for briefly energizing said relay when a multivibrator device is actuated,
(k) a starting circuit means controlled by said auxiliary relay for initiating an indication code when said relay is energized.

3,274,578
FIRE ALARM SYSTEM

Charles Block, 1129 Albert Road, North Bellmore, N.Y., and Leon J. Mintz, 1046 E. 29th St., Brooklyn, N.Y.

Filed Feb. 5, 1964, Ser. No. 342,704
5 Claims. (Cl. 340—220)



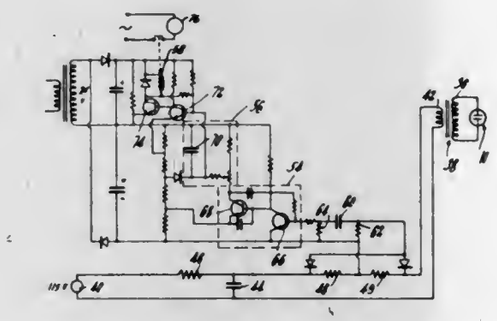
1. A transmitter assembly for a fire alarm system which transmitter is intended to transmit by high frequency carrier to a receiver-controlled alarm through the usual household power supply wiring, said transmitter being compactly dimensioned and being housed together with a power wiring component in the standard recessed wall receptacle previously used for said wiring component, said transmitter including a temperature responsive sensor, and having high frequency oscillator

circuitry controlled by said sensor, and a cover plate for said wall receptacle, said cover plate having an opening for the sensor and having another opening for the said wiring component, said transmitter and wiring component having appropriate terminal screws at the back for line and ground connections inside the recessed wall receptacle.

3,274,579
FUSIBLE PLUG FLAME DETECTION SYSTEM

Forney Fuller, Jr., P.O. Box 12151, New Orleans, La.

Filed Feb. 25, 1964, Ser. No. 347,157
6 Claims. (Cl. 340—227)

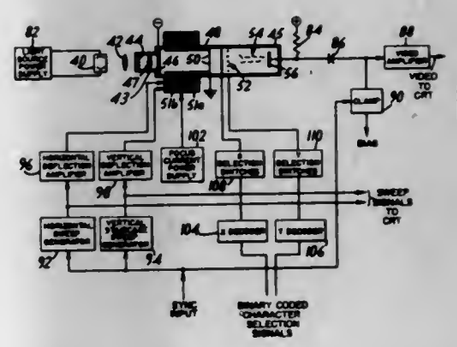


6. The method of detecting flame failure in a static installation having a fuel burner therein including the steps of continuously inserting and withdrawing from a combustion area within said static installation a probe having a plurality of spaced fusible elements thereon, detecting the melting or non-melting of fusible elements and continuously providing said probe with new fusible elements.

3,274,580
RADIATION DETECTION DEVICE CIRCUITS FOR USE IN FLAME SENSING

Elihu C. Thomson, Wellesley, Mass., assignor to Electronics Corporation of America, Cambridge, Mass., a corporation of Massachusetts

Filed Aug. 10, 1962, Ser. No. 216,121
8 Claims. (Cl. 340—228)



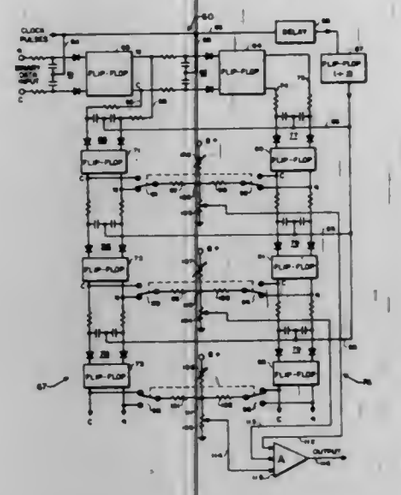
6. In combination, a radiation detection device having an envelope transparent to the radiation of interest,
a pair of spaced electrodes mounted within said envelope,
a voltage step up transformer having primary and secondary windings inductively coupled together,
said secondary winding being connected in series with said electrodes,
means to supply magnetizing current to said primary winding through a current controlling resistance to produce a high voltage electric field between said electrodes,
a circuit including a capacitor connected to said primary winding for augmenting said magnetizing current supply means when said radiation sensing device breaks down in discharge action upon the sensing of radiation of interest,
a readout impedance connected in circuit with said primary winding,
and means coupled to said readout impedance for providing a signal indicative of the sensing of radiation of interest.

3,274,581
IMAGE SCANNING APPARATUS

James Kenneth Moore and Peter C. Goldmark, Stamford, Bernard R. Linden, South Norwalk, and Marshall P. Wilder, Stamford, Conn., assignors to Columbia Broadcasting System, Inc., New York, N.Y., a corporation of New York

Filed Mar. 28, 1963, Ser. No. 268,718
16 Claims. (Cl. 340—324)

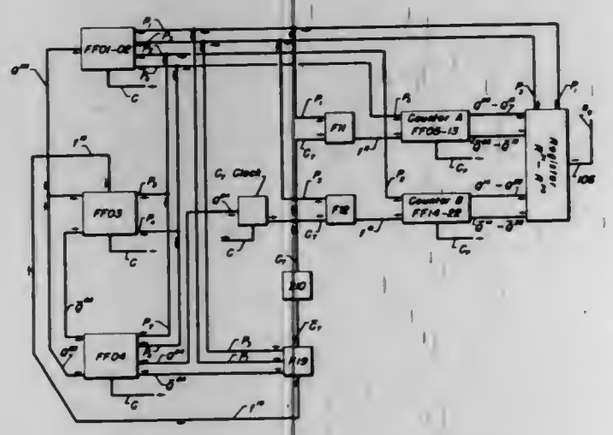
2. Apparatus for producing electrical signals representative of figures to be generated by an output device comprising, means for simultaneously producing electron images of a plurality of figures to be generated, an electrode having a like plurality of apertures therein, the size of said apertures being small relative to their respective electron images, means for accelerating the electrons forming said images toward said electrode, means for deflecting all of said electron images in accordance with the same predetermined scanning pattern as the electrons accelerate toward said electrode whereby streams of electrons corresponding to the electron images flow through the respective apertures, means for deriving an output signal from a selected one of said streams of electrons, and means coupling said output signal to said output device.



3,274,582
INTERDIGIT INTERFERENCE CORRECTION

Earl D. Gibson, Hyattsville, Md., assignor to ACF Industries Incorporated, New York, N.Y., a corporation of New Jersey

Filed Aug. 25, 1961, Ser. No. 133,936
7 Claims. (Cl. 340—347)



1. Apparatus for converting digital data from a first code to a second code having a higher radix and compensating for interdigital interference, comprising first means for supplying serial digits of the first code, first and second shift registers, second means for feeding odd digits from said first means to the first shift register and even digits from said first means to the second shift register, third means connected to said shift registers for causing them to shift after every second digit, fourth means for obtaining an output pulse from each stage of said shift

registers, fifth means for adjusting the amplitudes of the output pulses of said first register relative to the output pulses of the second register according to said second code and for adjusting the amplitudes of the output pulses

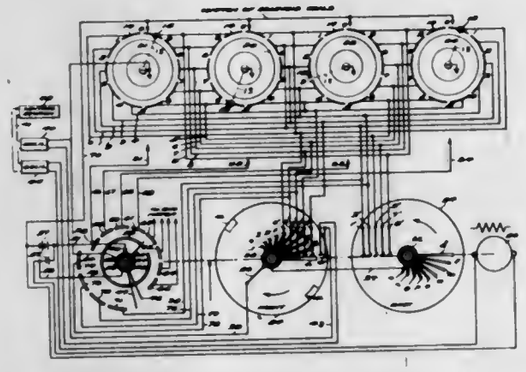
of successive stages of the shift registers relative to one another to values which compensate said interference, and means for superimposing all said adjusted output pulses.

3,274,583
PULSE RATE CONTROLLER
David M. Boyd, Jr., Clarendon Hills, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
Filed Nov. 6, 1961, Ser. No. 150,436
7 Claims. (Cl. 340—347)

1. Apparatus for controlling the pulse rate of a variable frequency pulse source, said frequency being responsive to an analog control signal, which comprises in combination:

(a) programming means alternately and repetitively producing first and second command pulses which are noncoexistent;

(b) variable time gating means generating a counter enabling pulse of adjustable time duration in response to said first command pulse;



(c) a counter adapted to receive and count said variable frequency pulses in response to and only for the duration of said counter enabling pulse;

(d) register means producing an analog register signal proportional to the total count stored therein;

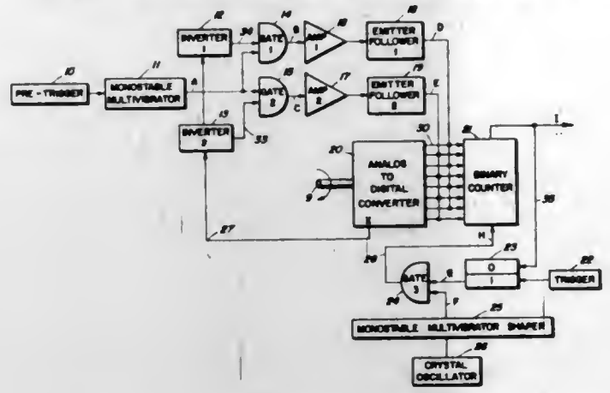
(e) register input means for transferring from said counter to the register means, in response to said second command pulse, the total count reached by said counter during the existence of said counter enabling pulse; and

(f) an integrating amplifier receiving said register signal and producing as its output signal said analog control signal.

3,274,584
APPARATUS FOR REMOTE READING OF UTILITY METERS
Donald P. Morgan, Box 145, R.D. 1A, Russell, Pa., and Donald D. Dalrymple, 6 Woods Road, North Warren, Pa.
Filed Aug. 29, 1963, Ser. No. 305,380
14 Claims. (Cl. 340—347)

1. Apparatus for telemetering to a remote location the relative positions of a plurality of rotary shafts of a meter register of the decimal integrating type, comprising a contact ring for and arranged concentric with each of said shafts, each such contact ring being constituted by ten contact segments insulated from each other, each said contact segment corresponding to a different digital indicating position for the associated rotary shaft, rotary contact arms for and cooperative with each of said contact rings, said contact arms being adapted for attachment to said meter register shafts so as to establish contact with the contact segments on said rings, and a code pulse assembly having different pulse producing means characteristic respectively of the differently positioned contact segments of each contact ring, said code pulse assembly being comprised of a support of insulating material having thereon a plurality of conductor strips, a plurality of contact members for said conductor strips, and means effecting relative movement between said conductor strips and contact members to effect engagement therebetween, said contact members being connected respectively to the different contact segments on said contact ring such that each contact member will engage the same number of conductor strips as corresponds to the digital indicating position of the rotary contact arm.

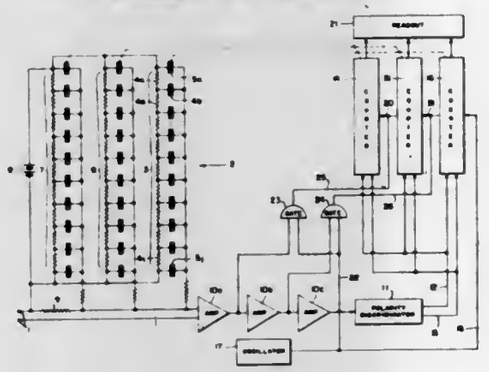
3,274,585
SHAFT ANGLE TO TIME INTERVAL CONVERTER
Joseph A. Faulkner and Clifford J. Black, Takoma Park, and Robert G. Rolfe, Rockville, Md., assignors to the United States of America as represented by the Secretary of the Navy
Filed Aug. 29, 1963, Ser. No. 305,564
8 Claims. (Cl. 340—347)



1. A system for converting an angle of shaft rotation into a time interval between output pulses comprising:

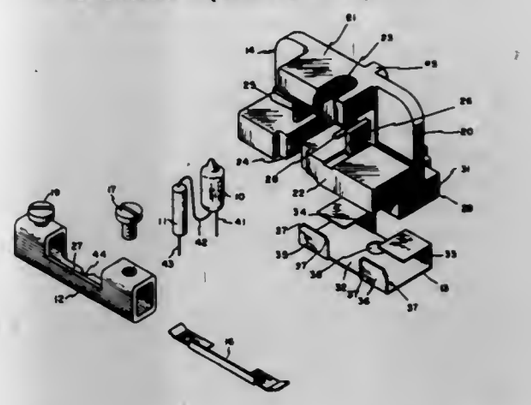
an analog-to-digital converter coupled to said shaft,

a binary counter circuit,



means connecting the output of said analog-to-digital converter to said binary counter circuit for presetting said binary counter circuit at a value commensurate with shaft rotation therein, and

a first source of timing pulses connected to said binary counting circuit whereby the count rate of said binary counter circuit is controlled by the spacing of said



timing pulses applied thereto and the binary number preset into said binary counter from said analog-to-digital converter.

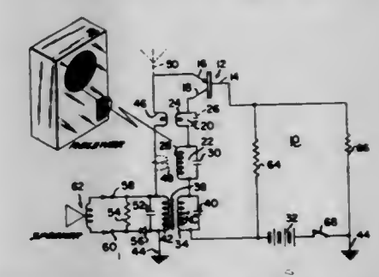
3,274,586
ELECTRICAL APPARATUS
Francis A. Lapinski, Ambler, Pa., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Oct. 22, 1963, Ser. No. 317,985
9 Claims. (Cl. 340—347)

1. An analog to digital converter comprising, a plurality of bidirectional counting means connected in series to form increasing decade steps whereby a completion of a count in either direction in one of said counting means is effective to transfer a count signal to a succeeding adjacent one of said counting means, said counting means each including selectively responsive control means operative to determine the direction of a count in the respective ones of said counting means, reference signal supply means controlled by said counting means and operative to supply a plurality of weighted steps in the magnitude of a reference signal in response to a count in a corresponding one of said counting means, signal comparing means operative to compare the reference signal with an unknown signal to be digitized to provide a difference signal having a magnitude representative of the error between said reference signal and said unknown signal and a polarity representative of the direction of said error, polarity discriminating means responsive to said difference signal to provide a control signal indicative of said polarity, means connecting said control signal to all of said control means to determine the direction of the count in said counting means, oscillator means connected to the first one of said counting means to provide signals to be counted thereby, and signal gate means responsive to a plurality of magnitudes of said difference signal and operative to selectively apply said signals from said oscillator means to ones of said counting means other than said first one in response to a corresponding magnitude of said difference signal.

3,274,587
COMBINED ELECTRICAL CONNECTOR AND INDICATOR
Murray A. Sanders, 40 Dianas Trail, Roslyn, N.Y.
Filed May 13, 1964, Ser. No. 366,950
6 Claims. (Cl. 340—381)

1. Combined electrical connector and indicator modules in which each module comprises

(a) an electrically nonconductive support member including a plate section having upper and lower spaced flanges extending from its surface, and a base section, said upper flange having an aperture therein,



(b) an electrically conductive primary conductor having spaced apart input and output terminals secured to said lower flange, said primary conductor electrically connecting said input and output terminals,

(c) an electrically conductive ground conductor secured to said base section, said ground conductor having a flat portion contiguous with the bottom of said base section and a plurality of tabs secured to the sides of said base section,

(d) an indicating lamp positioned in said aperture in said upper flange, and

(e) means electrically coupling said indicating lamp between said primary and ground conductors, said lamp being energized when a voltage is impressed between said primary conductor and said ground conductor.

3,274,588
SIMULTANEOUSLY MULTI-MODE OSCILLATOR SYSTEM
Page G. Brown, 1158 W. 54th St., Los Angeles, Calif.
Filed July 9, 1964, Ser. No. 381,444
5 Claims. (Cl. 340—384)

1. Multiple-mode oscillator circuit comprising:

an amplifier transistor having emitter, collector and control electrodes;

a battery having positive and negative terminals;

a common bus;

an audio output transformer having primary and secondary windings;

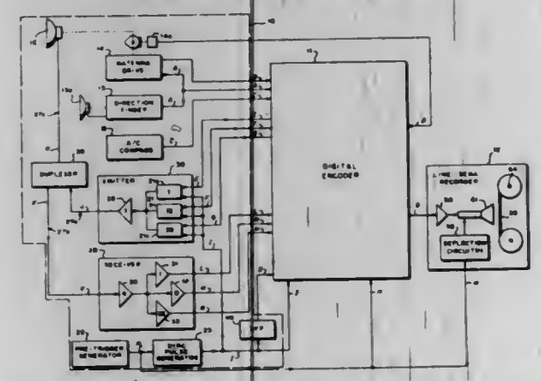
a pair of audio output terminals;

a first radio frequency coil resonant with its stray shunt capacitance to a first radio frequency and being coupled to said collector electrode;

a second radio frequency coil and shunt capacitor resonant to a second radio frequency and being

coupled in series with said first radio frequency coil, said first radio frequency being higher than said second radio frequency, and said first and second radio frequencies being non-harmonically related,

said primary winding of said audio frequency output transformer being intercoupled in series between said second radio frequency coil and said negative terminal of said battery, and said secondary winding of said audio transformer being coupled between said emitter electrode and said common bus;



a diode and load resistor coupled in series across the terminals of said secondary winding of said audio transformer,

said pair of output terminals being connected respectively to opposite ends of said load resistor;

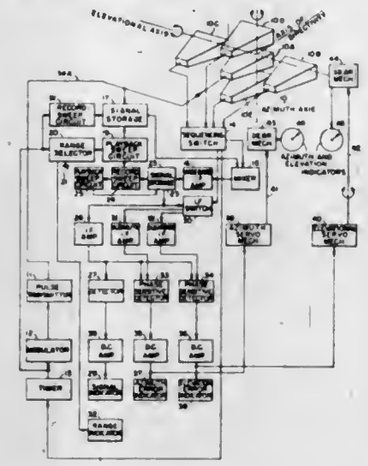
a voltage divider resistor network coupled between said positive and negative terminals of said battery with said control electrode of said transistor being connected to said network;

means for coupling said positive terminal of said battery to said common bus and feedback means interconnected between said emitter electrode and said secondary winding of said audio transformer and coupled to each of said first and second radio frequency coils.

3,274,589
ENCODING AND RECORDING APPARATUS
Thomas F. Droege, Kendall Park, N.J., and Ronald F. Sandler, Elkins Park, and Adolf Futterweit, Levittown, Pa., assignors to the United States of America as represented by the Secretary of the Navy
Filed Feb. 27, 1964, Ser. No. 347,965
6 Claims. (Cl. 343—6)

1. An airborne digital data encoding and video recording system for use with a controlled target comprising in combination:

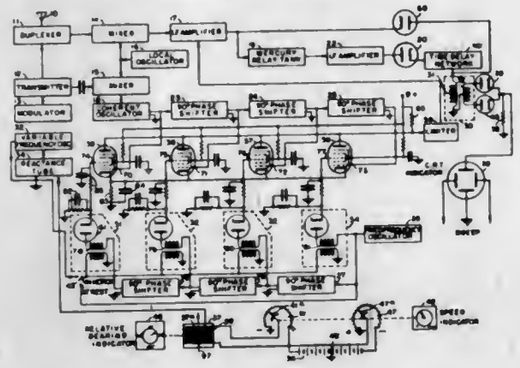
target locating means providing an output signal representative of target location,



a radar system including a transmitter, receiver and an antenna for detecting the target and having a video output signal indicative of the target and other targets comprising the target environment, said radar transmitter having a plurality of selectable transmission modes and said receiver having a plurality of compatible selectable receiving modes,

data processing means including switch means both for manually encoding slowly changing environmental and transmission conditions and for automatically encoding the selected transmission and receiving modes, said switch means having an output indicative of said conditions and said modes, said data processing means receiving and digitally encoding on a time-shared basis said output signal from said target locating means and said output signal from said switch means,

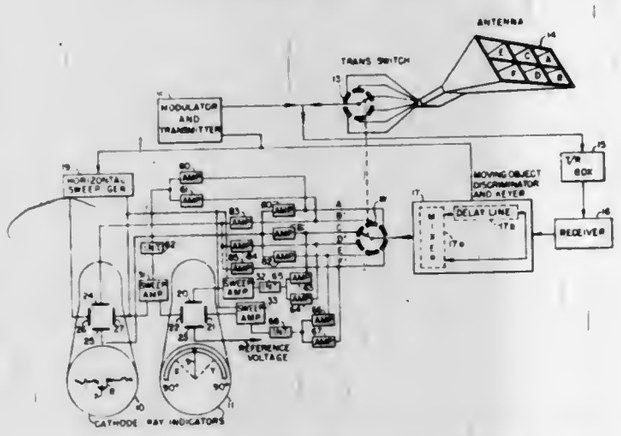
said data processing means time-sharing said digitally encoded time-shared signal with said video output signal, and



recording means receiving said combined time-shared signal for a line scan recording whereby a recording is obtained for use in selecting the optimum mode radar transmission for detecting a particular target under particular environmental conditions.

3,274,590
ANGLE TRACKING STORAGE RADAR SYSTEM
Robert M. Page, Camp Springs, Md.
(6715 Norview Court, Springfield, Va. 22150)
Filed Feb. 6, 1950, Ser. No. 142,681
8 Claims. (Cl. 343—7.4)

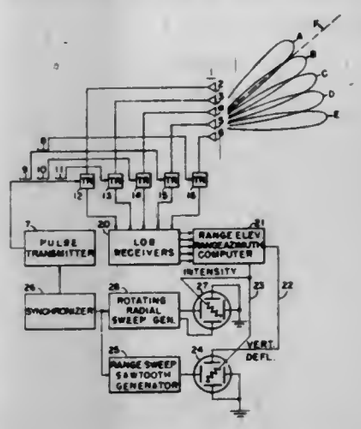
1. In an echo energy operative detection device having divergent, partly overlapping zones of reception, means alternately storing in carrier waves the signals received from said divergent, partly overlapping zones of reception during successive short duration widely separated time intervals, playback means reproducing the stored signals during substantially the entire time spacing between the successive short duration time intervals, a narrow bandwidth carrier wave signal integrating circuit, and signal delivery means applying the reproduced signal from the playback means to the integrating circuit in one polarity for one zone of reception and in opposing polarity for the opposing zone of reception.



3,274,591
PHASE ROTATION SYSTEM FOR USE IN VELOCITY CANCELLATION MOVING TARGET RADAR SYSTEMS
Torrence H. Chambers, 3729 S St. SE., Washington, D.C.
Filed May 8, 1947, Ser. No. 746,847
7 Claims. (Cl. 343—7.7)

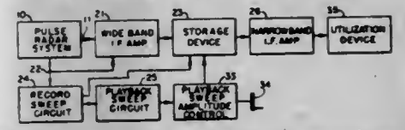
1. In an echo-ranging system for detecting moving objects by comparing consecutive echo pulses after they have been vectorially added with a locally generated signal having a fixed phase relationship to the transmitted pulse, compensating means for balancing out the component of relative motion between the system and an object

produced by motion of the system comprising, an oscillation generator coherent to the system for providing said locally generated signal, three phase shifting means serially connected thereto and reproducing said generator's output in phase quadrature components, four normally non-conducting vacuum tube amplifier means respectively receiving said generator output in phase quadrature, a mutual output means therefor, means for sequentially triggering said vacuum tube amplifiers at a rate in accordance with said relative motion produced by motion of the system, said last named means comprising a fixed frequency oscillator and a variable frequency oscillator, the frequency of said variable frequency oscillator being varied in accordance with said component of relative motion produced by the motion of the system, and means for controlling the rate of sequential triggering of said vacuum tube amplifiers in accordance with the frequency difference between said fixed and said variable frequency oscillators, and means for combining the output of said mutual output means with the echo pulses.



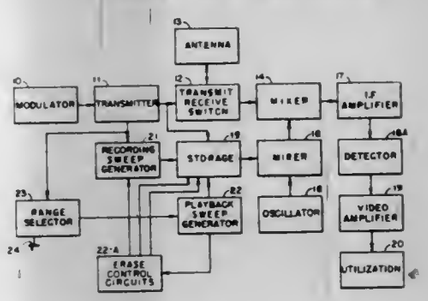
3,274,592
PULSE ECHO MOVING OBJECT LOCATOR SYSTEM
Roger R. Crane, Washington, D.C. (% Massachusetts Institute of Technology, Cambridge, Mass.)
Filed Oct. 7, 1948, Ser. No. 53,327
5 Claims. (Cl. 343—11)

1. A pulse echo moving object locator system comprising a directive antenna array including a plurality of feeds operative to provide a plurality of overlapping zones of radiation and reception so disposed to produce at least a pair of equal signal intensity axes, a radio pulse transmitter and receiver, said transmitter being operative to periodically emit radio frequency pulses, switching means for sequentially connecting said transmitter and receiver to said feeds in such manner as to permit the radiation of one pulse and the reception of echoes therefrom from one antenna feed at a time in sequence, a moving object discriminator circuit means operative to cancel echoes obtained from stationary objects lying in any particular zone of reception fed by the output of said receiver, and means operatively connected to said moving object discriminator circuit for indicating the reception of energy reflected from moving objects.



3,274,593
HEIGHT FINDING RADAR SYSTEM
Arthur A. Varela, Alexandria, Va. (Naval Research Laboratory, Anacostia Station, Washington 25, D.C.), and Elvin E. Herman, 6864 Glacier Drive, Riverside, Calif.
Filed Mar. 26, 1953, Ser. No. 344,912
9 Claims. (Cl. 343—16)

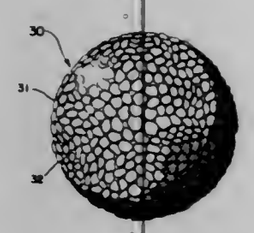
1. Target locating apparatus comprising a radio transmitter for radiating energy in a selected direction, a receiving antenna array providing more than two stacked-beam patterns with an overlap on adjacent beams for receiving said energy after reflection from a remote target, logarithmic comparison means coupled to said antenna array for generating respective voltages proportional to the relative amplitude of instantaneous energy received



on each pair of adjacent beams, means for respectively deriving the absolute value of said voltages and means coupled to said derivation means and responsive to the absolute value voltage outputs therefrom to select the pair of adjacent beams between which a target is located.

3,274,594
SIGNAL INTEGRATING RADAR SYSTEM
Robert M. Page, Camp Springs, Md.
(6715 Norview Court, Springfield, Va. 22150)
Filed Dec. 27, 1949, Ser. No. 135,215
20 Claims. (Cl. 343—17.1)

1. A radar system comprising, transmitter means recurrently emitting short duration pulses of carrier frequency energy, receiver means intercepting return energy, radio frequency storage means retaining in a carrier frequency signal form signals returned with selected time delay after each emitted pulse, and means reproducing retained signals in carrier frequency signal form with phase coherence between successive reproduced signals.

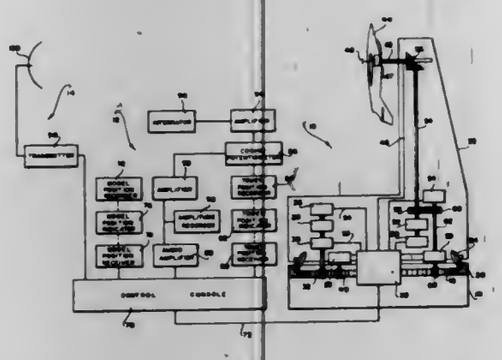


3,274,595
FREQUENCY MODULATED PULSE RADAR SYSTEM
Robert M. Page, Camp Springs, Md.
(6715 Norview Court, Springfield, Va. 22150)
Filed Apr. 13, 1950, Ser. No. 155,773
7 Claims. (Cl. 343—17.2)

1. In a pulse echo locator system having reduced susceptibility to interference the combination of frequency modulation transmitter means for producing radio frequency pulse signals possessing carrier frequency modulations therein, an antenna system connected to the transmitter means for emitting generated pulse signals and

for intercepting return signals, storage means for recording the pulse signals, playback means for controlling the reproduction of recorded pulse signals in coincidence with the receipt of return signals from a selected range, and mixing means for combining reproduced signals and return signals to obtain cancellation of frequency modulations in the return signals.

3,274,596
BLISTERED SKIN PASSIVE SATELLITE
Herbert P. Raabe, St. Paul, Minn., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Nov. 30, 1964, Ser. No. 414,933
3 Claims. (Cl. 343—18)



1. A passive communication satellite adapted for an orbital path and for reflecting electromagnetic energy from a source on the earth to a receiver remote from the source, comprising:

(a) a body having an electromagnetic reflective skin;

(b) said body including means defining a plurality of mutually related isotropic reflectors made by said skin being laminated for increased strength and randomly sealed along lines wherein said isotropic reflectors are generally hemispherical in shape; and

(c) said reflectors being ramdomly phased whereby the energy effectively reflected by the satellite is substantially greater than for a similar sized specular satellite.

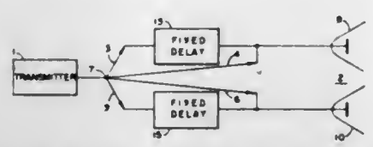
3,274,597
METHOD AND APPARATUS FOR EVALUATING ANTENNAE
Alton M. Archer, Van Nuys, and Richard G. Wyatt, San Fernando, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.
Filed May 7, 1963, Ser. No. 278,682
9 Claims. (Cl. 343—100)

9. In an apparatus for evaluating an antenna, means for mounting said antenna so that it is continuously rotatable about first and second orthogonal axes, first means for driving said antenna so that it rotates about said first axis, second means for driving said antenna for rotation about said second axis, radiator means for radiating radio frequency energy toward said antenna, means for measuring the energy received by said antenna, cosine potentiometer means driven by rotation of said antenna about one of said axes, the energy received by said antenna being fed through said cosine potentiometer, and integrator means connected to the output of said cosine potentiometer to integrate the received signal.

3,274,598
DIRECTIVE RESPONSE TRANSPONDER SYSTEM
Claud E. Cleeton, 2424 34th St. SE., Washington, D.C. 20020
Filed Feb. 26, 1964, Ser. No. 347,625
8 Claims. (Cl. 343—100)

1. A transponder system comprising:

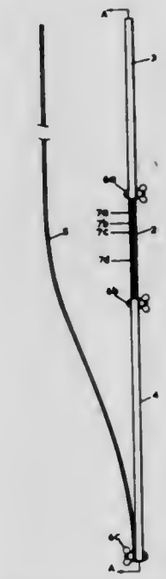
control station means including a receiver and a transmitter for transmitting a first electrical signal having certain characteristics;



a transponder unit located on a vehicle;

an array of directional antennas and directional control means included in said transponder unit, said directional control means being operatively coupled to said array to maintain said array in a predetermined spatial orientation;

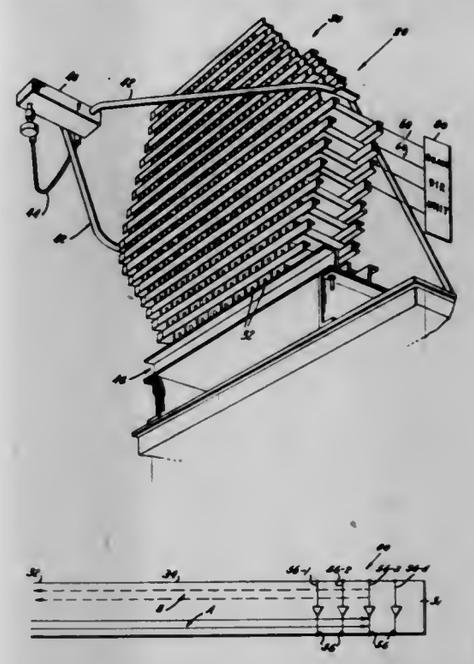
signal generator means included in said transponder unit and responsive to some of said certain characteristics of said first signal to generate a second signal and



antenna control means included in said transponder unit and responsive to other of said certain characteristics of said first signal to cause said second signal to be transmitted by only a selected one antenna of said array.

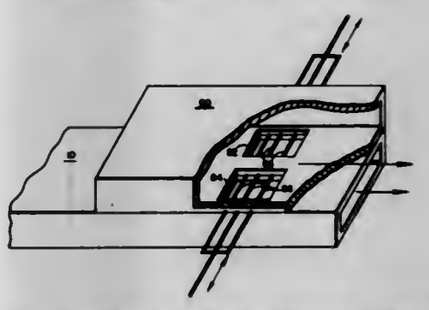
3,274,599
RADIO DIRECTION FINDER SYSTEM
Robert M. Page, Camp Springs, Md. (6715 Norview Court, Springfield, Va. 22150)
Filed Feb. 21, 1952, Ser. No. 272,875
10 Claims. (Cl. 343—112)

1. A system for determining the azimuth of a vehicle relative to a reference point comprising transmitter means for generating an output signal of random frequency composition, first and second respective antenna means for radiating signals from said reference point in respective directive patterns having angularly overlapping lobes whose angle of overlap defines a selected azimuthal sector, means supplying said first antenna with a pair of signals each identical to said transmitter output signal and having a first time spacing, means supplying said second antenna with a pair of signals each identical to said transmitter output signal but having a second time spacing, whereupon the radiation patterns of said two antennas are identifiable by the time spacing of the signals in a pair, receiving means in said vehicle for receiving each of said pairs of signals and deriving a respective output voltage proportional to the amplitude of the signals in each of said respective pairs, and means for comparing said respective output voltages to determine the relative azimuthal position of said vehicle within said selected azimuthal sector.



3,274,600
REACTIVELY LOADED BROADBAND ANTENNA FOR USE IN THE 10 THROUGH 160 METER BANDS
George Alfred Partridge, 17 Ethel Road, Broadstairs, England
Filed Feb. 14, 1963, Ser. No. 258,592
6 Claims. (Cl. 343—749)

1. A broadband transmitting and receiving radio aerial having high efficiency over the 10 through 160 meter bands without the need of electrical or mechanical adjustment to the aerial, comprising an inductance coil wound on an elongated former of insulating material, said coil having a fixed inductance of substantially 35 to 43 microhenries, a first elongated radiating member positioned on one end of said former and colinear therewith, a second elongated radiating member positioned on the other end of said former and colinear therewith, the length of said first radiating member being substantially 3 feet 8 inches and the length of said second radiating member being substantially 2 feet 8 inches, means forming an electrical connection between each end of said coil and the adjacent end of the corresponding radiating member, and means for connecting a feeder to said first radiating member at a position adjacent the end of said first radiating member remote from said coil.



3,274,601
ANTENNA SYSTEM WITH ELECTRONIC SCANNING MEANS
Judd Blass, Bayside, N.Y., assignor to Blass Antenna Electronics Corporation, Long Island City, N.Y., a corporation of Delaware
Filed Dec. 12, 1962, Ser. No. 244,089
17 Claims. (Cl. 343—754)

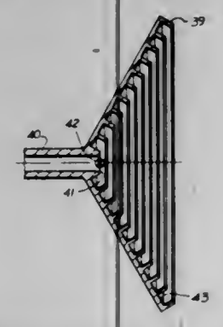
1. In combination in an antenna system, a reflecting surface and a signal feed; scanning means cooperatively associating said reflecting surface with respect to said signal feed to effect an antenna beam orientation in a desired direction; said reflecting surface formed of a plurality of radiating elements, each associated with a branch signal channel; said radiating elements operatively positioned with respect to said signal feed to present a plurality of branch wave signals therebetween; said radiating elements positioned at a first end region of said branch signal channels; individual signal reflecting means at a second end region of each of said branch signal channels; said branch wave signals traversing a path from said radiating elements at said first end region, towards said second end region, and from said reflecting means at said second end region oppositely directed back toward

said first end region; adjusting means individually controlling the characteristics of said plurality of reflecting means whereby the phase of said branch wave signals at each of said first end regions may be individually varied; the additive phase effect of said branch wave signals establishing said desired direction of antenna beam orientation, said reflecting means including shorting means, said adjustment means selectively positioning said shorting means along the second end region of said branch signal channels, whereby the overall lengths of selected ones of said branch signal paths are varied.

3,274,602
ANTENNA HAVING VARIABLE BEAMWIDTH ACHIEVED BY VARIATION OF SOURCE WIDTH
Grant M. Randall, Whittier, and Jerry A. Algeo, Buena Park, Calif., assignors to North American Aviation, Inc.
Filed Sept. 16, 1963, Ser. No. 309,002
3 Claims. (Cl. 343—762)

1. In a horn-type microwave antenna having a main waveguide terminal horn portion, one open end of which is adapted to cooperate with an antenna dish and an opposite end of which is adapted to be connected to a feed-horn, variable aperture means comprising

an auxiliary terminal horn portion, one end of which is open and adapted to cooperate with said antenna dish and an opposite end of which is closed, said auxiliary horn portion having one wall thereof contiguous with a wall of said main horn portion;



coupling slot means in said contiguous walls and intercoupling said main and auxiliary terminal horn portions in microwave circuit; and

switchable shortcircuiting impedance means mounted in said coupling slot means and oriented for selectively decoupling said intercoupled terminal horn portions.

3,274,603
WIDE ANGLE HORN FEED CLOSELY SPACED TO MAIN REFLECTOR

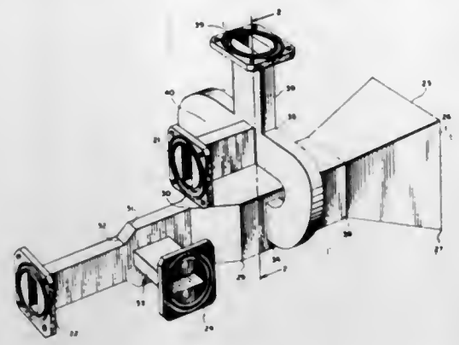
Alan F. Kay, Cambridge, Mass., assignor, by mesne assignments, to Control Data Corporation, South Minneapolis, Minn., a corporation of Minnesota

Filed Apr. 3, 1963, Ser. No. 270,330
The portion of the term of the patent subsequent to Nov. 2, 1982, has been disclaimed and dedicated to the Public
7 Claims. (Cl. 343—781)

1. A primary microwave antenna for use in an antenna system having a focusing wave translation means with a bounded illumination aperture and a focal point, said focal point and said illumination aperture boundary defining an illumination angle, comprising:

primary wave translation means including a primary member having a bounded, plane-defining, primary wave translation aperture formed therein and tapered wave translation conductive surfaces defining with said aperture a primary wave translation aperture angle having an apex at an internal focal point, the maximum dimension from said apex to said aperture minus the minimum dimension from said apex to said aperture being greater than one half wavelength of translated energy;

radiation suppression means formed in said primary wave translation surfaces, said suppression means including a plurality of transversely disposed, uniformly spaced grooves, the width of each said groove being greater than one quarter wavelength, the spacing between said grooves being less than one quarter wavelength, and the groove-to-groove spacing being approximately one half wavelength; and



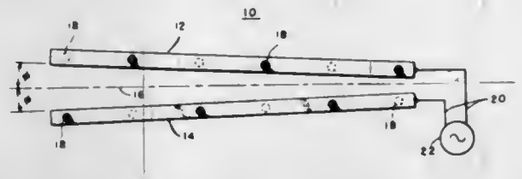
wave transmission means for coupling said member to a source of microwave energy.

3,274,604
MULTI-MODE SIMULTANEOUS LOBING ANTENNA

Bernard L. Lewis, Winter Park, Fla.
(1239 Seminole Drive, Satellite Beach, Fla.)

Filed Dec. 12, 1958, Ser. No. 780,175
5 Claims. (Cl. 343—786)

5. In a radio energy operative locator system, a rectangular waveguide capable of supporting energy propagation in the TE_{10}, TE_{20}, TE_{11} and TM_{11} modes, said waveguide having an open end orientable in the direction of receipt of radio energy, means separately extracting energy from said waveguide in dependency on the TE_{10}, on the TE_{20} and the combined TE_{11} and TM_{11} modes



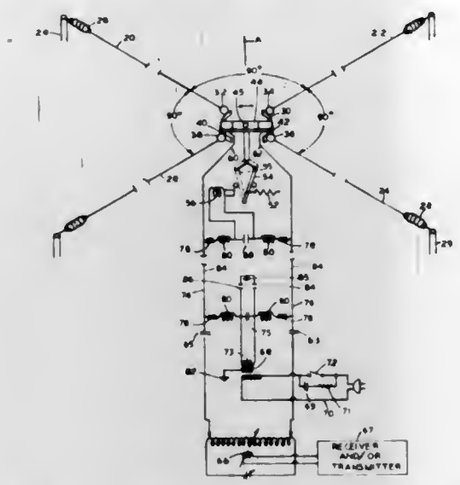
existing therein, and means deriving error signals in proportion to the relationship of the TE_{20} and combined TE_{11} and TM_{11} to the TE_{10} signals.

3,274,605
COPLANAR LOG PERIODIC DIPOLE ARRAY

Alexander Rauch, Red Bank, N.J., assignor to the United States of America as represented by the Secretary of the Army

Filed June 7, 1963, Ser. No. 286,431
1 Claim. (Cl. 343—792.5)

A wideband constant impedance logarithmically periodic antenna comprising a pair of open ended linear coplanar conductors spaced symmetrically about an axis, each of said conductors having its open end spaced further from said axis than its feed end so as to from an appreciable acuate angle having an upper limit of .5° between each said conductor and said axis, a plurality of straight open ended radiating elements logarithmically spaced along said conductors at right angles to the plane of said conductors and having successive ones of said elements extending in alternate directions from opposite sides of said plane, the length of said radiating elements decreasing logarithmically from said open end to said feed end, said conductors and radiating elements being arranged in two-fold symmetry about said axis and transmission line means connected directly across said feed ends of said antenna.



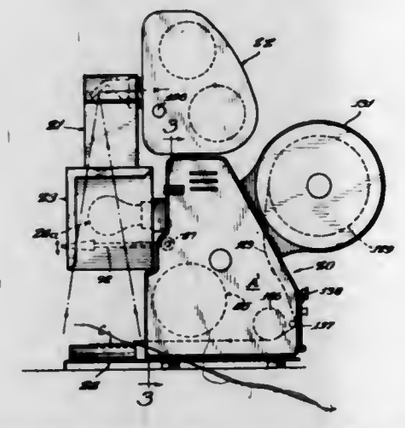
3,274,606
ANTENNA SYSTEM

George A. Bonadio, 373 East Ave., Watertown, N.Y.

Filed Jan. 15, 1964, Ser. No. 337,812
2 Claims. (Cl. 343—854)

1. An antenna system for radio transmission and reception comprising a generally horizontal system consisting of four single filamentary conductors of equal length extending radially and generally horizontal at horizontal angles of 90 degrees from one another from a central area and in alignment with a common center in said area, each of said conductors being insulated from one another and having their central area inner ends equally spaced from the common center, a double-pole double-throw two position switch disposed within the central area, said switch having four contacts equally

spaced around a circle concentric with the common center and having one contact connected to a lead-in of a transmission line, and connected at all times to the inner end of a first one of said conductors, and another contact connected to a second lead-in of a transmission line, and connected at all times to the inner end of a second one of said conductors extending in the opposite direction to said first conductor, and the other two contacts connected to the inner ends of the two intermediate conduc-

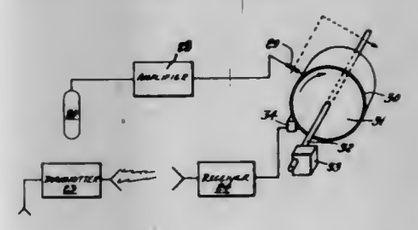


tors respectively whereby in one position or the other of said switch one of said intermediate conductors is connected to either of said first or said second conductor, when the other of said intermediate conductors is connected to either the second or said first conductor, whereby the radiation pattern of said antenna may be substantially instantly shifted exactly 90 degrees by actuation of said switch from one position to the other without altering the constants of the antenna system.

3,274,607
COMBINATION MICROFILM PHOTOGRAPHIC AND PRINTING APPARATUS FOR PHOTOGRAPHICALLY RECORDING TRANSACTIONS AND DISPENSING PRINTED MEMORANDA OF THE SAME

Clarence F. Muchow, Broadview, Juan R. Blanco, Roselle, and Donald G. Disney, Chicago, Ill., assignors to Rapidex Corp., New York, N.Y., a corporation of New York

Filed June 23, 1964, Ser. No. 377,217
23 Claims. (Cl. 346—24)



19. Recording apparatus comprising a camera, a light source, means disposed within the range of said camera for supporting an object to be photographed, a rotatable printing cylinder carrying type characters, a printable tape movable over a surface into engagement with said printing cylinder, means for feeding said tape over said surface, drive means including an intermittently operating motor, means operatively connected to said drive means for operating said camera and said light source during a portion of the rotational cycle of said printing cylinder, means for automatically arresting rotation of said printing cylinder upon completion of a single rotational cycle, means connecting said drive means to said tape feeding means, means for inking said type characters, means for maintaining said inking means in non-operative relationship to said printing cylinder during non-operation of the apparatus, a cutter blade disposed transversely to the direction of movement of said tape for cutting said tape, and means operatively connected to said drive means for actuating said cutter blade.

3,274,608
SEISMIC PROFILER

John I. Ewing, Palisades, and Albert Stockel, Jr., Bayville, N.Y., assignors to the United States of America as represented by the Secretary of the Navy

Filed May 4, 1964, Ser. No. 364,869
1 Claim. (Cl. 346—33)

In an apparatus for seismic profiling wherein a plurality of seismic traces are arranged in parallel relation on a record medium having a cylindrical record supporting drum adapted for mounting said record medium circumferentially thereon, means for recording thereon said traces, that improvement for providing a common datum reference which comprises:

a rotatable shaft coaxial with said drum,

means for rotating said shaft,

clutch means disposed on opposite ends of said drum and carried by said drum and said shaft coupling said shaft and drum for rotation thereof,

said clutch means including a first disc carried by said shaft,

a second disc carried by said drum, and

means urging said discs into contact,

stop means for selectively holding said drum stationary while said shaft rotates,

said stop means including

a first member carried by said drum,

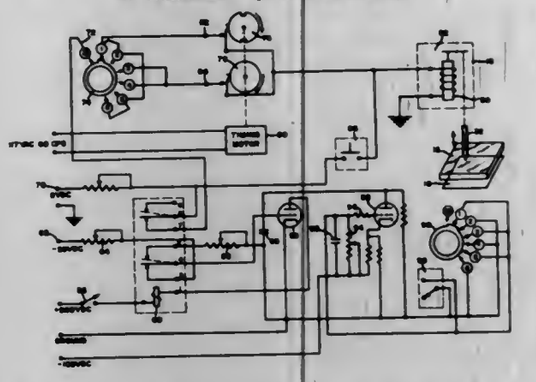
a second stationary member having a portion movable to engage and disengage with said first member to prevent rotation of said drum,

electrical means for releasing said stop means upon the occurrence of an event for a selected number of complete revolutions of said drum,

said electrical means including

an electrical solenoid having a movable actuating member coupled to said portion for moving the same into and out of the path of said first member and means for actuating said solenoid,

said event being the initiation of a seismic wave at a point remote from said apparatus and further including



a transmitter at said remote point,

a receiver having its output coupled to actuate said solenoid whereby at the instant said wave is initiated, a signal will be transmitted by said transmitter, received by said receiver and simultaneously start said drum rotating.

3,274,609
VIBRA-PEN SCRIBER ASSEMBLY

Stephen E. Boone, Mission Hills, Calif., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Original application Apr. 7, 1961, Ser. No. 101,604, now Patent No. 3,125,401, dated Mar. 17, 1964. Divided and this application Feb. 19, 1964, Ser. No. 356,342
4 Claims. (Cl. 346—62)

1. A system for inscribing lines on surfaces to indicate the flight path and speed of vessels comprising,

a recorder means,

a plurality of information channels coupled in parallel to said recorder means,

channel identifying means directly coupled to said plurality of information channels,

timing means, said timing means comprising

a first electronic valve means having a control grid,

time delay circuit means coupled to said control grid for controlling the conduction of said first valve means, and

a first switching means coupled to said first valve means responsive to the operation of said first valve means to sequentially activate and deactivate the timer,

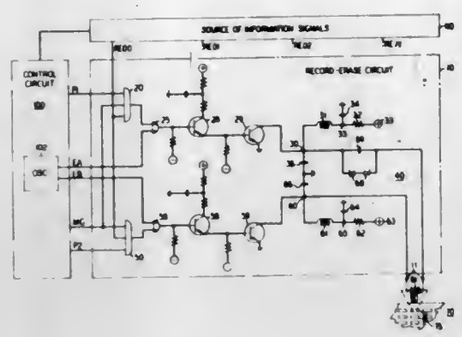
selective means directly coupling said timing means to one of said plurality of information channels, and

recorder interrupting means coupled to said timing means operative during an information channel change, said recorder interrupting means comprising,

a second electronic valve means having a control grid,

a load coupled to said second valve and to the control grid of said first valve means,

a second time delay circuit means coupled to the control grid of said second valve means for controlling the conduction of said second valve means, and

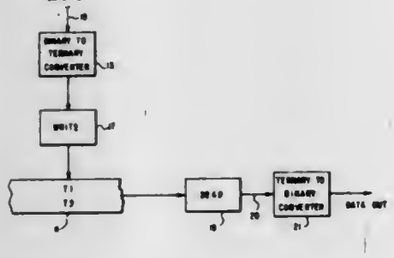


a second switching means coupled to said selective means for pulse biasing said second valve means to conduction and simultaneously decoupling said timing means from the selective means during transition of information channels thereby interrupting the recording.

3,274,610
INFORMATION RECORDING CIRCUIT

Cyrus F. Ault, Lincroft, and David Friedman, Red Bank, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Mar. 21, 1963, Ser. No. 266,959
11 Claims. (Cl. 346—74)



4. A magnetic recording circuit for selectively magnetizing and demagnetizing discrete portions of a magnetic medium, comprising a transducer having a single winding, means for applying alternating current to said winding, means selectively operable for providing a direct-current signal to said winding coincident with a current peak of said alternating current and for thereafter damping said alternating current quickly to a quiescent level, blocking means in circuit with said transducer winding for normally preventing the flow of direct current in said transducer winding, and means in shunt with said blocking means for providing a path for said direct-current signal.

3,274,611
BINARY TO TERNARY CODE CONVERSION RECORDING SYSTEM

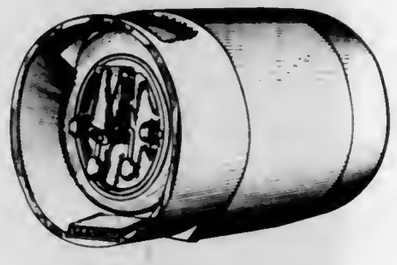
David T. Brown, Wappingers Falls, and Frederick F. Sellers, Jr., Hopewell Junction, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 27, 1963, Ser. No. 333,820
5 Claims. (Cl. 346—74)

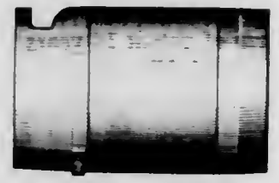
1. In a magnetic recording system, the combination comprising:

conversion means for converting binary signals to be written onto a magnetic storage medium into a ternary representation, said conversion means producing an output signal which is the combination of two binary digits for each ternary digit, each ternary digit including at least one binary digit that is a binary "ONE"; and

write means connected to said conversion means for writing said ternary digits onto said storage medium, said write means including means for causing phase reversal of magnetic flux on said storage medium for each binary "ONE" digit included in a ternary digit, whereby ternary information is recorded onto said storage medium with at least one flux reversal for each ternary digit.



DESIGNS



SEPTEMBER 20, 1966

205,750
BEVERAGE DISPENSING TANK OR SIMILAR ARTICLE

Richard T. Cornelius, Minneapolis, Minn., assignor to The Cornelius Company, Anoka, Minn., a corporation of Minnesota

Filed Jan. 5, 1966, Ser. No. 471
Term of patent 14 years
(Cl. D2—3)

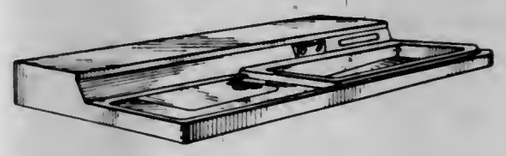
205,751
RUBBER GLOVE

Mal Greenberg, Wichita, Kans., assignor to Meco, Inc., Wichita, Kans.

Filed Sept. 23, 1965, Ser. No. 87,148
Term of patent 14 years
(Cl. D3—11)

205,752
HAT

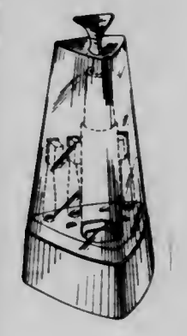
Marvin I. Malk, Denver, Colo., assignor to Imperial Cap Works, Inc., Denver, Colo., a corporation of Colorado



Filed Feb. 28, 1966, Ser. No. 1,207
Term of patent 14 years
(Cl. D3—13)

205,753
COMBINATION COUNTERTOP AND SINK

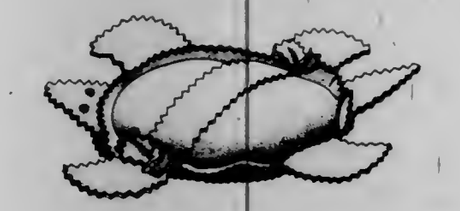
Robert W. Fink, Benton Harbor, Mich., assignor to Whirlpool Corporation, a corporation of Delaware



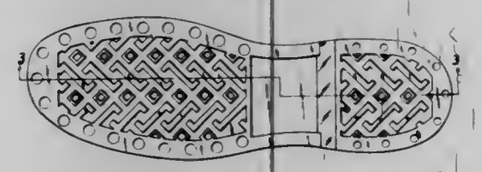
Filed Sept. 23, 1965, Ser. No. 87,137
Term of patent 14 years
(Cl. D4—2)

205,754
COMBINED HOLDER AND CHARGING UNIT FOR ELECTRIC TOOTHBRUSH OR THE LIKE

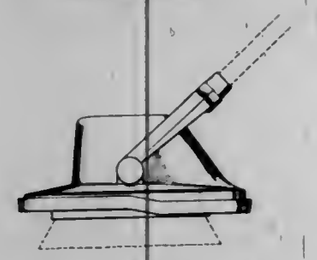
Richard B. Hall, Cincinnati, Ohio, assignor to Dominion Electric Corporation, a corporation of Ohio



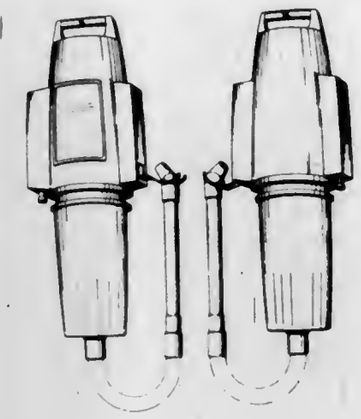
Filed Oct. 21, 1965, Ser. No. 87,689
Term of patent 14 years
(Cl. D4—3)



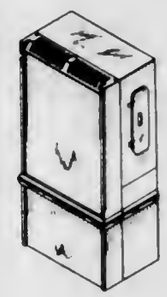
205,755
OVERSHOE
Duncan E. Slade, Naugatuck, Conn., assignor to United States Rubber Company, New York, N.Y., a corporation of New Jersey
Filed Dec. 3, 1965, Ser. No. 38
Term of patent 14 years
(Cl. D7—4)



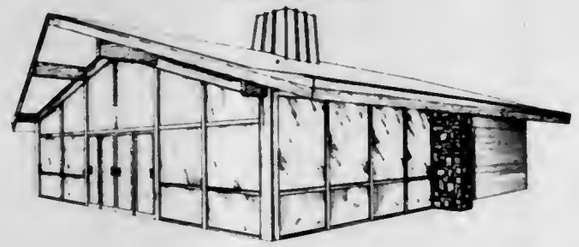
205,756
BATH SPONGE
Fanny Triplett, Ray, Ohio, assignor to Trippies, Ray, Ohio, a partnership
Filed Dec. 22, 1965, Ser. No. 294
Term of patent 14 years
(Cl. D9—2)



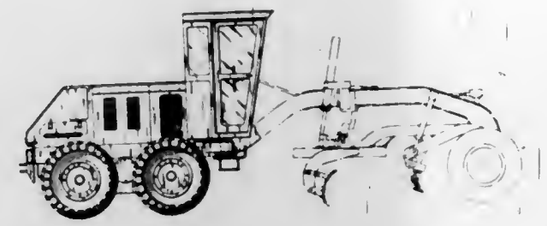
205,757
FOOTWEAR SOLE
William Virgil Wakeland, Rock Island, Ill., assignor to The Servus Rubber Company, Rock Island, Ill., a corporation of Illinois
Filed July 6, 1965, Ser. No. 86,029
Term of patent 7 years
(Cl. D7—5)



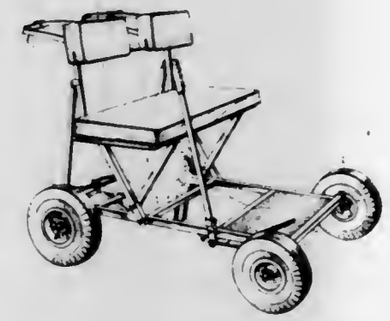
205,758
FLOOR TREATING MACHINE
Frederick K. Storm, Jr., Glendale, Calif., assignor to Orbitor, Ltd., a limited partnership
Filed Feb. 16, 1966, Ser. No. 1,080
Term of patent 14 years
(Cl. D9—2)



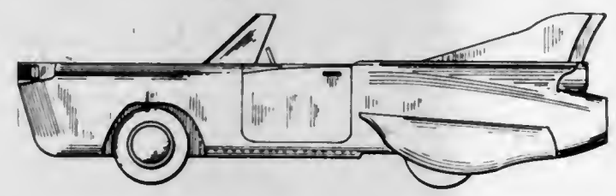
205,759
VACUUM CLEANER
Herbert La Mers and Maury W. Wayne, Los Angeles, Calif., assignors to California Car Wash Systems Inc., Sun Valley, Calif., a corporation of California
Filed July 28, 1965, Ser. No. 86,326
Term of patent 14 years
(Cl. D9—2)



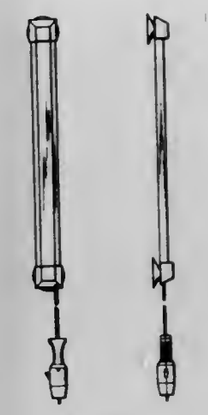
205,760
COMBINATION AIR FILTERING AND COLLECTING UNIT FOR TEXTILE WASTE PRODUCTS
R. Hovan Hocutt and Thomas E. Mullinax, Charlotte, N.C., assignors to Pneumafil Corporation, Charlotte, N.C., a corporation of Delaware
Filed Aug. 27, 1965, Ser. No. 87,198
Term of patent 14 years
(Cl. D9—2)



205,761
BUILDING
Edward C. Bridger, Annandale, Va., assignor to Marriott-Hot Shoppes, Inc., Washington, D.C., a corporation of Delaware
Filed Jan. 18, 1966, Ser. No. 667
Term of patent 14 years
(Cl. D13—1)



205,762
VEHICLE
Robert E. Gerber, Marion, Ohio, assignor to Huber-Warco Company, Marion, Ohio, a corporation of Ohio
Filed June 30, 1964, Ser. No. 80,652
Term of patent 14 years
(Cl. D14—3)



205,763
GOLF CART
Bernard E. Post, 424 S. 12th, Clear Lake, Iowa
Filed July 2, 1965, Ser. No. 86,012

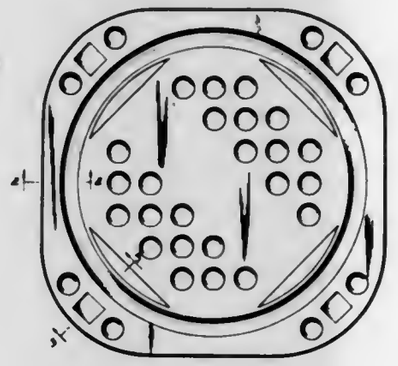
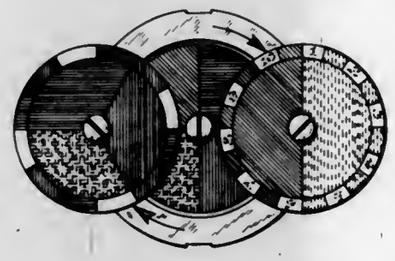
FISH LURE
Joseph L. Schneider, 2544 E. 21st St., Brooklyn, N.Y.
Filed Jan. 27, 1966, Ser. No. 787
Term of patent 14 years
(Cl. D31—4)

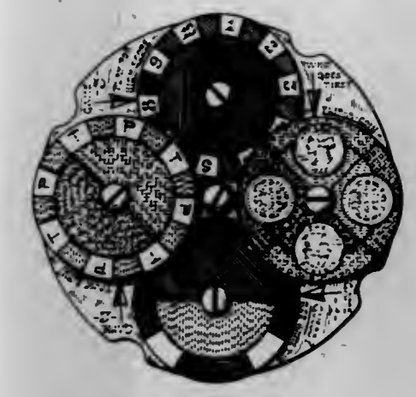


205,774
FISH LURE
Joseph L. Schneider, 2544 E. 21st St., Brooklyn, N.Y. 11235
Filed Jan. 27, 1966, Ser. No. 783
Term of patent 14 years
(Cl. D31—4)

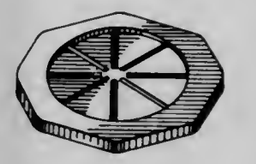
205,775
SUSPENSION HOOK FOR A CLOTHES HANGER ROD
Carl E. Gingher, 304–328 Depot St., Scranton, Pa.
Filed Sept. 11, 1964, Ser. No. 81,682
Term of patent 14 years
(Cl. D33—8)

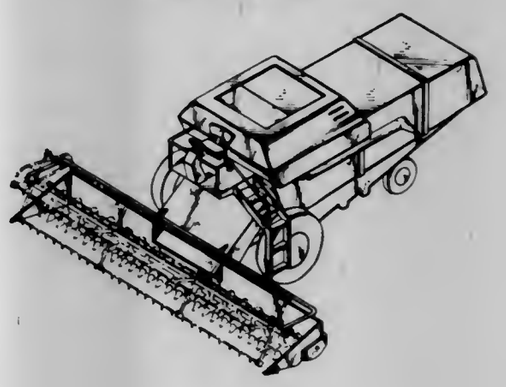


205,776
GAME BOARD
William F. Boubel, 1116 NE. 21st Ave., Portland, Oreg.
Filed Jan. 21, 1966, Ser. No. 720
Term of patent 7 years
(Cl. D34—5)



205,777
COMBINED AMUSEMENT AND GAME DEVICE
Alfred E. Ischinger, 410 Kenhorst Blvd., Reading, Pa. 19602
Filed July 20, 1964, Ser. No. 80,918
Term of patent 14 years
(Cl. D34—5)





205,778
GAME DEVICE
Alfred E. Schinger, 410 Kenhorst Blvd., Reading, Pa. 19602
Filed Apr. 7, 1965, Ser. No. 84,649
Term of patent 14 years
(Cl. D34—5)

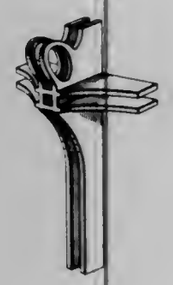
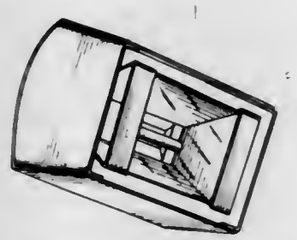
HARVESTING MACHINE
Cornelis van der Lely, Zug, Switzerland, assignor to Texas Industries Inc., Willemstad, Curacao, Netherlands Antilles, a limited-liability company of the Netherlands Antilles
Filed May 19, 1965, Ser. No. 85,408
Claims priority, application Great Britain Nov. 26, 1964
Term of patent 14 years
(Cl. D40—1)



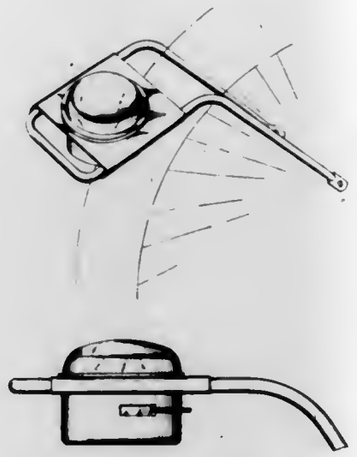
205,781
BEVERAGE SERVER OR THE LIKE
Howard C. Valle and Samuel E. Hatchett, San Diego, and Raymond E. Gust, Spring Valley, Calif., assignors to Courtesy Products Corporation, San Diego, Calif.
Filed Oct. 18, 1965, Ser. No. 87,556
Term of patent 14 years
(Cl. D44—21)

205,782
FINGER RING
John L. Hazelquist, Garden City, Mich., assignor to Traub Manufacturing Company, Detroit, Mich., a corporation of Michigan
Filed Jan. 14, 1966, Ser. No. 608
Term of patent 14 years
(Cl. D45—10)

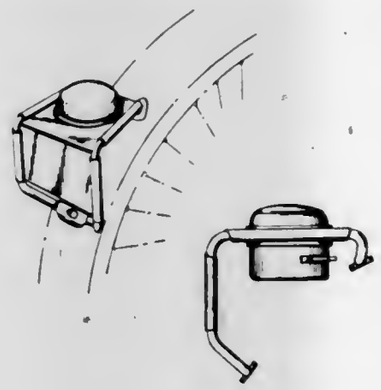
205,783
PENDANT CROSS OR THE LIKE
Arthur Albanese, Cranston, R.I., assignor to Marvel Jewelry Mfg. Company, Providence, R.I., a corporation of Rhode Island
Filed Oct. 4, 1965, Ser. No. 87,308
Term of patent 14 years
(Cl. D45—16)



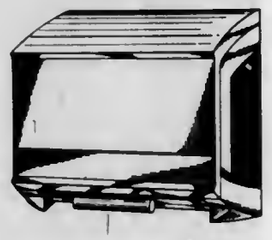
205,784
LIGHTING FIXTURE ADAPTOR
Nathan R. Schwartz, Yonkers, N.Y., assignor to Swivelier Company, Inc., Nanuet, N.Y., a corporation of New York
Filed Mar. 3, 1965, Ser. No. 84,063
Term of patent 14 years
(Cl. D48—4)



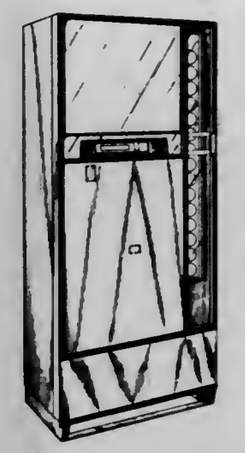
205,785
HIGH INTENSITY LAMP
Richard B. Cronheim, 709 S. Skinker St., St. Louis, Mo.
Filed Nov. 17, 1965, Ser. No. 88,129
Term of patent 14 years
(Cl. D48—20)



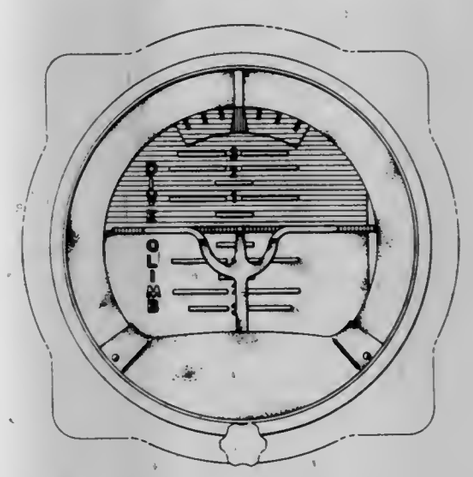
205,786
HOUSING FOR AN INDOOR LIGHT FIXTURE OR THE LIKE
George D. Cooper, 1136 Vista Place, Edmonds, Wash.
Filed May 28, 1965, Ser. No. 85,490
Term of patent 14 years
(Cl. D48—20)



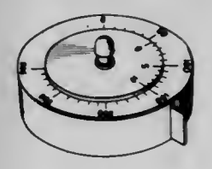
205,787
BICYCLE LIGHT
Viktor Schreckengost, 2265 Stillman Road, Cleveland Heights 18, Ohio
Original design application June 15, 1964, Ser. No. 80,397, now Design Patent No. 203,064, dated Nov. 3, 1965. Divided and this application Aug. 6, 1965, Ser. No. 87,045
Term of patent 14 years
(Cl. D48—24)



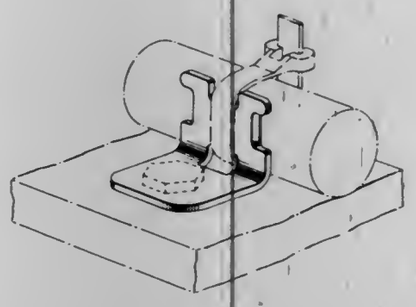
205,788
BICYCLE LIGHT
Viktor Schreckengost, 2265 Stillman Road, Cleveland Heights 18, Ohio
Original design application June 15, 1964, Ser. No. 80,397, now Patent No. 203,064, dated Nov. 3, 1965. Divided and this application Aug. 6, 1965, Ser. No. 87,046
Term of patent 14 years
(Cl. D48—24)



205,789
TOWEL DISPENSING CABINET
Le Roy F. Radtke, Jr., Chicago, Ill., assignor to Steiner American Corporation, Chicago, Ill., a corporation of Nevada
Filed May 3, 1965, Ser. No. 85,057
Term of patent 14 years
(Cl. D52—2)

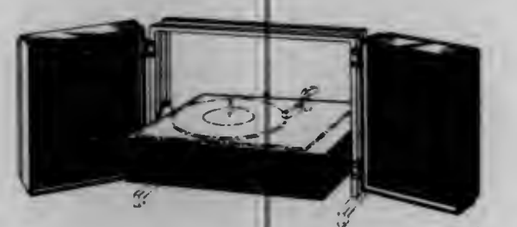


205,790
BOTTLE VENDING MACHINE OR SIMILAR ARTICLE
James R. Reichow, Edina, Minn., assignor to The Cornelius Company, Anoka, Minn., a corporation of Minnesota
Filed Mar. 14, 1966, Ser. No. 1,442
Term of patent 14 years
(Cl. D52—3)



205,791
INSTRUMENT FACE FOR GYROSCOPIC INSTRUMENTS
David E. Harding, 5128 Aldrich Ave. S., Minneapolis, Minn.
Filed Oct. 14, 1964, Ser. No. 82,168
Term of patent 14 years
(Cl. D52—6)

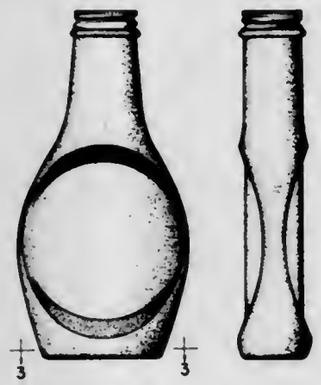
205,792
VERNIER SURFACE THERMOMETER OR THE LIKE
George A. Argabrite, Malibu, Calif. (2301 Federal Ave., Los Angeles, Calif. 90064)
Filed May 3, 1965, Ser. No. 85,069
Term of patent 14 years
(Cl. D52—7)



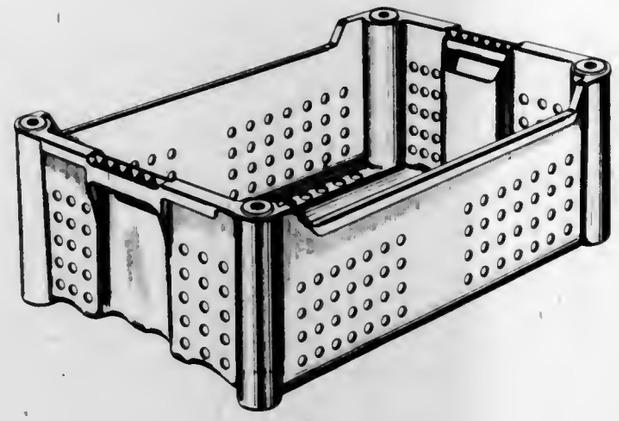
205,793
MOUNTING BRACKET
Harry J. Holmes, Basking Ridge, N.J., assignor to The Thomas & Betts Co., Elizabeth, N.J., a corporation of New Jersey
Filed July 1, 1965, Ser. No. 85,974
Term of patent 14 years
(Cl. D54—1)

205,794
DECORATIVE SCROLL
Garland L. Sheldall, Los Angeles County, Calif. (9063 Nagle Ave., Panorama City, Calif.)
Filed Nov. 10, 1965, Ser. No. 88,058
Term of patent 14 years
(Cl. D54—2)

205,795
PORTABLE PHONOGRAPH OR SIMILAR ARTICLE
Bernard A. Grae and Richard S. Cox, Indianapolis, Ind., assignors to Radio Corporation of America, a corporation of Delaware
Filed May 28, 1965, Ser. No. 85,511
Term of patent 14 years
(Cl. D56—4)



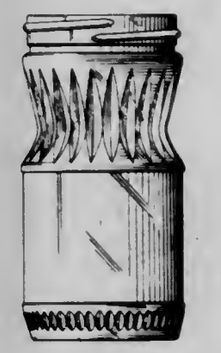
205,796
SPECTACLE FRONT
Gerald Courtney, 6311 Yucca St., Hollywood, Calif.
Filed Nov. 19, 1965, Ser. No. 391
Term of patent 14 years
(Cl. D57—1)



205,797
BOTTLE
William L. Lee, Phoenix, Md., and James A. Shepler, Toledo, Ohio, assignors to Owens-Illinois, Inc., a corporation of Ohio
Filed Sept. 22, 1965, Ser. No. 87,106
Term of patent 14 years
(Cl. D58—6)

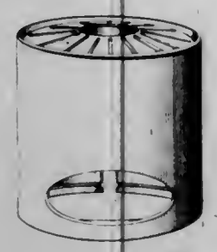
205,798
BOTTLE
John Le Roy Parcels, Bordentown, N.J.
Filed Nov. 19, 1965, Ser. No. 88,157
Term of patent 14 years
(Cl. D58—6)

205,799
STACKING BOX OR THE LIKE
Roy C. Josephsen, 230 Oak Ridge Road, Hillsdale, N.J., and Clifford L. Weir, 62 Rolling Hills Drive, Wayne, N.J.
Filed Oct. 11, 1965, Ser. No. 87,418
Term of patent 14 years
(Cl. D58—12.6)

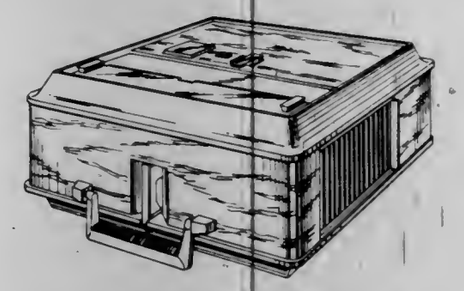


205,800
HINGED COMPARTMENTED CONTAINER
John Donald Bostrom, Niles, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill., a corporation of Delaware
Filed Mar. 15, 1965, Ser. No. 84,261
Term of patent 14 years
(Cl. D58—13)

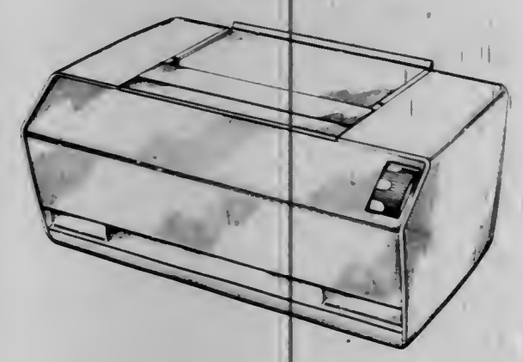
205,801
COMBINED WASTE RECEPTACLE AND TRAY
Mario Manfredonia, Nassau County, N.Y. (2 Emerald Drive, Glen Cove, N.Y.)
Filed Aug. 7, 1964, Ser. No. 81,194
Term of patent 14 years
(Cl. D58—17)



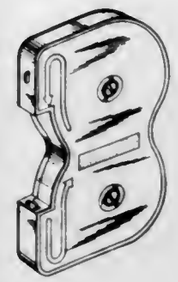
205,802
JAR OR SIMILAR ARTICLE
Floyd E. Pettengill, Lancaster, Ohio, assignor to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware
Filed May 18, 1964, Ser. No. 80,008
Term of patent 14 years
(Cl. D58—25)



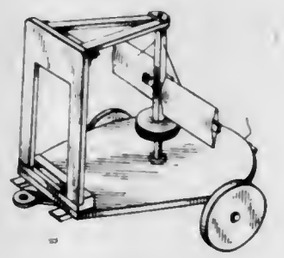
205,803
PULL TAB FOR A TEAR STRIP OPENER
Ralph C. Van Kuren, Coopersburg, and Louis S. Schwartz, Schnecksville, Pa., and Raymond O. Palmgren, Glenview, Ill., assignors to Bethlehem Steel Corporation
Filed Aug. 18, 1965, Ser. No. 86,620
Term of patent 14 years
(Cl. D58—26)



205,804
COVER FOR AN AEROSOL DISPENSER
Robert L. Weber III, New Canaan, Conn., assignor to Time-Mist Inc., Stamford, Conn., a corporation of Delaware
Filed Sept. 30, 1965, Ser. No. 87,249
Term of patent 14 years
(Cl. D58—26)

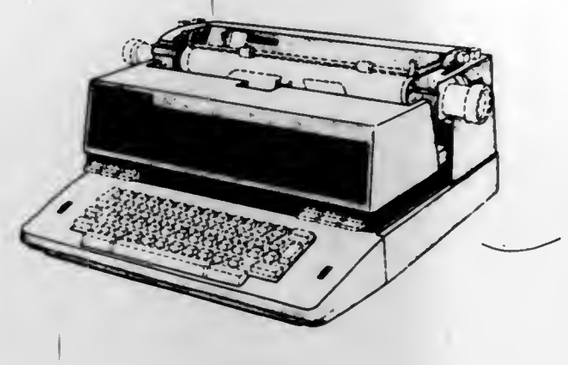


205,805
SLIDE PROJECTOR
Robert M. Simonelli, Des Plaines, and Thomas M. Steinbach, Park Ridge, Ill., assignors to Sawyer's Inc., Portland, Oreg., a corporation of Oregon
Filed Sept. 10, 1965, Ser. No. 86,948
Term of patent 14 years
(Cl. D61—1)



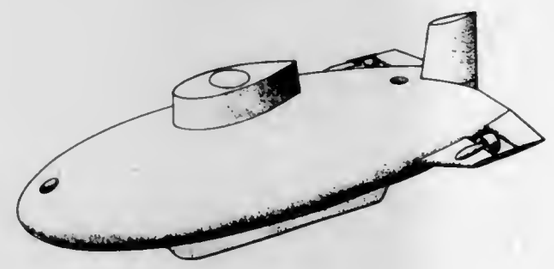
205,806
REPRODUCTION MACHINE
Robert G. Plantholt, Rochester, Mich., assignor to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Sept. 30, 1965, Ser. No. 87,243
Term of patent 14 years
(Cl. D61—1)

205,807
FILM CARTRIDGE OR SIMILAR ARTICLE
Hiroshi Yamamura, 809 4-chome, Midori, Odawara-shi, Japan
Filed Oct. 5, 1965, Ser. No. 87,325
Claims priority, application Japan Apr. 5, 1965
Term of patent 14 years
(Cl. D61—1)

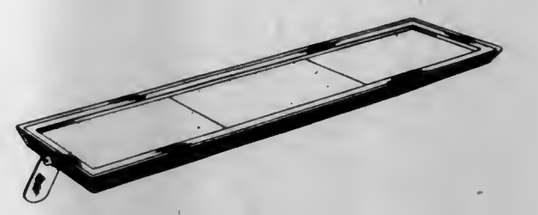


205,808
MOBILE FAN
Hans Skreberg, Big Bend, Minn. (Milan, Minn. 56262)
Filed Apr. 18, 1966, Ser. No. 1,922
Term of patent 14 years
(Cl. D62—4)

205,809
ADDING MACHINE OR SIMILAR ARTICLE
Pierre L. Crease, Kettering, and Donald M. Streiff, Dayton, Ohio, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Filed Dec. 15, 1965, Ser. No. 180
Term of patent 14 years
(Cl. D64—11)

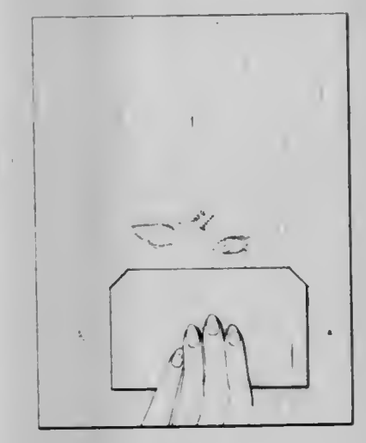


205,810
TYPEWRITER
Carl L. Otto, 9 E. 68th St., New York, N.Y.
Filed Feb. 23, 1966, Ser. No. 1,149
Term of patent 14 years
(Cl. D64—11)

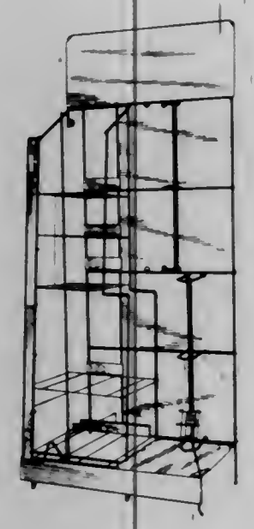


205,811
TYPEWRITER
George H. Kress, 60 S. Munn St., East Orange, N.J., and Alexander Sarkis, Jr., 415A Clinton Ave., Brooklyn, N.Y.
Filed Mar. 25, 1966, Ser. No. 1,630
Term of patent 14 years
(Cl. D64—11)

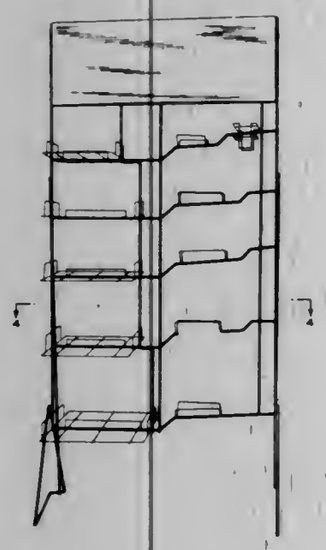
205,812
DEEP SUBMERGENCE RESEARCH SUBMARINE
Herman G. Ulbrich, Los Altos, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Dec. 20, 1965, Ser. No. 238
Term of patent 14 years
(Cl. D71—1)



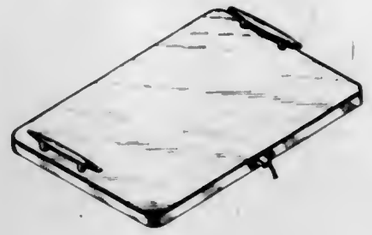
205,813
BEACH BARGE
Robert B. Ward, Box 4574, Fresno, Calif.
Filed July 26, 1965, Ser. No. 86,289
Term of patent 14 years
(Cl. D71—1)



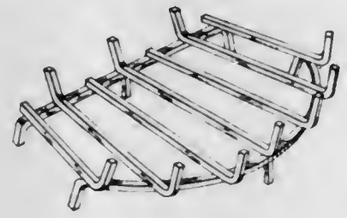
205,814
JET AIRPLANE OR THE LIKE
Mike Tecton, 5101 45th St. NW., Washington, D.C.
Filed Oct. 24, 1965, Ser. No. 87,910
Term of patent 14 years
(Cl. D71—1)



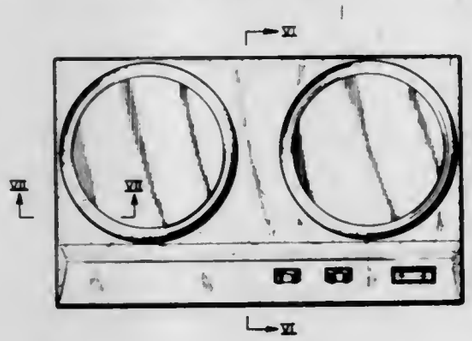
205,815
DISPLAY CARD FOR PACKAGED MERCHANDISE
William Albert Binstead, 106 Old Farm Road S., New Hyde Park, N.Y.
Filed Nov. 8, 1965, Ser. No. 88,041
Term of patent 14 years
(Cl. D80—5)



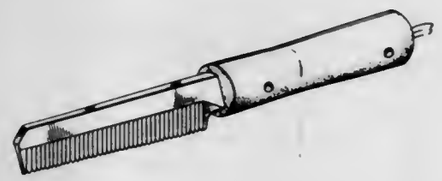
205,816
DISPLAY RACK
Bernard Kleinman, New York, N.Y., assignor to Fedtro, Inc., Rockville Centre, Long Island, N.Y.
Filed Nov. 8, 1965, Ser. No. 88,021
Term of patent 14 years
(Cl. D80—10)



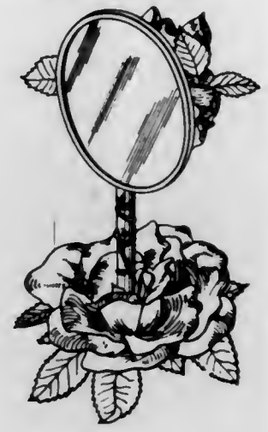
205,817
DISPLAY RACK
Bernard Kleinman, New York, N.Y., assignor to Fedtro, Inc., Rockville Centre, N.Y.
Filed Nov. 8, 1965, Ser. No. 88,022
Term of patent 14 years
(Cl. D80—10)



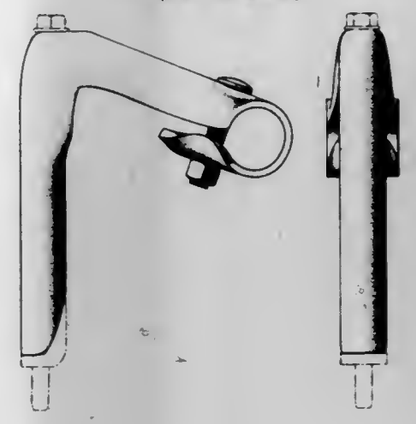
205,818
RADIANT HEATER SUSPENSION PANEL FOR THE MODESTY PANEL OF A DESK
Louis J. Reynolds, Santa Fe, N. Mex., assignor to Aztec Electric Heat (a division of Reynolds Electrical & Engineering Co., Inc.), Santa Fe, N. Mex.
Filed Dec. 14, 1964, Ser. No. 83,307
Term of patent 14 years
(Cl. D81—1)



205,819
FIREPLACE GRATE OR THE LIKE
Edward Foreman, 11018 Acalanes Drive, and De Moody Blair, 303 Darr St., both of Oakland, Calif. 94603
Filed Sept. 23, 1965, Ser. No. 87,127
Term of patent 14 years
(Cl. D81—5)



205,820
WARMING TRAY OR THE LIKE
Thomas J. Ryan, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Jan. 21, 1965, Ser. No. 83,518
Term of patent 14 years
(Cl. D81—10)



205,821
ELECTRICALLY HEATED COMB
Harold G. Lattimer, Long Beach, Calif., assignor to Owen Franks of California, Inc., North Hollywood, Calif., a corporation of California
Filed Jan. 13, 1966, Ser. No. 591
Term of patent 14 years
(Cl. D86—8)

205,822
FLORAL MIRROR STAND
Leo Lederman, New York, N.Y., assignor to L. Thaler & Co., Inc., New York, N.Y., a corporation of New York
Filed Aug. 12, 1964, Ser. No. 81,250
Term of patent 14 years
(Cl. D86—10)

205,823
BICYCLE STEERING POST
Ruben L. Pawsat, Maysville, Ky., assignor to Wald Manufacturing Company, Incorporated, Maysville, Ky., a corporation of Kentucky
Filed Dec. 30, 1965, Ser. No. 382
Term of patent 14 years
(Cl. D90—9)

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 20TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Antalek, John J. Thompson Ramo Wooldridge Inc. Coupling device. Re. 26,089, 9–20–66, Cl. 317—101.

Baker Oil Tools, Inc.: *See*—
Myers, William D. Re. 26,085.

Bell Telephone Laboratories, Inc.: *See*—
White, Donald L. Re. 26,091.

Bendix Corp., The: *See*—
Tankersley, James A., and Driscoll. Re. 26,078.

Cooper, Martin, to Motorola, Inc. Selective calling apparatus. Re. 26,079, 9–20–66, Cl. 340—164.

Dixon Corp.: *See*—
Rulon-Miller, Robert, and Ricklin. Re. 26,088.

Driscoll, Paul A.: *See*—
Tankersley, James A., and Driscoll. Re. 26,078.

Dunwell, Stephen W., C. E. Stephens, W. R. Stringfellow, and V. D. Winkler, to International Business Machines Corp. Multi-computer system including multiplexed memories, lookahead, and address interleaving features. Re. 26,087, 9–20–66, Cl. 340—172.5.

Dyke, Walter P., and F. J. Grundhauser, to Field Emission Corp. Short pulse-high energy field emission type electron radiation tube. Re. 26,081, 9–20–66, Cl. 250—49.5.

Field Emission Corp.: *See*—
Dyke, Walter P., and Grundhauser. Re. 26,081.

Forrer, Homer W., to The Mead Corp. Article carrier. Re. 26,083, 9–20–66, Cl. 220—115.

Grundhauser, Frank J.: *See*—
Dyke, Walter P., and Grundhauser. Re. 26,081.

Hagstrom, Arthur A., to Teletype Corp. Telegraph transmitter distributor starting mechanism. Re. 26,080, 9–20–66, Cl. 178—17.

Inoue, Kiyoshi. Electric power supply apparatus for electric method of electrical discharge machining. Re. 26,090, 9–20–66, Cl. 219—69.

International Business Machines Corp.: *See*—
Dunwell, Stephen W., Stephens, Stringfellow, and Winkler. Re. 26,087.

McKenzie, Archibald M., to Sherman Development Ltd. Self-cleaning ash tray. Re. 26,092, 9–20–66, Cl. 220—20.5.

Mead Corp., The: *See*—
Forrer, Homer W. Re. 26,083.

Motorola, Inc.: *See*—
Cooper, Martin. Re. 26,079.

Myers, William D., to Baker Oil Tools, Inc. Hydraulically actuated well packers. Re. 26,085, 9–20–66, Cl. 166—120.

Osborne, George T., to Sperry Rand Corp. Asynchronous binary counter register stage with flip-flop and gate utilizing plurality of interconnected (NOR) logic circuits. Re. 26,082, 9–20–66, Cl. 307—88.5.

Popovitsch, Ernst: *See*—
Ruhrmann, Josef, Streicher, and Popovitsch. Re. 26,086.

Ranson, Charles W. Fruit and vegetable washing device with vertical circulative flow and ribbed cover. Re. 26,084, 9–20–66, Cl. 259—4.

Ricklin, Saul: *See*—
Rulon-Miller, Robert, and Ricklin. Re. 26,088.

Ruhrmann, Josef, K. Streicher, and E. Popovitsch, to Talon, Inc. Slide fasteners. Re. 26,086, 9–20–66, Cl. 24—205.1.

Rulon-Miller, Robert, and S. Ricklin, to Dixon Corp. Bearing composition. Re. 26,088, 9–20–66, Cl. 252—12.

Sherman Development Ltd.: *See*—
McKenzie, Archibald M. Re. 26,092.

Sperry Rand Corp.: *See*—
Osborne, George T. Re. 26,082.

Stephens, Clarence E.: *See*—
Dunwell, Stephen W., Stephens, Stringfellow, and Winkler. Re. 26,087.

Streicher, Kurt: *See*—
Ruhrmann, Josef, Streicher, and Popovitsch. Re. 26,086.

Stringfellow, William R.: *See*—
Dunwell, Stephen W., Stephens, Stringfellow, and Winkler. Re. 26,087.

Talon, Inc.: *See*—
Ruhrmann, Josef, Streicher, and Popovitsch. Re. 26,086.

Tankersley, James A., and P. A. Driscoll; said Tankersley assor. to The Bendix Corp. Combination adjuster and reset mechanism. Re. 26,078, 9–20–66, Cl. 188—72.

Teletype Corp.: *See*—
Hagstrom, Arthur A. Re. 26,080.

Thompson Ramo Wooldridge Inc.: *See*—
Antalek, John J. Re. 26,089.

White, Donald L., to Bell Telephone Laboratories, Inc. Ultrasonic amplifiers, oscillators, circulators, isolators and switches. Re. 26,091, 9–20–66, Cl. 331—96.

Winkler, Vaughn D.: *See*—
Dunwell, Stephen W., Stephens, Stringfellow, and Winkler. Re. 26,087.

LIST OF DESIGN PATENTEES

Albanese, Arthur, to Marvel Jewelry Mfg. Co. Pendant cross or the like. 205,783, 9–20–66, Cl. D45—16.

Anchor Hocking Glass Corp.: *See*—
Pettengill, Floyd E. 205,802.

Argabrite, George A. Vernier surface thermometer or the like. 205,792, 9–20–66, Cl. D52—7.

Aztec Electric Heat (a division of Reynolds Electrical & Engineering Co., Inc.): *See*—
Reynolds, Louis J. 205,818.

Beckwith-Arden Inc.: *See*—
Beckwith, Edwin L. 205,769.

Beckwith, Edwin L., to Beckwith-Arden Inc. Bayonet scabbard. 205,769, 9–20–66, Cl. D22—6.

Bethlehem Steel Corp.: *See*—
Van Kuren, Ralph C., Schwartz, and Palmgren. 205,803.

Binstead, William A. Display card for packaged merchandise. 205,815, 9–20–66, Cl. D80—5.

Bjorgensen, S. A.: *See*—
Martignoli, Louis. 205,766.

Blair, Benton. Bird feeder. 205,772, 9–20–66, Cl. D31—2.

Blair, De Moody: *See*—
Foreman, Edward, and Blair. 205,819.

Bostrom, John D., to Illinois Tool Works Inc. Hinged compartmented container. 205,800, 9–20–66, Cl. D58—13.

Boubel, William F. Game board. 205,776, 9–20–66, Cl. D34—5.

Bridger, Edward C., to Marriott-Hot Shoppes, Inc. Building. 205,761, 9–20–66, Cl. D13—1.

Brisendine, Roy W. Amphibious car. 205,764, 9–20–66, Cl. D14—3.

California Car Wash Systems Inc.: *See*—
La Mers, Herbert, and Wayne. 205,759.

Coe, Thomas D., to Wakefield Engineering Co., Inc. Heat sink. 205,770, 9–20–66, Cl. D26—1.

Contour Chair-Lounge Co., Inc.: *See*—
Ferro, Arthur C. 205,767.

Cooper, George D. Housing for an indoor light fixture or the like. 205,786, 9–20–66, Cl. D48—20.

Cornelius Co., The: *See*—
Cornelius, Richard T. 205,750.

Cornelius, Richard T., to The Cornelius Co. Beverage dispensing tank, or similar article. 205,750, 9–20–66, Cl. D2—3.

Cornelius Co., The: *See*—
Reichow, James R. 205,790.

Corning Glass Works: *See*—
Ryan, Thomas J. 205,820.

Courtesy Products Corp.: *See*—
Valle, Howard C., Hatchett, and Gust. 205,781.

Courtney, Gerald. Spectacle front. 205,796, 9–20–66, Cl. D57—1.

Cox, Richard S.: *See*—
Grae, Bernard A., and Cox. 205,795.

Crease, Pierre L., and D. M. Streiff, to The National Cash Register Co. Adding machine or similar article. 205,809, 9–20–66, Cl. D64—11.

Cronheim, Richard B. High intensity lamp. 205,785, 9–20–66, Cl. D48—20.

Dominion Electric Corp.: *See*—
Hall, Richard B. 205,754.

Fedtro, Inc.: *See*—
Ota, Hajime. 205,765.
Kleinman, Bernard. 205,816.
Kleinman, Bernard. 205,817.

Ferro, Arthur C., to Contour Chair-Lounge Co., Inc. Chair. 205,767, 9–20–66, Cl. D15—11.

Fink, Robert W., to Whirlpool Corp. Combination countertop and sink. 205,753, 9–20–66, Cl. D4—2.

Foreman, Edward, and D. M. Blair. Fireplace grate or the like. 205,819, 9–20–66, Cl. D81—5.

Franks, Owen, of California, Inc.: *See*—
Lattimer, Harold G. 205,821.

Gerber, Robert E., to Huber-Warco Co. Vehicle. 205,762, 9–20–66, Cl. D14—3.

Gingher, Carl E. Suspension hook for a clothes hanger rod. 205,775, 9–20–66, Cl. D33—8.

Grae, Bernard A., and R. S. Cox, to Radio Corp. of America. Portable phonograph or similar article. 205,795, 9–20–66, Cl. D56—4.

Greenberg, Mal, to Meco, Inc. Rubber glove. 205,751, 9–20–66, Cl. D3—11.

Gust, Raymond E.: *See*—
Valle, Howard C., Hatchett, and Gust. 205,781.
Hakim, Albert S. Poker chip. 205,779, 9–20–66, Cl. D34—5.
Hall, Richard B., to Dominion Electric Corp. Combined holder and charging unit for electric toothbrush or the like. 205,754, 9–20–66, Cl. D4—3.
Harding, David E. Instrument face for gyroscopic instruments. 205,791, 9–20–66, Cl. D52—6.
Hatchett, Samuel E.: *See*—
Valle, Howard C., Hatchett, and Gust. 205,781.
Hazelquist, John L., to Traub Mfg. Co. Finger ring. 205,782, 9–20–66, Cl. D45—10.
Hocutt, R. Hovan, and T. E. Mullinax, to Pneumafil Corp. Combination air filtering and collecting unit for textile waste products. 205,760, 9–20–66, Cl. D9—2.
Holmes, Harry J., to The Thomas & Betts Co. Mounting bracket. 205,793, 9–20–66, Cl. D54—1.
Huber-Warco Co.: *See*—
Gerber, Robert E. 205,762.
Illinois Tool Works Inc.: *See*—
Bostrom, John D. 205,800.
Imperial Cap Works, Inc.: *See*—
Malk, Marvin I. 205,752.
Ischinger, Alfred E. Combined amusement and game device. 205,777, 9–20–66, Cl. D34—5.
Ischinger, Alfred E. Game device. 205,778, 9–20–66, Cl. D34—5.
Josephsen, Roy C., and C. L. Weir. Stacking box or the like. 205,799, 9–20–66, Cl. D58—12.6.
Kleinman, Bernard, to Fedtro, Inc. Display rack. 205,816, 9–20–66, Cl. D80—10.
Kleinman, Bernard, to Fedtro, Inc. Display rack. 205,817, 9–20–66, Cl. D80—10.
Kress, George H., and A. Sarkis, Jr. Typewriter. 205,811, 9–20–66, Cl. D64—11.
La Mers, Herbert, and M. W. Wayne, to California Car Wash Systems Inc. Vacuum cleaner. 205,759, 9–20–66, Cl. D9—2.
Lattimer, Harold G., to Owen Franks of California, Inc. Electrically heated comb. 205,821, 9–20–66, Cl. D86—8.
Lederman, Leo, to L. Thaler & Co., Inc. Floral mirror stand. 205,822, 9–20–66, Cl. D86—10.
Lee, William L., and J. A. Shepler, to Owens-Illinois, Inc. Bottle. 205,797, 9–20–66, Cl. D58—6.
Lockheed Aircraft Corp.: *See*—
Ulbrich, Herman G. 205,812.
Malk, Marvin I., to Imperial Cap Works, Inc. Hat. 205,752, 9–20–66, Cl. D3—13.
Manfredonia, Mario. Combined waste receptacle and tray. 205,801, 9–20–66, Cl. D58—17.
Marriott-Hot Shoppes, Inc.: *See*—
Bridger, Edward C. 205,761.
Martens, H. Henry, to The Stanley Works. Drapery traverse rod. 205,768, 9–20–66, Cl. D21—1.
Martignoli, Louis, to S. A. Biorgensen. Restaurant booth seat or similar article. 205,766, 9–20–66, Cl. D15—11.
Marvel Jewelry Mfg. Co.: *See*—
Albanese, Arthur. 205,783.
Meco, Inc.: *See*—
Greenberg, Mal. 205,751.
Mullinax, Thomas E.: *See*—
Hocutt, R. Hovan, and Mullinax. 205,760.
National Cash Register Co., The: *See*—
Crease, Pierre L., and Streiff. 205,809.
Orbitor, Ltd.: *See*—
Storm, Frederick K., Jr. 205,758.
Ota, Hajime, to Fedtro, Inc. Auto defroster. 205,765, 9–20–66, Cl. D14—6.
Otto, Carl L. Typewriter. 205,810, 9–20–66, Cl. D64—11.
Owens-Illinois, Inc.: *See*—
Lee, William L., and Shepler. 205,797.
Palmgren, Raymond O.: *See*—
Van Kuren, Ralph C., Schwartz, and Palmgren. 205,803.
Parcels, John L. R. Bottle. 205,798, 9–20–66, Cl. D58—6.
Pawsat, Ruben L., to Wald Mfg. Co., Inc. Bicycle steering post. 205,823, 9–20–66, Cl. D90—9.
Pettengill, Floyd E., to Anchor Hocking Glass Corp. Jar or similar article. 205,802, 9–20–66, Cl. D58—25.
Plantholt, Robert G., to Xerox Corp. Reproduction machine. 205,806, 9–20–66, Cl. D61—1.
Pneumafil Corp.: *See*—
Hocutt, R. Hovan, and Mullinax. 205,760.
Post, Bernard E. Golf cart. 205,763, 9–20–66, Cl. D14—3.
Radio Corp. of America: *See*—
Grae, Bernard A., and Cox. 205,795.
Radtke, Le Roy F., Jr., to Steiner American Corp. Towel dispensing cabinet. 205,789, 9–20–66, Cl. D52—2.
Reichow, James R., to The Cornelius Co. Bottle vending machine or similar article. 205,790, 9–20–66, Cl. D52—3.
Reynolds, Louis J., to Aztec Electric Heat (a division of Reynolds Electrical & Engineering Co., Inc.). Radiant heater suspension panel for the modesty panel of a desk. 205,818, 9–20–66, Cl. D81—1.
Ryan, Thomas J., to Corning Glass Works. Warming tray or the like. 205,820, 9–20–66, Cl. D81—10.
Sarkis, Alexander, Jr.: *See*—
Kress, George H., and Sarkis. 205,811.
Sawyer's Inc.: *See*—
Simonelli, Robert M., and Steinbach. 205,805.
Schneider, Joseph L. Fish lure. 205,773, 9–20–66, Cl. D31—4.
Schneider, Joseph L. Fish lure. 205,774, 9–20–66, Cl. D31—4.
Schreckengost, Viktor. Bicycle light. 205,787, 9–20–66, Cl. D48—24.
Schreckengost, Viktor. Bicycle light. 205,788, 9–20–66, Cl. D48—24.
Schwartz, Louis S.: *See*—
Van Kuren, Ralph C., Schwartz, and Palmgren. 205,803.
Schwartz, Nathan R., to Swiveller Co., Inc. Lighting fixture adaptor. 205,784, 9–20–66, Cl. D48—4.
Servus Rubber Co., The: *See*—
Wakeland, William V. 205,757.
Sheldall, Garland L. Decorative scroll. 205,794, 9–20–66, D54—2.
Shepler, James A.: *See*—
Lee, William L., and Shepler. 205,797.
Simonelli, Robert M., and T. M. Steinbach, to Sawyer's Inc. Slide projector. 205,805, 9–20–66, Cl. 61—1.
Skreberg, Hans. Mobile fan. 205,808, 9–20–66, Cl. D62—4.
Slade, Duncan E., to United States Rubber Co. Overshoe. 205,755, 9–20–66, Cl. D7—4.
Spiselman, Leonard. Picture frame. 205,771, 9–20–66, Cl. D29—20.
Stanley Works, The: *See*—
Martens, H. Henry. 205,768.
Steinbach, Thomas M.: *See*—
Simonelli, Robert M., and Steinbach. 205,805.
Steiner American Corp.: *See*—
Radtke, Le Roy F., Jr. 205,789.
Storm, Frederick K., Jr., to Orbitor, Ltd. Floor treating machine. 205,758, 9–20–66, Cl. D9—2.
Streiff, Donald M.: *See*—
Crease, Pierre L., and Streiff. 205,809.
Swiveller Co., Inc.: *See*—
Schwartz, Nathan R. 205,784.
Tecton, Mike. Jet airplane, or the like. 205,814, 9–20–66, Cl. D71—1.
Texas Industries Inc.: *See*—
Van der Lely, Cornelis. 205,780.
Thaler, L., & Co., Inc.: *See*—
Lederman, Leo. 205,822.
Thomas & Betts Co., The: *See*—
Holmes, Harry J. 205,793.
Time-Mist Inc.: *See*—
Weber, Robert L., III. 205,804.
Traub Mfg. Co.: *See*—
Hazelquist, John L. 205,782.
Triplett, Fanny, to Tripples. Bath sponge. 205,756, 9–20–66, Cl. D9—2.
Tripples: *See*—
Triplett, Fanny. 205,756.
Ulbrich, Herman G., to Lockheed Aircraft Corp. Deep submergence research submarine. 205,812, 9–20–66, Cl. D71—1.
United States Rubber Co.: *See*—
Slade, Duncan E. 205,755.
Valle, Howard C., S. E. Hatchett, and R. E. Gust, to Courtesy Products Corp. Beverage server or the like. 205,781. 9–20–66, Cl. D44—21.
Van der Lely, Cornelis, to Texas Industries Inc. Harvesting machine. 205,780, 9–20–66, Cl. D40—1.
Van Kuren, Ralph C., L. S. Schwartz, and R. O. Palmgren, to Bethlehem Steel Corp. Pull tab for a tear strip opener. 205,803, 9–20–66, Cl. D58—26.
Wakefield Engineering Co., Inc.: *See*—
Coe, Thomas D. 205,770.
Wakeland, William V., to The Servus Rubber Co. Footwear sole. 205,757, 9–20–66, Cl. D7—5.
Wald Mfg. Co., Inc.: *See*—
Pawsat, Ruben L. 205,823.
Ward, Robert B. Beach barge. 205,813, 9–20–66, Cl. D71—1.
Wayne, Maury W.: *See*—
La Mers, Herber, and Wayne. 205,759.
Weber, Robert L., III., to Time-Mist Inc. Cover for an aerosol dispenser. 205,804, 9–20–66, Cl. D58—26.
Weir, Clifford L.: *See*—
Josephsen, Roy C., and Weir. 205,799.
Whirlpool Corp.: *See*—
Fink, Robert W. 205,753.
Xerox Corp.: *See*—
Plantholt, Robert G. 205,806.
Yamamura, Hiroshi. Film cartridge or similar article. 205,807, 9–20–66, Cl. D61—1.

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 20TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

ACF Industries, Inc.: *See*—
Balderston, John M., and Burke. 3,274,340.
Gibson, Earl D. 3,274,582.
Johnson, Eldon A. 3,273,870.
A & D Associates: *See*—
Cassini, Genaro. 3,273,174.
AMP Inc.: *See*—
Frant, Martin S., and Elss. 3,274,034.
Swanson, John A. 3,274,572.
Abbott, Frank R., and J. A. Peugh, to United States of America, Navy. Broad band multiple beam forming device. 3,274,536, 9–20–66, Cl. 340—6.
Abbott Laboratories: *See*—
Short, James H. 3,274,218.
Abel, Martin L., to Permawick Co. Extrusion apparatus and method. 3,273,668, 9–20–66, Cl. 184—1.
Acme Tool, Inc.: *See*—
Burner, Donald L. 3,273,932.
Acton Laboratories Inc.: *See*—
Mongeau, Eugene H. 3,274,350.
Adams, Cecelia J.: *See*—
Lester, George R., and Adams. 3,274,273.
Adams, George P., to Western Electric Co., Inc. Apparatus for dispensing washers. 3,273,230, 9–20–66, Cl. 29—211.
Adams, Loyd W., to Phillips Petroleum Co. Filtration. 3,274,103, 9–20–66, Cl. 210—23.
Adolphson, Lynn C.: *See*—
Gilboe, Daniel P., and Adolphson. 3,274,042.
Adriance, Theodore R., Jr., and E. P. Smith, to General Electric Co. Commutator riser construction. 3,274,413, 9–20–66, Cl. 310—234.
Aerovox Corp.: *See*—
Rodriguez, Antonio R., and Stapleton. 3,274,468.
Aftandilian, Victor D., to Cabot Corp. Catalyst composition having increased hydroxyl groups bound thereto and method for producing same. 3,274,120, 9–20–66, Cl. 252—432.
Agfa Aktiengesellschaft: *See*—
Jakob, Franz. 3,273,479.
Kiper, Gerd. 3,273,481.
Menzel, Karl-Heinz, Wahl, and Kuhn. 3,274,001.
Winkler, Alfred, Landbrecht, and Engelsmann. 3,273,480.
Aguilar, Henry. Apparatus for orienting fruit having stems, and for pitting said fruit. 3,273,615, 9–20–66, Cl. 146—19.
Air Balance Inc.: *See*—
McCabe, Francis J. 3,273,632.
Air Reduction Co., Inc.: *See*—
Litvin, Milton, and Muska. 3,273,349.
Rendos, John J., and Banks. 3,273,379.
Swan, Alfred H. 3,273,600.
Ajax Mfg. Co., The: *See*—
Ehlert, William A. 3,273,372.
Aladdin Industries, Inc.: *See*—
Kincaid, William B. 3,274,466.
Albert, Harry E., and P. G. Haines, to Pennsalt Chemicals Corp. Process for tertiary amine oxides and hydroxylamines. 3,274,252, 9–20–66, Cl. 260—583.
Albright, Denton M., and C. Perlaky, to United States Steel Corp. Method for improving the conversion of aromatic carboxylic acids to phenols. 3,274,262, 9–20–66, Cl. 260—621.
Aldrich, Thomas R. Attachment for crutches and like walking aids. 3,273,573, 9–20–66, Cl. 135—62.
Alexander, Thomas E., and W. F. Nelson, to Koehring Co. Automatic fill-up and cementing devices for well pipes. 3,273,650, 9–20–66, Cl. 166—225.
Alfille, Lucien, to European Atomic Energy Community-Euratom. Fuel rods for nuclear reactors. 3,274,069, 9–20–66, Cl. 176—72.
Algeo, Jerry A.: *See*—
Randall, Grant M., and Algeo. 3,274,602.
Allard Instrument Corp.: *See*—
Skrobisch, Alfred. 3,273,270.
Allen, Helen M., and A. J. Austin. Tie-rod bracket for concrete forms. 3,273,848, 9–20–66, Cl. 249—219.
Allen, John D., to Fawick Corp. Hydraulic system. 3,273,467, 9–20–66, Cl. 91—420.
Allen, John D., to Fawick Corp. Hydraulic system with regenerative position. 3,273,468, 9–20–66, Cl. 91—420.
Allen, Kenneth M., and C. H. Harper, to Allen-Harper, Inc. Eccentric pulley drive. 3,273,698, 9–20–66, Cl. 198—220.
Allen, Willard B., to United States of America, Navy. Series-parallel recirculation time compressor. 3,274,341, 9–20–66, Cl. 179—15.55.
Allen-Harper, Inc.: *See*—
Allen, Kenneth M., and Harper. 3,273,698.
Allied Chemical Corp.: *See*—
Anderson, Norman L., and Litke. 3,274,171.
Gilbert, Everett E., and Rumanowski. 3,274,243.
Shrensel, Julius. 3,273,200.
Allied Control Co., Inc.: *See*—
Bayer, Eric W., and Bentz. 3,274,523.
Allis-Chalmers Mfg. Co.: *See*—
Jacobs, Joseph J., and Basco. 3,273,510.
Allison, Ethel. Annular wig suitable for attachment to the natural hair. 3,273,570, 9–20–66, Cl. 132—53.
Alsys, Clarence M., to Tee-Pak, Inc. Shirred sausage casing with end closure. 3,274,005, 9–20–66, Cl. 99—176.
Aluminium Laboratories Ltd.: *See*—
Braunwarth, Victor A., Nickle, and Phillips. 3,274,008.
Lister, Leslie, and Thompson. 3,273,736.
Siviliotti, Olivo G. 3,273,819.
Aluminum Co. of America: *See*—
Davie, James W. 3,273,737.
Foster, Luther M., and Long. 3,274,009.
Rutemiller, Herbert C., and Montgomery. 3,274,085.
Al-Vent Inc.: *See*—
Jordal, Robert L. 3,273,298.
Amagasa, Masataka, and T. Yamaguchi. Process for the production of cyclohexene and methylcyclohexene. 3,274,272, 9–20–66, Cl. 260—666.
Amano, Noboru, and N. Wakayama, to Nihon Genshiryoku Kenkyu Sho. Division circuit. 3,274,381, 9–20–66, Cl. 235—196.
Amara Co. Ltd., The: *See*—
Wilson, Wilfred W. 3,273,804.
Amborski, Leonard E., to E. I. du Pont de Nemours and Co. Method of producing non-fogging films. 3,274,090, 9–20–66, Cl. 204—165.
Amborski, Leonard E., to E. I. du Pont de Nemours and Co. Method of producing non-fogging films. 3,274,091, 9–20–66, Cl. 204—165.
American Brake Shoe Co.: *See*—
Creedle, Fred W., and Mars. 3,273,672.
American Chain & Cable Co., Inc.: *See*—
Sevrence, Warren E. 3,273,417.
American Cryogenics, Inc.: *See*—
Coyne, John P., and Haddeland. 3,274,123.
American Cyanamid Co.: *See*—
Bikales, Norbert M. 3,274,205.
Bobsein, William P., and Mellor. 3,274,245.
Buckler, Sheldon A., and Epstein. 3,274,256.
Cantrall, Edward W., Littell, and Bernstein. 3,274,056.
Fujita, Yoshimasa, and Tsutsui. 3,273,956.
Heller, Milton D., Lenhard, and Bernstein. 3,274,180.
Hoffenberg, David S., and Cosway. 3,274,077.
Miller, Mary L., and Skogman. 3,274,168.
Nyquist, Arthur S. 3,274,026.
Sydor, Walter J. 3,274,115.
Thompson, Harold G., and Bochner. 3,274,184.
Tomcufcik, Andrew S., Angier, Forbes, and Lindh. 3,274,054.
Welcher, Richard P. 3,274,246.
American Enka Corp.: *See*—
Gonsalves, Conrad J. 3,273,330.
American Home Products Corp.: *See*—
Gleason, Fred C., and Byrnes. 3,273,689.
Sallay, Stephen. 3,274,188.
Stribley, Rexford C. 3,273,703.
Zilliken, Frederick W. 3,274,003.
American Machine & Foundry Co.: *See*—
Wallace, Bert H. 3,273,818.
American Metal Products Co.: *See*—
McMahan, Roy F., Jr. 3,273,842.
American Motors Corp.: *See*—
Kleinlein, Elmer W. 3,273,670.
American Optical Co.: *See*—
Siegmund, Walter P. 3,273,445.
American Radiator & Standard Sanitary Corp.: *See*—
Grahl, Darwin R. 3,273,797.
White, Douglas F. 3,273,865.
American Saint Gobain Corp.: *See*—
Bundy, Albert J. 3,273,706.
Amglo Corp.: *See*—
Henninger, George D. 3,274,409.
Amirikian, Arsham. Split-beam prestressing. 3,273,295, 9–20–66, Cl. 52—223.
Amdahl, Gene M.: *See*—
Paul, Gerard T., Dirac, and Amdahl. 3,274,556.
Amsted Industries, Inc.: *See*—
Hausman, Albert F., and Chiplis. 3,273,434.
Amthor, Franklin R., Jr., H. J. Breivogel, E. R. Hoenle, R. E. Kanitz, and J. M. Katzfey, to Hamilton Mfg. Co. Drafting table. 3,273,517, 9–20–66, Cl. 108—2.
Anaconda Wire & Cable Co.: *See*—
Pendleton, Wesley W., and Saums. 3,273,225.
Anagnostou, George N. Planting container. 3,273,284, 9–20–66, Cl. 47—34.
Andersen, John M., to Hansa Bryggeri A/S. Packing machine. 3,273,723, 9–20–66, Cl. 214—1.
Anderson, Carl P.: *See*—
Clark, Clayton H., and Anderson. 3,274,338.
Anderson, Hattie T.: *See*—
Anderson, Martin and H. T. 3,273,175.
Anderson, James H., and M. J. Spruitenburg, to Borg-Warner Corp. Combination shaft and hub assembly for centrifugal compressor. 3,273,920, 9–20–66, Cl. 287—52.

Anderson, Kelvin G., to W. R. Grace & Co. Method and apparatus for wrapping and package produced. 3,273,301, 9–20–66, Cl. 53—32.

Anderson, Kelvin G., and I. F. Churchill, to W. R. Grace & Co. Method of employing electrostatic means in a heat shrinking process. 3,274,302, 9–20–66, Cl. 264—22.

Anderson, Martin and H. T. Self-tucking fitted sheet. 3,273,175, 9–20–66, Cl. 5—334.

Anderson, Norman L., and A. C. Litke, to Allied Chemical Corp. Monoazo dyestuffs containing a benzothiazole nucleus. 3,274,171, 9–20–66, Cl. 260—158.

Anderson, Paul G., 25% to F. A. Parson, 25% to F. H. Wells, and 25% to B. V. Curry. Weather protected chairs. 3,273,937, 9–20–66, Cl. 297—219.

Andrew, Vladimir. Dental crown and method of producing the same. 3,273,242, 9–20–66, Cl. 32—12.

Andrews, Harold D., Jr. Paint can lib. 3,273,746, 9–20–66, Cl. 220—90.

Andrews, John R., III, to Welsh Mfg. Co. Hard hat with reinforcing ribs. 3,273,162, 9–20–66, Cl. 2—3.

Andrews, John R., III, to Welsh Mfg. Co. Accessory attachment to a hard hat. 3,273,163, 9–20–66, Cl. 2—3.

Andrews, Merritt R., and H. A. Hokanson, to United Aircraft Corp. Arc etching. 3,274,036, 9–20–66, Cl. 156—2.

Andrews, Walter J. Tube removal tool. 3,273,231, 9–20–66, Cl. 29—275.

Andrews, William O. Fire fighting equipment. 3,273,651, 9–20–66, Cl. 169—1.

Anetsberger Brothers, Inc.: *See*—
Anetsberger, Richard J. 3,273,488.

Anetsberger, Richard J., to Anetsberger Brothers, Inc. Basket raising mechanism for twin fryers. 3,273,488, 9–20–66, Cl. 99—407.

Angier, Robert B.: *See*—
Tomcufcik, Andrew S., Angier, Forbes, and Lindh. 3,274,054.

Anker-Werke Aktiengesellschaft: *See*—
Priebs, Horst. 3,274,349.

Annes, Townsend. Portable panel punching tools. 3,273,241, 9–20–66, Cl. 30—360.

Annett, John F., to The Metafiltration Co. Ltd. Filters for liquids. 3,273,374, 9–20–66, Cl. 72—340.

Anschutz & Co. G.m.b.H.: *See*—
Ehrich, Hans. 3,273,404.

Aoki, Yonesaku, M. Emoto, and T. Tanaka, to Kabushiki Kaisha Hitachi Seisakusho. Treatment of phosphors. 3,273,806, 9–20–66, Cl. 241—20.

Appleby & Ireland Ltd.: *See*—
Sharp, Douglas C. W. T. 3,273,398.

Applied Power Industries, Inc.: *See*—
Flaugher, Lawrence L. 3,273,384.

Apted, James E., and G. F. N. Oliver, to Oliver Pell Control Ltd. Electric socket connectors. 3,274,533, 9–20–66, Cl. 339—192.

Archer, Alton M., and R. G. Wyatt, to Lockheed Aircraft Corp. Method and apparatus for evaluating antennae. 3,274,597, 9–20–66, Cl. 343—100.

Archer-Daniels-Midland Co.: *See*—
Budde, Walter M. 3,274,220.
Gliboe, Daniel P., and Adolphson. 3,274,042.
Miraldi, Nick L. 3,273,211.
Smiens, Leon D. 3,274,106.

Arend Hildegard: *See*—
Ritter, Friedbert, Rodis, Reuter, and Querengasser. 3,273,965.

Armco Steel Corp.: *See*—
Bishop, Robert, Castor, Walker, and Word. 3,273,915.

Armour Pharmaceutical Co.: *See*—
Bossinger, Charles D. 3,274,060.

Armour, Walter B., and W. C. Kania, to National Starch and Chemical Corp. Rapid setting adhesive compositions. 3,274,048, 9–20–66, Cl. 161—184.

Armrock Products, Inc.: *See*—
Byington, Ralph L. 3,273,218.

Aronson, Philip M., and R. H. Waser, to United States of America, Navy. Static and dynamic calibration vessel for pressure gages. 3,273,376, 9–20–66, Cl. 73—4.

Aronsson, Arent, to Svenska Flaktfabriken, Aktieholaget. Method for conditioning web- or sheet-like material. 3,274,697, 9–27–66, Cl. 34—36.

Arrow-Hart & Hegeman Electric Co., The: *See*—
Daly, Daniel F., and O'Malley. 3,274,353.

Asahi Kasei Kogyo Kabushiki Kaisha: *See*—
Kobayashi, Tadahiro. 3,274,231.

Atlas Chemical Industries, Inc.: *See*—
Markiewitz, Kenneth H. 3,274,253.
McGirr, Robert, and Gay. 3,274,363.
Spillane, Matthew L., and Helmberger. 3,274,318.

Atlas Copco Aktiebolag: *See*—
Rudeke, Bengt G. 3,273,428.
Ytterfors, Sven L., and Jansson. 3,273,658.

Atliers et Chantiers de la Seine Martime, Societe anonyme des: *See*—
Herrenschmidt, Pierre. 3,273,740.

Atomic Energy of Canada Ltd.: *See*—
Janusz, Stanislaw A., and Pawliw. 3,274,071.

Atwood, Clinton P.: *See*—
Chapman, William I., Whitfield, and Atwood. 3,273,903.
Chapman, William I., Whitfield, and Atwood. 3,273,904.
Chapman, William I., Whitfield, and Atwood. 3,273,905.

Auburn Rubber Co., Inc.: *See*—
Hodson, Richard J., and Myers. 3,273,844.

Ault, Cyrus F., and D. Friedman, to Bell Telephone Laboratories, Inc. Information recording circuit. 3,274,610, 9–20–66, Cl. 346—74.

Austin, Avery J.: *See*—
Allen, Helen M., and Austin. 3,273,848.

Avco Corp.: *See*—
Binder, Alfred A., and Linder. 3,274,564.

Avco Corp.: *See*—
Brogan, Thomas R. 3,274,407.
Louis, Jean F. 3,274,408.

BMW Triebwerkbau G.m.b.H.: *See*—
Kollmann, Franz G., and Laussermair. 3,273,419.

Babcock & Wilcox Co., The: *See*—
Rogers, Charles E., Matty, and Ralston. 3,273,961.

Bachle, Walter W.: *See*—
Magida, Nathan H., and Bachle. 3,274,524.

Bächler, Werner G.: *See*—
Nöller, Hans G., and Bächler. 3,273,787.

Badall, Joseph A., to Olin Mathieson Chemical Corp. Plastic box magazine. 3,273,275, 9–20–66, Cl. 42—50.

Baddorf, Paul E., and J. H. Houdry, to Oxy-Catalyst, Inc. Apparatus for improving the purification of exhaust gases from an internal combustion engine. 3,273,971, 9–20–66, Cl. 23—288.

Bader, Horst, to J. C. Eckardt A.G. Dynamic flow meter. 3,273,391, 9–20–66, Cl. 73—228.

Badger, George M. W., to Varian Associates. Pulser for modulated anode tubes. 3,274,515, 9–20–66, Cl. 332—7.

Baerns, Manfred G.: *See*—
Gabor, John D., and Baerns. 3,273,974.

Baevsky, Melvin M., to E. I. du Pont de Nemours and Co. Polyamides stabilized with alkali metal iodides in combination with phenylene diamines or a his phenol. 3,274,150, 9–20–66, Cl. 260—45.9.

Bailey, Frederick E., Jr., to Union Carbide Corp. Polymerization of epoxides. 3,274,129, 9–20–66, Cl. 260—2.

Baizer, Manuel M., to Monsanto Co. Electrolytic reductive coupling process. 3,274,084, 9–20–66, Cl. 204—72.

Bajars, Laimonis, to Petro-Tex Chemical Corp. Process for dehydrogenating. 3,274,285, 9–20–66, Cl. 260—680.

Baker, Robert S. Apparatus for forming concrete articles. 3,274,659, 9–27–66, Cl. 25—2.

Baker, William P., Jr., to E. I. du Pont de Nemours and Co. Block copolymers of vinylidene compounds and perfluorinated non-vinyl monomers. 3,274,295, 9–20–66, Cl. 260—879.

Bakula, Robert G.: *See*—
Balogh, Roy O., and Bakula. 3,273,466.

Balamuth, Lewis: *See*—
Kuris, Arthur, and Balamuth. 3,273,288.

Balderston, John M., and W. G. Burke, Jr., to ACF Industries, Inc. Digital data multiplexing and demultiplexing. 3,274,340 9–20–66, Cl. 179—15.

Ball, Warren. Carburetion system. 3,273,550, 9–20–66, Cl. 123—119.

Balmer, Hansjorg, and R. J. Gasparac, to Nordberg Mfg. Co. Seal for gyratory crushers. 3,273,808, 9–20–66, Cl. 241—215.

Balogh, Roy O., and R. G. Bakula, to McCabe-Powers Body Co. Single boom derrick units. 3,273,466, 9–20–66, Cl. 91—420.

Banks, Robert R.: *See*—
Rendos, John J., and Banks. 3,273,379.

Banner Co., The: *See*—
Fregeolle, Oscar. 3,273,359.

Barber, Harold W.: *See*—
Brazell, Douglas L., Greenfield, and Barber. 3,274,102.

Barcaskey, Frank L. Hair clipper, vacuum aided and cable driven. 3,273,237, 9–20–66, Cl. 30—133.

Barclays Bank Ltd.: *See*—
Edwards, Gordon J., Thompson, and Senkowski. 3,273,673.

Barker Chemical Co.: *See*—
Brzuskiewicz, John, LoPresti, and Ridenour. 3,273,532.

Barker, Michael D., and G. A. Somerfield, to Glaxo Laboratories Ltd. Derivatives of cephalosporin C and their synthesis. 3,274,186, 9–20–66, Cl. 260—243.

Barnard, Charles F. Well tools. 3,273,648, 9–20–66, Cl. 166—175.

Barnes Engineering Co.: *See*—
Schwarz, Frank. 3,273,395.

Barnes & Reinecke, Inc.: *See*—
Landes, Lewis G. 3,274,452.

Baronnie, Roger, to SCM Corp. Paper feed apparatus having stack selecting means. 3,273,883, 9–20–66, Cl. 271—9.

Baruth, Elmore J., and W. C. Oswald, to Bostrom Corp. Method and means for securing seat covers to the base structure of a seat. 3,273,178, 9–20–66, Cl. 5—353.2.

Basco, David R.: *See*—
Jacobs, Joseph J., and Basco. 3,273,510.

Bassett, Joseph A., and M. H. Battles, to Swift & Co. Scuff resistant leather. 3,274,023, 9–20–66, Cl. 117—142.

Bast, Gerhard, to Voigtlander A.G. Slide projector. 3,273,454, 9–20–66, Cl. 88—28.

Batosti, Mario, and A. Belloni, to Edison. Method and apparatus for extrusion of plastic material. 3,274,317, 9–20–66, Cl. 264—95.

Batt, Irving P., to E. I. du Pont de Nemours and Co. Shrinkable regenerated cellulose band incorporated with translucent micaceous flakes. 3,274,013, 9–20–66, Cl. 106—168.

Battles, Malcolm H.: *See*—
Bassett, Joseph A., and Battles. 3,274,023.

Bauder, Carl J., C. G. Hart, and D. R. Cleminshaw, to Cambridge Filter Corp. Air filter having a replaceable cartridge. 3,273,321, 9–20–66, Cl. 55—341.

Bauer Bros., Co.: *See*—
Horstman, Anton J. 3,273,809.

Bauer Bros., Co., The: *See*—
Starrett, James R. 3,273,758.
Wright, James H. 3,273,807.

Bauerlein, Carl C., to The Dole Valve Co. Heating and cooling zone valve by-pass. 3,273,796, 9–20–66, Cl. 236—1.

Baumgartner, Hans U.: *See*—
Sonderegger, Hans C., and Baumgartner. 3,273,293.

Bayer, Eric W., and J. W. Bentz, to Allied Control Co., Inc. Electromagnetic switching relay having a three-piece U-shaped core. 3,274,523, 9–20–66, Cl. 335—121.

Bayer, Otto: *See*—
Oertel, Gunther, Bayer, and Braun. 3,274,130.

Beard, Jack H., to Davy and United Engineering Co. Ltd. Press anvils. 3,273,490, 9–20–66, Cl. 100—229.

Beatty, John W., to General Electric Co. Gas blast circuit breaker of the axial blast-type with magnetic means for rotating an arc terminal. 3,274,365, 9–20–66, Cl. 200—148.

Beaumont, Albert G., to Courtaulds Ltd. Filamentary material. 3,273,771, 9–20–66, Cl. 225—3.

Becht, Carl T.: *See*—
Juilfs, Albert G. and G. C., and Becht. 3,273,777.

Beck, Alan E., to Canadian Patents and Development Ltd. Apparatus for measuring resistance at the end of a long cable. 3,273,396, 9–20–66, Cl. 73—362.

Beck, Earl J., Jr. Self-pressurized deep ocean buoy. 3,273,181, 9–20–66, Cl. 9—8.

Becke, Edward G. Safety exit attachment for combination lock. 3,273,362, 9–20–66, Cl. 70—320.

Becker, Edward J., and R. S. Robison, to E. R. Squibb & Sons, Inc. A-norpregn-3-ene derivatives. 3,274,237, 9–20–66, Cl. 260—488.

Becker, Stephen P., and B. A. Fulton, to Fargo Mfg. Co., Inc. Insulated cable splice. 3,274,330, 9–20–66, Cl. 174—84.

Beckett, Mildred J.: *See*—
Beckett, Reginald W. 3,273,596.

Beckett, Reginald W., deceased, by M. J. Beckett, executrix. Hydraulic pulsation absorber. 3,273,596, 9–20–66, Cl. 138—30.

Becking, Paul E., to Dura Corp. Tape handling device. 3,273,687. 9–20–66, Cl. 197—180.

Beckman Instruments, Inc.: *See*—
Hinrichs, Karl. 3,274,379.

Beckman, Irving C., and A. M. Beerbohm. Self-mailer. 3,273,785, 9–20–66, Cl. 229—69.

Beebler, Vernon D.: *See*—
Waterman, Russell R. 3,273,644.

Beerbohm, Alex M.: *See*—
Beckman, Irving C., and Beerbohm. 3,273,785.

Begle, John H., to Futurmill, Inc. Cutting tool and method. 3,273,722. 9–20–66, Cl. 29—105.

Behles, Franz G. F.: *See*—
Bensinger, Wolf-Dieter, Derndinger, and Behles. 3,273,544.

Behr, Samuel H. Cable fault locator for ungrounded electrical systems including means for applying a square wave to the cable under test. 3,274,489, 9–20–66, Cl. 324—52.

Behrens, Curtis E., to Borg-Warner Corp. Dry-cleaning machine. 3,273,256, 9–20–66, Cl. 34—45.

Belden Mfg. Co.: *See*—
Timmons, Frank E. 3,274,329.

Bell & Howell Co.: *See*—
Smitzer, Louis A. 3,273,566.
Smitzer, Louis A. 3,273,567.
Townsley, Malcolm G. 3,273,565.

Bell, Ronald L., G. S. Kino, and J. K. Mann, to Varian Associates. Crossed field high-frequency electron discharge apparatus. 3,274,431, 9–20–66, Cl. 315—39.3.

Bell Telephone Laboratories, Inc.: *See*—
Ault, Cyrus F., and Friedman. 3,274,610.
Bobeck, Andrew H., and Smith. 3,274,571.
Dale, John C., and Fuss. 3,274,511.
Enbanks, John M. 3,274,396.
Okinaka, Yutaka, and Turner. 3,274,028.

Bell, William W., Jr., and D. E. MacLeod, to Carrier Corp. Mounting means for air conditioning units. 3,273,843, 9–20–66, Cl. 248—208.

Bellem, Edward, to Northern Electric Co. Ltd. Frequency conversion circuit. 3,274,495, 9–20–66, Cl. 325—434.

Belloni, Antonio: *See*—
Batosti, Mario, and Belloni. 3,274,317.

Beloit Corp.: *See*—
Justus, Edgar J. 3,273,492.
Westbrook, Carl M., and Hess. 3,273,387.

Beltomatic Patentverwertungsanstalt: *See*—
Uher, Edmond. 3,273,679.

Beltz, Philip B., to Hewlett-Packard Co. Thermostatic oven controller with auotmatic reset. 3,274,375, 9–20–66, Cl. 219—501.

Belugou, Pierre, to Charbonnages de France. Mining pick. 3,273,940, 9–20–66, Cl. 299—81.

Bender, Lloyd F. Fluid conveying apparatus. 3,273,514, 9–20–66, Cl. 103—236.

Bendix Corp., The: *See*—
Eddy, Robert T. 3,273 465.
Evans, David C., and Horrell. 3,274,376.
Hood, Edwin E. 3,273,680.
Hooten, Basil P., Jr., and Vest. 3,274,496.
Horton, Russell E. 3,274,366.
Hupp, Edward E. 3,273,945.
Wesstrom, Alfred, and Nice. 3,273,880.
Winkler, Albert H. 3,273,871.
Woodward, Stephen G. 3,273,590.

Bendix-Westinghouse Automotive Air Brake Co.: *See*—
Valentine, Harry M. 3,273,582.

Benedik, Fedor. Sequential electrical lighting arrangement. 3,274,441, 9–20–66, Cl. 315—323.

Bengston, Phillip S., to United States of America, Navy. Apparatus to measure the period of an input signal. 3,274,500, 9–20–66, Cl. 328—108.

Bennett, Alan J., to Tinnerman Products, Inc. Fastening devices. 3,273,839, 9–20–66, Cl. 248—73.

Bennett, Harold E.: *See*—
Dietz, Ralph W., and Bennett. 3,273,289.

Bennett, James R.: *See*—
Sharp, Richard S., Neilson, and Bennett. 3,274,558.

Bennett, Melvin R.: *See*—
Thoma,, Roy E., Jr., Bennett, and Ullmann. 3,273,973.

Bensinger, Wolf-Dieter, H.-O. Derndinger, and F. G. F. Behles, to Diamler-Benz Aktiengesellschaft. Rotary piston internal combustion engine. 3,273,544, 9–20–66, Cl. 123—8.

Bentz, Joseph W.: *See*—
Bayerm, Eric W., and Bentz. 3,274,523.

Benzinger, Theodor H. Heat-burst microcalorimeter. 3,273,968, 9–20–66, Cl. 23—253.

Berardinelli, Frank M., to Celanese Corp. of America. Oxymethylene polymers stabilized with amino substituted amides. 3,274,149, 9–20–66, Cl. 260—45.8.

Berdan, David, to Buck Engineering Co., Inc. Cross-bar distribution panel. 3,274,529, 9–20–66, Cl. 339—18.

Beredjick, Nicky, to Standard Oil Co. Method of retarding water surface evaporation. 3,273,957, 9–20–66, Cl. 21—60.5.

Bergerson, Ronald O. Multiscale engineers scale. 3,273,247, 9–20–66, Cl. 33—107.

Bergman, Elliott, to Shell Oil Co. Epoxy trioxanes. 3,274,162. 9–20–66, Cl. 260—78.4.

Bergstein, Frank D., A. B. Kleingers, Jr., and L. Back, to Bergstein Packaging Trust. Method and means for controlling foaming of clay coating composition during application. 3,274,307, 9–20–66, Cl. 264—37.

Bergstein Packaging Trust: *See*—
Bergstein, Frank D., Kleingers, and Back. 3,274,307.

Berman, Marvin A., to Capitol Hardward Mfg. Co., Inc. Bracket construction. 3,273,847, 9–20–66, Cl. 248—243.

Bermann, Leslie H., to Lockheed Aircraft Corp. Strain measuring device. 3,274,528, 9–20–66, Cl. 338—2.

Bernstein, Seymour: *See*—
Cantrall, Edward W., Littell, and Bernstein. 3,274,056.

Berry, Harold F. Football passing toy. 3,273,282, 9–20–66, Cl. 46—241.

Besozzi, Alfio J.: *See*—
Brli William F., and Besozzi. 3,274,255.

Besson, Paul, and G. Luiset, to Societe d'Electro-Chimie d'Electro-Metallurgie et des Acieries Electriques d'UGine. Production of unsymmetrical dimethylhydrazine. 3,274,251. 9–20–66, Cl. 260—583.

Bethell, James R., to The Distillers Co. Ltd. Production of conjugated diolefines. 3,274,283, 9–20–66, Cl. 260—680.

Bethlehem Steel Corp.: *See*—
McClemens, Samuel W. 3,273,190.
Scott, Earl H. 3,273,437.

Bicking, John B.: *See*—
Cragoe, Edward J., Jr., and Bicking. 3,274,191.

Bidard, Rene A., to Compagnie Electro-Mecanique. Electrical windings. 3,274,414, 9–20–66, Cl. 310—268.

Biehl, James A., to Marathon Oil Co. Method and apparatus for controlling carbon crystallization. 3,274,097, 9–20–66, Cl. 208—46.

Big Dutchman, Inc.: *See*—
Rigterink, Preston D., and Haggard. 3,273,759.

Bikales, Norbert M., to American Cyanamid Co. Quaternary ammonium derivatives of N-alkycarbamoylethyl compounds. 3,274,205, 9–20–66, Cl. 260—295.

Billeter, Henry R., and A. B. Nelson, to Sloan Valve Co. Adjustable plumbing fittings. 3,273,919, 9–20–66, Cl. 285—340.

Billings, William E., and R. M. Lasater, to Halliburton Co. Method of initiating foam in drowned wells. 3,273,643, 9–20–66, Cl. 166—45.

Billson, Frederick W., to Saunders Valve Co. Ltd. Sealing of spindles. 3,273,902, 9–20–66, Cl. 277—95.

Binder, Alfred A., and T. J. Linder, to Avco Corp. Data processor. 3,274,564, 9–20–66, Cl. 340—172.5.

Bindler, Jakob: *See*—
Wachsmann, Hubert, Bindler, and Erny. 3,273,954.

Bird, John L. Hydraulically actuated controllable-pitch propeller system for outboard motors and outdrives. 3,273,656, 9–20–66, Cl. 170—160.32.

Bird Machine Co.: *See*—
Koffinke, Richard A. 3,273,789.

Birkenmeyer, Robert D.: *See*—
Magerlein, Barney J., and Birkenmeyer. 3,274,212.

Bishop, Robert, E. E. Castor, M. A. Walker, and W. W. Word, Jr., to Armco Steel Corp. Remotely installed well devices and wellhead assemblies including the same. 3,273,915, 9–20–66, Cl. 285—18.

Black, Clifford J.: *See*—
Faulkner, Joseph A., Black, and Rolfe. 3,274,585.

Black, Davis R., Jr.: *See*—
Pare, Robert L. 3,273,473.

Black, James A.: *See*—
Rosema, Thomas J., and Farwell. 3,273,497.

Blanco, Juan R.: *See*—
Muchow, Clarence F., Blanco, and Disney. 3,274,607.

Blanco, Elias. Knockdown container construction. 3,273,738, 9–20–66, Cl. 217—12.

Blandford, Herbert S., ¼ to M. Casson. Tamperproof identification device. 3,273,268, 9–20–66, Cl. 40—2.2.

Blass Antenna Electronics Corp.: *See*—
Blass, Judd. 3,274,601.

Blass, Judd, to Blass Antenna Electronics Corp. Antenna system with electronic scanning means. 3,274,601, 9–20–66, Cl. 343—754.

Blatt, Leland F. Power clamp. 3,273,878, 9–20–66, Cl. 269—32.

Blazon, Inc.: *See*—
Grudoski, Daniel P. 3,273,887.

Bloch, Godfrey. Process and apparatus for making bulked filament yarns. 3,273,328, 9–20–66, Cl. 57—34.
Bloch, Herman S., to Universal Oil Products Co. Preparation of diphenyl. 3,274,277, 9–20–66, Cl. 260—670.
Block, Charles, and L. J. Mintz. Fire alarm system. 3,274,578, 9–20–66, Cl. 340—220.
Blomquist, Arthur G., L. Larsen, M. C. Neuman, and P. G. Wermager, to United States of America, Navy. Load status indicator. 3,274,348, 9–20–66, Cl. 200—5.
Blomstrom, Dale C., to E. I. du Pont de Nemours and Co. Anti-corrosion and antifreeze compositions containing an alkali metal salt of 2,3-dihydro-1,4-dithiin-5,6-dicarboxylic acid. 3,274,112, 9–20–66, Cl. 252—78.
Bobeck, Andrew H., and J. L. Smith, to Bell Telephone Laboratories, Inc. Magnetic memory circuits. 3,274,571, 9–20–66, Cl. 340—174.
Bobsein, William P., and J. F. Mellor, Jr., to American Cyanamid Co. Recovery of acrylamide from its salt by vaporization with an inert gas. 3,274,245, 9–20–66, Cl. 260—561.
Bochner, Martin B.: *See*—
Thompson, Harold G., and Bochner. 3,274,184.
Boggs, LeRoy R., to Universal Moulded Fiber Glass Corp. Multiple speed transmission. 3,273,414, 9–20–66, Cl. 74—353.
Boise-Cascade Corp.: *See*—
Gourlie, Larry C. 3,273,216.
Boivie, Jean I. R., to Electrolux, Aktiebolaget. Cooling arrangement for motor-fan unit. 3,274,410, 9–20–66, Cl. 310—62.
Boileau, Christopher W., to Thiokol Chemical Corp. Linear explosive-type igniter train for rocket motor. 3,273,337, 9–20–66, Cl. 60—35.6.
Bolton, Norman A., to The General Signal Corp. Traffic signal controller. 3,274,547, 9–20–66, Cl. 340—37.
Bonadio, George A. Antenna system. 3,274,606, 9–20–66, Cl. 343—854.
Bonang, Raymond P. Maternity girdle. 3,273,563, 9–20–66, Cl. 128—579.
Bonazoli, Robert P.: *See*—
Scoledge, Robert F., and Bonazoli. 3,274,426.
Book Covers, Inc.: *See*—
Mullen, Edward K., and Carter. 3,273,913.
Boone, Edgar. Carton seal. 3,273,783, 9–20–66, Cl. 229—47.
Boone, Stephen E., to United States of America, Navy. Vibrapen scriber assembly. 3,274,609, 9–20–66, Cl. 346—62.
Boothe, Willis A., to General Electric Co. Self-controlling gas generator. 3,273,558, 9–20–66, Cl. 126—271.
Boothroyd, Harold W., and H. Phillips, to United Shoe Machinery Corp. Apparatus for applying adhesive. 3,273,531, 9–20–66, Cl. 118—202.
Boots Pure Drug Co. Ltd.: *See*—
Richards, Hugh C., Spooner, and Housley. 3,274,175.
Borch, Niels R., and R. S. Juntz, to United States of America, Atomic Energy Commission. Vacuum furnace window. 3,273,557, 9–20–66, Cl. 126—200.
Borg-Warner Corp.: *See*—
Anderson, James H., and Spruitenburg. 3,273,920.
Behrens, Curtis E. 3,273,256.

Frits, Henry E., to Union Carbide Corp. Synthesis of 3-substituted alkanoic acid compounds. 3,274,240, 9–20–66, Cl. 260—515.

Fritsch, Christian H. Y., and M. J. C. Lefort, to Rhone-Poulenc S.A. Silicon-containing isoxazoles and isoxasolines. 3,274,210, 9–20–66, Cl. 260—307.

Frost, Barry L., to Clark Equipment Co. Transmission. 3,273,415, 9–20–66, Cl. 74—360.

Frost, John W. Valved, pressurized, fluid-dispensing receptacle with receptacle-attached fitting. 3,273,610, 9–20–66, Cl. 141—353.

Fuentes, Gabriel, Jr. Poultry spur protector. 3,273,540, 9–20–66, Cl. 119—144.

Fujimura, Hajime: *See*—
Senda, Shigeo, Fujimura, and Isumi. 3,274,195.

Fujita, Heroshi, to Daikin Kogyo Co., Ltd. Centralized lubricating system. 3,273,669, 9–20–66, Cl. 184—7.

Fujita, Yoshimasa, and N. Tsutsui, to American Cyanamid Co. Method of treating acrylonitrile synthetic fibers. 3,273,956, 9–20–66, Cl. 8—55.

Fuller, Forney, Jr. Fusible plug flame detection system. 3,274,579, 9–20–66, Cl. 340—227.

Fulton, Bertram A.: *See*—
Becker, Stephen P., and Fulton. 3,274,330.

Funabashi, Tetsuo: *See*—
Kameyama, Akira, Funabashi, Kusakawa, Watanabe, Hayao, Takashima, and Maruyama. 3,274,420.

Funck, Dr. Ing., K.G.: *See*—
Reinert, Ernst, and Funck. 3,273,265.

Funck, Herbert: *See*—
Reinert, Ernst, and Funck. 3,273,265.

Furey, Michael J., to Esso Research and Engineering Co. Anti-wear oil additives. 3,273,981, 9–20–66, Cl. 44—66.

Fuss, Peter S.: *See*—
Dale, John C., and Fuss. 3,274,511.

Futterweit, Adolph: *See*—
Droege, Thomas F., Sandler, and Futterweit. 3,274,589.

Futurmill, Inc.: *See*—
Begle, John H. 3,273,222.

GS Equipment Co., The: *See*—
Crowley, Lewis E. 3,273,803.
Hull, Richard O., Jr. 3,273,802.

Gabor, John D., and M. G. Baerns, to United States of America, Atomic Energy Commission. Fluidization of sinterable fines. 3,273,974, 9–20–66, Cl. 23—352.

Gal, George: *See*—
Jones, Robert N., and Gal. 3,274,208.

Galer, Merrill F., and M. N. Stiles, to Time Inc. Trailing-blade coater including fluid seal. 3,273,536, 9–20–66, Cl. 118—413.

Gancher, Edward: *See*—
Dehn, Joseph W., Jr., Gancher, Kuhefuss, and Resnick. 3,274,173.
Pappas, James J., and Gancher. 3,274,228.

Gar de France (Service National): *See*—
Delaruelle, Jacques, and Constantin. 3,273,346.

Gardner, Henry F., and A. Staros, to United States of America, Army. Adjustable alignment coupling for lower extremity prostheses. 3,273,168, 9–20–66, Cl. 3—1.

Garlington, Ray D.: *See*—
Hutto, John F., Garlington, and Cabbage. 3,274,275.

Garmy, Robert J., and T. E. Perry, to Republic Steel Corp. Method of operating an electric furnace. 3,273,212, 9–20–66, Cl. 22—200.

Garris, Charles. Apparatus for retaining and processing dental X-ray films. 3,273,486, 9–20–66, Cl. 95—98.

Gary Industries, Inc.: *See*—
Feldmahr, Walter. 3,273,564.

Gas Drilling Services Co.: *See*—
Jackson, John G., and Vail. 3,273,660.

Gaschke, Marcel M., and M. L. Spector, to Pullman Inc. Process for pulping bagasse with ammonium hydroxide and oxygen. 3,274,049, 9–20–66, Cl. 162—65.

Gasparac, Rudolph J.: *See*—
Balmer, Hanajorg, and Gasparac. 3,273,808.

Gasparac, Rudolph J., A. P. Szaj, and W. Turnwald, to Nordberg Mfg. Co. Crusher clearing system. 3,273,810, 9–20–66, Cl. 241—290.

Gates Rubber Co., The: *See*—
Songer, Paul A. 3,274,316.

Gatsis, John G., to Universal Oil Products Co. Hydrorefining of petroleum crude oil and catalyst therefor. 3,274,098, 9–20–66, Cl. 208—264.

Gauthier, Alfred G.m.b.H.: *See*—
Starp, Frans W. R. 3,273,482.

Gay, Benjamin A.: *See*—
McGirr, Robert, and Gay. 3,274,363.

Gebhardt, Robert C., and J. S. Lory, said Gebhardt assor. to said Lory. Power control network. 3,274,484, 9–20–66, Cl. 323—93.

Geigy, J. R., A.G.: *See*—
Wachsmann, Hubert, Bindler, and Erny. 3,273,954.

Geiser, John D., Jr. Sand kart. 3,273,908, 9–20–66, Cl. 280—79.2.

Geller, Rodger E., and H. O. Waag, to General Motors Corp. Seat structure. 3,273,877, 9–20–66, Cl. 267—89.

General Aniline & Film Corp.: *See*—
Turetzky, Melvin N. 3,274,198.

Halpine, Joseph C., and Moroney. 3,274,351.
Howe, Ralph W. 3,273,375.

Halpern, Alfred, to Synergistics Inc. Acid addition salts of morpholine ethanol. 3,274,055, 9–20–66, Cl. 167—65.

Halpern, Alfred, and M. D. Sackler, to Synergistics, Inc. Sennoside derivatives and pharmaceutical compositions containing same. 3,274 053, 9–20–66, Cl. 167—65.

Halpine, Joseph C., and B. M. Moroney, to Halmor Industries, Inc. Switch for detecting piston in fluid flow line. 3,274,351. 9–20–66, Cl. 200—61.41.

Halverstadt, Carl D., 50% to A. L. Rothfeder. High precision caliper gage. 3,273,248. 9–20–66, Cl. 33—147.

Hamaker, Paul, G. C. Morgan, and J. R. Powell, Jr., to Transall, Inc. Process and apparatus for locking members to cables and the like. 3,273,695, 9–20–66, Cl. 198—192.

Hamilton, Charles E., to The Dow Chemical Co. Solvent extraction process. 3,274,104, 9–20–66, Cl. 210—39.

Hamilton, Charles M., and D. M. Kapral. Multi-passage muffler producing colliding fluid streams. 3,273,666, 9–20–66, Cl. 181—56.

Hamilton Mfg. Co.: *See*—
Amthor, Franklin R., Jr., Breivogel, Hoenle, Kanitz, and Katzfey. 3,273,517.

Hamisch, Paul H., Jr.: *See*—
Rieger, Frederic L., and Hamisch. 3.273.705.

Hammon, Edwin J., to Fountainhead Industries, Inc. Die set having aluminum oxide bearing susface. 3,273,944, 9–20–66, Cl. 308—4.

Handelsaktiebolaget Sanera: *See*—
Oberg, Per O. 3,273,840.

Handford, James B. Transportable float-supported centrifugal pump assembly. 3,273,507, 9–20–66, Cl. 103—87.

Handlovits, Carl E.: *See*—
Lenz, Robert W., Handlovits, and Carrington. 3,274,165.

Hanley, Michael A., to Polymer Corp. Casting device including a flash cavity defined in part by a gasket element. 3,273,205, 9–20–66, Cl. 18—39.

Hannan, Jerry M. Adjustable shock absorber and automatic control mechanism therefor. 3,273,876, 9–20–66, Cl. 267—11.

Hansa Bryggeri a/s: *See*—
Andersen, John M. 3,273,723.

Hansen, Richard C., and M. L. Levene, to Radio Corp. of America. Electrostatic web feeding apparatus. 3,273,774, 9–20–66, Cl. 226—50.

Hansen, Robert B., and H. C. Waldschmidt, to Motorola, Inc. Hue control circuits for color television receivers. 3,274,334, 9–20–66, Cl. 178—5.4.

Hansson, Thure H. Apparatus for controlling the moisture content in liquid-absorbing substances. 3,273,849, 9–20–66, Cl. 251—4.

Hardin, Johnny L., and H. R. Johnston, to Clark Equipment Co., Inc. Epoxy floor laying machine. 3,273,474, 9–20–66, Cl. 94—45.

Hardin, Martin A.: *See*—
Norton, Desmond H., and Hardin. 3,273,279.

Hari, Istvan: *See*—
Weber, Kurt, Staeuble, Hugelshofer, and Hari. 3,274,197.

Harling, Donald W., to McGraw-Edison Co. Light collector for photosensitive luminaire control. 3,274,392, 9–20–66, Cl. 250—227.

Harmon, George L., and W. O. Purcell, to Martin-Marietta Corp. Adaptive missile control system. 3,274,552, 9–20–66, Cl. 340—147.

Harp, Harry J., Jr., to Union Carbide Corp. Method of making a hollow elongated plastic article. 3,274,313, 9–20–66, Cl. 264—89.

Harper, Chester H.: *See*—
Allen, Kenneth M., and Harper. 3,273,698.

Harper, Leonard R., to International Business Machines Corp. Decoding device. 3,274,569, 9–20–66, Cl. 340—174.

Harrington, Robert C., Jr., and J. L. Smith, to Eastman Kodak Co. Stabilized yarn compositions. 3,274,014, 9–20–66, Cl. 106—177.

Harris, Glyn I., and H. S. B. Marshall, to Midland Silicones Ltd. Preparation of organopolysiloxane resins. 3,274,288, 9–20–66, Cl. 260—825.

Harris, John E., to Monsanto Research Corp. Pyrolysis of sodium tribromoacetate. 3,274,270, 9–20–66, Cl. 260—654.

Harris, Neville W., to English Electric Valve Co. Ltd. Travelling wave tube with band pass slow wave structure whose frequency characteristic changes along its length. 3,274,428, 9–20–66, Cl. 315—3.6.

Harrison, Lawrence V. Model aircraft wing construction. 3,273,281, 9–20–66, Cl. 46—76.

Harrover, Robert E., Jr., to Cowles Chemical Co. Brighteners and process for cyanide zinc electrodeposition. 3,274,080, 9–20–66, Cl. 204—55.

Harsányi, Kálman, D. Korbonits, K. Takács, L. Tardos, G. P. Lexzkovszky, and I. Erdély, to Cinoin Gyógyszer-és Vegyészeti Termékek Gyára RT. N-1,1-bis[aminophenyl]-propylamines and salts thereof. 3,274,248, 9–20–66, Cl. 260—570.

Hart, Charles G.: *See*—
Bauder, Carl J., Hart, and Cleminshaw. 3,273,321.

Hartman, Paul F., to United States of America, Navy. 2,2,2-trinitro ethyl alkyl sulfides. 3,274,259, 9–20–66, Cl. 260—609.

Hartung, Philip F., Jr. Bipod components and building units containing same. 3,273,299, 9–20–66, Cl. 52—648.

Hass, Karl: *See*—
Lenz, Arnold, Hass, Epler, and Luelsdorf-Feldmuehle. 3,274,261.

Hasund, John, to Thomas A. Short Co. Universal self-centering flange facing device. 3,273,432, 9–20–66, Cl. 82—4.

Hatcher, Cecil W., to Concut, Inc. Concrete sawing machine. 3,273,939, 9–20–66, Cl. 299—39.

Hausman, Albert F., and F. A. Chipils, to Amsted Industries, Inc. Shearing machine and method. 3,273,434, 9–20–66, Cl. 83—55.

Hawker Siddeley Aviation Ltd.: *See*—
Elstone, Paul M. L. 3,273,829.

Hayahi, Hiromi: *See*—
Nakajima, Jitsuji, Hayahi, and Onishi. 3,273,772.

Hayao, Shin, to Miles Laboratories, Inc. Quinazolinedione derivatives. 3,274,194, 9–20–66, Cl. 260—256.4.

Hayao, Takashi: *See*—
Kameyama, Akira, Funabashi, Kusakawa, Watanabe, Hayao, Takashima, and Maruyama. 3,274,420.

Haynes, Harold E., to Radio Corp. of America. Photocomposing system. 3,273,476, 9–20–66, Cl. 95—4.5.

Head & Johnson: *See*—
Street, Frederick A. 3,273,900.

Heckman, Earl H., and M. L. Jones, to United States of America, Navy. Solid state and hybrid modulators. 3,274,397, 9–20–66, Cl. 307—88.5.

Heeren, Hermann, to Maschinenfabrik Augsburg-Nurnberg AG. Internally finned condenser tube. 3,273,599, 9–20–66, Cl. 138—38.

Heiberger, Charles A., and D. S. Dixler, to Cumberland Chemical Corp. Films made from highly hydrolyzed polyvinyl alcohol. 3,274,020, 9–20–66, Cl. 117—68.

Heilman, James M.: *See*—
Senkewich, Alexander M. 3,273,529.

Heimberger, George J.: *See*—
Spillane, Matthew L., and Heimberger. 3,274,318.

Heine, Eckhard K., to Olof Fridlund. High-frequency welding apparatus. 3,274,370, 9–20–66, Cl. 219—10.53.

Heinsen, Edward A., to Hewlett-Packard Co. Voltage-to-frequency converter. 3,274,501, 9–20–66, Cl. 328—127.

Heinz, Alfred, to Western Electric Co. Inc. Apparatus for monitoring the spacing between a plurality of elements arranged in a series. 3,274,391, 9–20–66, Cl. 250—219.

Heitmeier, Donald E.: *See*—
Gray, Allan P., and Heitmeier. 3,274,190.

Heller, Milton D., R. H. Lenhard, and S. Bernstein, to American Cyanamid Co. Method of preparing pregnapentaenes. 3,274,180, 9–20–66, Cl. 260—239.55.

Heller, Peter V. N. Bistable element. 3,274,522, 9–20–66, Cl. 335—5.

Hempe Mfg. Co., Inc.: *See*—
Keddie, Burton G. 3,273,612.

Henchert, John, to Continental Can Co., Inc. Apparatus for and method of assembling a plastic pull tab with a metal tear strip. 3,273,234, 9–20–66, Cl. 29—453.

Henest Corp.: *See*—
Miller, Leon A. 3,273,770.

Henkel & Cie., G.m.b.H.: *See*—
Stein, Werner, Weiss, and Koch. 3,274,117.

Henriksen, Russell F.: *See*—
Willert, Clarence C., and Henriksen. 3,273,837.

Henninger, George D., to Amglo Corp. Reed driving mechanism. 3,274,409, 9–20–66, Cl. 310—46.

Hennis, Henry E., to The Dow Chemical Co. Cyclohexylmethyl toluates. 3,274,235, 9–20–66, Cl. 260—476.

Henry, Gary G. Animal halter. 3,273,311, 9–20–66, Cl. 54—24.

Hepner, Neal, to Burroughs Corp. Accounting machine perforator control system. 3,273,793, 9–20–66, Cl. 235—60.51.

Hercules, Inc.: *See*—
Breslow, David S., and Spurlin. 3,274,166.
Cook, Larry D. 3,273,775.

Hercules Powder Co.: *See*—
Matlack, Albert S. 3,274,152.

Herman, Elvin E.: *See*—
Varela, Arthur A., and Herman. 3,274,593.

Herry, Michel J., J. P. Le Corre, and G. R. Yelloz, to International Standard Electric Corp. Time division multiplex transmission systems. 3,274,339, 9–20–66, Cl. 179—15.

Herzo, Ellwood P., R. C. Hoefling, and A. B. Mewhinney, to General Motors Corp. Rotor conductor casting apparatus. 3,273,209, 9–20–66, Cl. 22—58.

Hess, Loyal H.: *See*—
Westbrook, Carl M., and Hess. 3,273,387.

Heugas, Jean L. G.: *See*—
Cheringou, Alfred H., and Heugas. 3,273,462.

Hewlett-Packard Co.: *See*—
Heinsen, Edward A. 3,274,501.

Hickey, Thomas N., and C. B. Hood, Jr., to Cryovac, Inc. Space simulation chamber. 3,273,636, 9–20–66, Cl. 165—67.

Hiers, James E., and E. J. Tischler, to Union Tank Car Co. Water conditioning system. 3,273,403, 9–20–66, Cl. 74—2.

High Voltage Engineering Corp.: *See*—
Emanuelson, Roy M. 3,274,526.

Higonnet, Rene A.: *See*—
Moyroud, Louis M., and Higonnet. 3,273,475.

Hill, Archie: *See*—
Doak, Kenneth W., and Hill. 3,274,167.

Hill, James J. Mono-frequency sound source. 3,273,530, 9–20–66, Cl. 116—137.

Hill, John C., to The Metal Box Co. Ltd. Method of applying container closure. 3,273,303, 9–20–66, Cl. 53—42.

Hill, Kenneth L.: *See*—
Treves, Gino R., Hill, and Dorschner. 3,273,992.

Hill, Paul R., and O. F. Trout, Jr., to United States of America, National Aeronautics and Space Administration. Heat protection apparatus. 3.273.355, 9–20–66, Cl. 62—467.

Hill, Robert M., and B. V. Dore, to General Telephone and Electronics Laboratories, Inc. Energy converter. 3,274,024. 9–20–66, Cl. 117—200.

Hill, Rowland M. Machine having multiple cutting action for cutting different types of plant stems at the same time. 3,273,239, 9–20–66, Cl. 30—206.

Hilliday, Theodore B. Method and apparatus for justifying right-hand margins. 3,273,685, 9–20–66, Cl. 197—84.

Hiltmann, Rudolf, H. Wollweber, F. Hoffmeister, and W. Wirth, to Farbenfabriken Bayer Aktiengesellschaft. 3-alkoxy-4-[alpha (N-substituted-carbamyl)-alkoxy]-benzoic acid esters. 3,274,187. 9–20–66, Cl. 260—247.2.

Himelreich, Louis E., and W. A. Dillen, to H. J. Scheirich Co. Method of making furniture drawers or the like and article produced thereby. 3,273,952, 9–20–66, Cl. 312—330.

Hines, Clyde K.: *See*—
Rosch, Francis C., Jr., and Hines. 3,273,851.

Hinman, Jack W., and R. B. Kelly, to The Upjohn Co. Arylhydrazides. 3.274,232, 9–20–66. Cl. 260—471.

Hinrichs, Karl to Beckman Instruments, Inc. Digital data correlator. 3.274.379, 9–20–66, Cl. 235—177.

Hirschbeck, Josef, and J. Riedl, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Process for removing nitric oxide from gas mixtures containing hydrogen and hydrocarbons. 3,274,281. 9–20–66, Cl. 260—677.

Hirshfield, Philip, to Tung-Sol Electric Inc. Thyratron and circuit therefor. 3,274,438, 9–20–66, Cl. 315—206.

Hitachi, Ltd.: *See*—
Tsubol, Takashi, Masutomi, and Onoda. 3,274,469.
Yoshida, Kasumi, and Shimada. 3,273,512.

Hiyama, Howard K.: *See*—
Hiyama, Kazuo and H. K. 3,273,667.

Hiyama, Kazuo and H. K. Harvesting scaffold for orchards. 3,273,667, 9–20–66, Cl. 182—129.

Hoben, Harold E.: *See*—
Vernon, Richard L., and Hoben. 3,273,831.

Hoddy, George W., G. L., and R. A., to Universal Electric Co. Bearing structure. 3,273,947, 9–20–66, Cl. 308—72.

Hoddy, George W., G. L., and R. A., to Universal Electric Co. Bearing structure. 3,273,948, 9–20–66, Cl. 308—72.

Hoddy, Gerald L.: *See*—
Hoddy, George W., G. L., and R. A. 3,273,947.
Hoddy, George W., G. L., and R. A. 3,273,948.

Hurwitz, Hyman. Music enhancement. 3,274,325, 9–20–66, Cl. 84—1.23.
Hurwitz, Melvin D., to Rohm & Haas Co. Polymerizable substituted-4-pentenamide monomers, polymers thereof, and methods for making and using these compositions. 3,274,164, 9–20–66, Cl. 260—78.5.
Husky Corp.: *See*—
Carder, Mervin L., and Sutcliffe. 3,273,609.
Hutson, Jearld L., to Electronic Control Corp. Symmetrically switching integrated semiconductor device. 3,274,463, 9–20–66, Cl. 317—235.
Hutto, John F., R. D. Garlington, and J. T. Cabbage, to Phillips Petroleum Co. Method for production of cyclohexane. 3,274,275, 9–20–66, Cl. 260—667.
Hyde, James F., and E. M. Schultz. Method of polymerizing hydroxylated organosilicon compounds. 3,274,153, 9–20–66, Cl. 260—46.5.
Hyland Laboratories: *See*—
Lou, Kingdon. 3,274,062.
Hyvert, Laurent, to Compagnie du Filage des Metaux et des Joints Curty (Cefilac). Apparatus for coating hot billets of optional shape with a lubricating powder. 3,273,534, 9–20–66, Cl. 118—308.
Idaho Concrete Pipe Co.: *See*—
Chanlund, Carl W. 3,273,217.
Ideal School Supply Co.: *See*—
Lovercheck, Corrie L. 3,273,261.
Ikeda, Hachiro, J. Yurimoto, and H. Ryu, to Sumitomo Chemical Co., Ltd. Method for manufacturing aluminum. 3,273,996, 9–20–66, Cl. 75—68.
Imperial Tobacco Co. of Canada Ltd.: *See*—
Maclennan, Norman D. 3,273,306.
Improved Machinery Inc.: *See*—
Thurston, Robert E. 3,273,696.
Ingersoll-Rand Co.: *See*—
Hall, Thomas E. 3,273,805.
Ingram, Alvin R., to Koppers Co., Inc. Self-extinguishing expandable polymers containing volatile hydrocarbon, organic bromide, and N-nitroso secondary amine. 3,274,133, 9–20–66, Cl. 260—2.5.
Inso Electronic Products, Inc.: *See*—
Nixon, Charles E. 3,274,037.
Institute for Atomenergi: *See*—
Kierulf, Birger C., and Westrum. 3,274,065.
Interchemical Corp.: *See*—
Dehn, Joseph W., Jr., Gancher, Kubefuss, and Resnick. 3,274,173.
Pappas, James J., and Gancher. 3,274,228.
Intermountain Research & Development Corp.: *See*—
Miller, Warren S. 3,273,959.

JFD Electronics Corp.: *See*—
Seiden, Hugo. 3,274,464.
Spielman, Ralph, and Taub. 3,274,465.
Jacke, Stanley E., to Branson Instruments, Inc. Ultrasonics. 3,274,033, 9–20–66, Cl. 148—12.9.
Jackson, Charles E., to General Dynamics Corp. Variable airfoil high-lift slat and slot for aircraft. 3,273,826, 9–20–66, Cl. 244—42.
Jackson, John G., and C. O. Vail, to Gas Drilling Services Co. Method and apparatus for changing single drill pipe strings to dual drill pipe strings. 3,273,660, 9–20–66, Cl. 175—57.
Jackson, Winston J., Jr.: *See*—
Perry, Kenneth P., Jackson, and Caldwell. 3,274,156.
Jacobi, Arno M., to Walter Jacobi & Sons, Inc. Swingable support device. 3,273,938, 9–20–66, Cl. 297—426.
Jacobi, Walter, & Sons, Inc.: *See*—
Jacobi, Arno M. 3,273,938.
Jacobs, Joseph J., and D. R. Basco, to Allis-Chalmers Mfg. Co. Extraction connection for double casing machine. 3,273,510, 9–20–66, Cl. 103—111.
Jacuzzi Bros. Inc.: *See*—
Jacuzzi, Candido. 3,273,560.
Jacuzzi, Candido, to Jacuzzi Bros. Inc. Hydrotherapy unit. 3,273,560, 9–20–66, Cl. 128—66.
Jakob, Franz, to Agfa Aktiengesellschaft. Cameras with built-in flash assemblies. 3,273,479. 9–20–66, Cl. 95—11.
James, Harry A., to The Ryan Aeronautical Co. Double delta flexible wing. 3,273,828, 9–20–66, Cl. 244—43.
Jamieson, Archie W. H., to Plessey-U.K. Ltd. Motor-driven pump units. 3,273,506, 9–20–66, Cl. 103—87.
Janssen Pharmaceutica N.V.: *See*—
Raeymaekers, Alfons H. M., Thienpont, and Demoen. 3,274,209.
Jansson, Ake E.: *See*—
Ytterfors, Sven L., and Jansson. 3,273,658.
Janusz, Stanislaw A., and J. Pawliw, to Atomic Energy of Canada Ltd. Latch device for nuclear fuel. 3,274,071, 9–20–66, Cl. 176—77.
Jenkins, James D., and C. B. Reynolds, to Kaiser Aluminum & Chemical Corp. Apparatus for applying metal cases to bricks. 3,273,373, 9–20–66, Cl. 72—316.
Jennings, David C., to United Aircraft Corp. Turbine driven rotary liquid-gas separation system. 3,273,324, 9–20–66, Cl. 55—404.
Jennings Radio Mfg. Corp.: *See*—
Tetz, Ronald V. 3,274,483.
Jensen, Alfred K.: *See*—
Brahm, Clarence P., and Jensen. 3,273,731.
Jepsen, Paul H., to Synder & Black & Schlegel. Bracket adapted to attach to a display pole to a container. 3,273,845, 9–20–66, Cl. 248—226.
Jepson, Ivar, J. P. Wied, and G. R. Wolter, to Sunbeam Corp. Vacuum cleaner. 3,273,194, 9–20–66, Cl. 15—323.
Jepson, Ivar, and J. P. Wied, to Sunbeam Corp. Push-broom-type vacuum cleaner. 3,273,195, 9–20–66, Cl. 15—344.
Jerue, Richard A.: *See*—
Dziedzic, Harry R., and Jerue. 3,273,235.
Jira, Reinhard: *See*—
Kojer, Hugo, Jira, Smidt, and Stangl. 3,274,238.
Jobes, Harry W., to Hupp Corp. Heat pump controls. 3,273,635, 9–20–66, Cl. 165—12.
Jochim, Friedrich, to Compagnie de Saint-Gobain. Self-gripping tongs. 3,273,933, 9–20–66, Cl. 294—118.
Johns, Iral B., to Monsanto Research Corp. Silicon-containing poly(nitriilomethylidynes). 3,274,128, 9–20–66, Cl. 260—2.
Johnson, Alfred D., to Sylvania Electric Products Inc. Read-out device having bonding material between a face panel and a cover panel. 3,274,421, 9–20–66, Cl. 313—109.5.
Johnson, Dolores: *See*—
Johnson, Eldon A. 3,273,870.
Johnson, Eldon A., deceased (by D. Johnson, administratrix), to ACF Industries, Inc. Carburetor. 3,273,870, 9–20–66, Cl. 261—41.
Johnson, Frank E., and T. E. Lewis, to Rietz Mfg. Co. Air lift drier. 3,273,257, 9–20–66, Cl. 34—57.
Johnson, Irving A., and S. Stasenko, to A. O. Smith Corp. Pumping system and leak detection unit control therefor. 3,273,753, 9–20–66, Cl. 222—52.
Johnson & Johnson: *See*—
Russell, Gordon D., and Skiejka. 3,274,016.
Johnson, Mead & Co.: *See*—
Weber, Abraham. 3,274,058.
Johnston, Gene W., R. I. Malani, and M. W. Scott, to Warner-Lambert Pharmaceutical Co. Process for stabilising shellac coating. 3,274,061, 9–20–66, Cl. 167—82.
Johnston, Harold R.: *See*—
Hardin, Johnny L., and Johnston. 3,273,474.
Johnston, William J., to General Motors Corp. Igniter plug with spark-sensing means. 3,274,487, 9–20–66, Cl. 324—17.
Joly, Robert, J. Warnant, and B. Goffinet, to Roussel-UCLAF. Process of preparation of unsaturated tricyclic esters. 3,274,233, 9–20–66, Cl. 260—473.
Jones, David L., to United States of America, Army. Twelve-state timing pulse generator using trailing edge triggering. 3,274,498, 9–20–66, Cl. 328—42.
Jones, Francis L., to Lockheed Aircraft Corp. High-temperature resistant self-healing coating and method of application. 3,274,007, 9–20–66, Cl. 106—55.
Jones, Gerald W., to The Maytag Co. Timer transmission. 3,273,421, 9–20–66, Cl. 74—705.
Jones, James H.: *See*—
Cragoe, Edward J., Jr., and Jones. 3,274,192.
Jones, Martin L.: *See*—
Heckman, Earl H., and Jones. 3,274,397.
Jones, Robert N., and G. Gal, to Merck & Co., Inc. Processes for preparing 2-triasolylbenzimibasole compounds. 3,274,208, 9–20–66, Cl. 260—302.
Jones, Wray H., O. G. Maxson, and B. W. Terry, to Continental Oil Co. Device for removing entrained gases from viscous liquids. 3,273,319, 9–20–66, Cl. 55—199.
Jongkind, Jan C., and P. G. Kenedi, to M & T Chemicals Inc. Stannate coating bath and method of coating aluminum with tin. 3,274,021, 9–20–66, Cl. 117—130.
Joo, Louis A.: *See*—
Wolfram, George, Szawlowski, and Joo. 3,274,108.
Kramer, Walter E., Joo, and Haines. 3,274,161.
Joo, Louis A., and T. H. Szawlowski, to Union Oil Co. of California. Unsaturated polyesters prepared from complex sulfur-containing carboxylic acids derived from petroleum. 3,274,292, 9–20–66, Cl. 260—867.
Jordal, Robert L., to Al-Vent Inc. Reticulated sun shade or grill. 3,273,298, 9–20–66, Cl. 52—473.
Joslin, Clarence A., to Goodman Mfg. Co. Portable conveyor. 3,273,694, 9–20–66, Cl. 198—129.
Juilfs, Albert G., and G. C., and C. T. Becht, to Senco Products, Inc. Easy clear guide body. 3,273,777, 9–20–66, Cl. 227—123.
Juilfs, George C.: *See*—
Juilfs, Albert G., and G. C., and Becht. 3,273,777.
Julian, Percy L., and A. Magnani, to Smith Kline & French Laboratories. Method for preparing 16α-hydroxypregnenes and intermediates obtained therein. 3,274,178, 9–20–66, Cl. 260—239.55.
Julien, Harry A., and C. J. Robinson, to General Motors Corp. Cylinder inlet passage for an internal combustion engine. 3,273,551, 9–20–66, Cl. 123—188.
Junkers & Co. G.m.b.H.: *See*—
Puttfarcken, Heinrich. 3,273,628.
Junts, Robert S.: *See*—
Borch, Niels R., and Junts. 3,273,557.
Justice, John L., to FMC Corp. Method of making clear cellulose films from green viscose. 3,274,321, 9–20–66, Cl. 264—189.
Justus, Edgar J., to Beloit Corp. Suction roll counter-deflector. 3,273,492, 9–20–66, Cl. 100—90.
K.G.M. Electronics Ltd.: *See*—
Pearce, John P. 3,273,274.
Kabushiki Kaisha Hitachi Seisakusho: *See*—
Aoki, Yonesaku, Emoto, and Tanaka. 3,273,806.
Nagata, Minoru. 3,274,446.
Oya, Yuichiro. 3,274,553.
Tomita, Hiroshi. 3,274,385.
Kado, Masaru, T. Tsuboi, T. Maeda, and E. Yoshinaga, to Shara Chemicals Co. Ltd. Methods for killing plant fungi. 3,274,051, 9–20–66, Cl. 167—30.
Kaiser Aluminum & Chemical Corp.: *See*—
Jenkins, James D., and Reynolds. 3,273,373.
Kalz, Anthony C., to Schlueter Mfg. Co. Combined latch and handle structure. 3,273,747, 9–20–66, Cl. 220—95.
Kamens, Bruce H., to Consolidated Electronics Industries Corp. Starting and damping circuitry for a transistorised governing system. 3,274,473, 9–20–66, Cl. 318—311.
Kameyama, Akira, T. Funabashi, I. Kusakawa, J. Watanabe, T. Hayao, Y. Takashima, and N. Maruyama, to Tokyo Shibaura Electric Co., Ltd. Annular fluorescent lamps. 3,274,420, 9–20–66, Cl. 313—109.
Kamienski, Conrad W., and D. H. Lewis, to Lithium Corp. of America, Inc. Preparation of stable non-pyrophoric organometallic compositions. 3,274,118, 9–20–66, Cl. 252—182.
Kanazawa, Fujio: *See*—
Koike, Eiji, and Kanazawa. 3,274,172.
Kaneko, Kunio: *See*—
Oshiba, Jun, Umeda, and Kaneko. 3,273,684.
Kania, Walter C.: *See*—
Armour, Walter B., and Kania. 3,274,048.

Kanitz, Roy E.: *See*—
Amthor, Franklin R., Jr., Breivogel, Hoenle, Kanitz, and Katzfey. 3,273,517.

Kantfall Products Corp.: *See*—

Kapral, Daniel M.: *See*—
Hamilton, Charles M., and Kapral. 3,273,666.

Kapur, Brij L., and R. D. Eccles, to Continental Oil Co. Preparation of detergent alkylates. 3,274,278, 9–20–66, Cl. 260—671.

Karkalits, Olin C., Jr., and C. A. Leatherwood, to Petro-Tex Chemical Corp. Dehydrogenation process. 3,274,284, 9–20–66, Cl. 260—680.

Karn, Andrew B. Dispensing device. 3,274,038, 9–20–66, Cl. 156—247.

Karton, Joseph, to Deluxe Reading Corp. Doll joint construction for cooperation with hair rooting machine. 3,273,280, 9–20–66, Cl. 46—161.

Kaszynski, Albert Z.: *See*—
Boudreau, Thomas K., and Kaszynski. 3,274,444.

Katzfey, James M.: *See*—
Amthor, Franklin R., Jr., Breivogel, Hoenle, Kanitz, and Katzfey. 3,273,517.

Kauffman, Lloyd O., Jr.: *See*—
Bunt, Edgar A., Kauffman, Olsen, and Raezer. 3,274,424.

Kaufmann, Henry H., and D. E. Fiscus, to Cargill Inc. Probe Sampler. 3,273,401, 9–20–66, Cl. 73—421.
401, 9–20–66, Cl. 73—421.

Kaufmann, Karl, and A. Sievers, to Mechanische Weberei G.m.b.H. Projection screen. 3,273,455, 9–20–66, Cl. 88—28.9.

Kavanaugh, Richard J., to Consolidated Electronics Industries Corp. Micro-miniature motor structure. 3,274,411, 9–20–66, Cl. 310—164.

Kawamura, Yuzo, to Tokan Kogyo Co., Ltd. Process for unitized construction of synthetic resin board or cylinder. 3,274,315, 9–20–66, Cl. 264—93.

Kay, Alan F., to Control Data Corp. Wide angle horn feed closely spaced to main reflector. 3,274,603, 9–20–66, Cl. 343—781.

Kearney-National Inc.: *See*—
Sullivan, Robert S., and Ortwig. 3,274,364.

Kearney & Trecker Corp.: *See*—
Stobbe, Richard E., and Zankl. 3,273,413.

Keddie, Burton G., to Hempe Mfg. Co., Inc. Miter box with magnetic saw guides. 3,273,612, 9–20–66, Cl. 143—89.

Keedy, Edgar L. Inflatable pontoon for aircraft. 3,273,832, 9–20–66, Cl. 244—105.

Keeling, Fred D., to Irving Air Chute Co., Inc. Safety belt buckle. 3,273,214, 9–20–66, Cl. 24—230.

Keller, Charles H.: *See*—
Paquette, Raymond E., and Keller. 3,274,427.

Kelly, Neal B., to E. I. du Pont de Nemours and Co. Analytical logarithmic ratio determination apparatus. 3,273,448, 9–20–66, Cl. 88—14.

Kelly, Ronald B.: *See*—
Hinman, Jack W., and Kelly. 3,274,232.

Kelso, Elgin L., to Tyler Corp. Rear unloading box. 3,273,728, 9–20–66, Cl. 214—82.

Kelyman, Jacqueline S.: *See*—
Reifschneider, Walter, and Kelyman. 3,274,257.

Kendall Co., The: *See*—
Spicer, Ronald F. 3,273,224.

Kendrick, Thomas C., and D. R. Thomas, to Midland Silicones Ltd. Polymerization of cyclic siloxanes. 3,274,154, 9–20–66, Cl. 260—46.5.

Kenedi, Peter G.: *See*—
Jongkind, Jan C., and Kenedi. 3,274,021.

Kennepohl, Kenneth K. Balanced pressure pump for liquid petroleum fuel. 3,273,584, 9–20–66, Cl. 137—209.

Kennepohl, Kenneth K. Liquid petroleum fuel cleaner. 3,273,716, 9–20–66, Cl. 210—120.

Kenney, Mahlon W.: *See*—
De Shon, Le Roy F., and Kenney. 3,273,748.

Kerner, Vernon H., to Emerson Electric Co. Guidance systems. 3,273,825, 9–20–66, Cl. 244—14.

Kerr-McGee Oil Industries, Inc.: *See*—
Zajic, James E., and Dunlap. 3,274,074.

Kerst, Donald W., to General Dynamics Corp. Method of injecting and trapping particles in a static magnetic confining field by bunching particles in a beam. 3,274,435, 9–20–66, Cl. 315—111.

Kersting, Hans. Device for aerating fermenting liquids in particular for the production of bakers' yeast. 3,274,075, 9–20–66, Cl. 195—142.

Kertis, Joseph R.: *See*—
Pool, Eldert B., Kertis, and Hollingsworth. 3,273,853.

Keskkula, Henno, and C. A. Leatherman, to The Dow Chemical Co. Lubricated polycarbonate compositions. 3,274,144, 9–20–66, Cl. 260—32.6.

Kesten, Patrick N., to General Motors Corp. Spark plug with multiple conductive seals. 3,274,423, 9–20–66, Cl. 313—145.

Kestin, Lorenz, Bauunternehmung: *See*—
Kesting, Lorenz. 3,274,306.

Kesting, Lorenz, to Lorenz Kestin Bauunternehmung. Method for casting concrete structures. 3,274,306, 9–20–66, Cl. 264—34.

Keyes Fibre Co.: *See*—
Burt, Donald E. 3,273,307.

Keys, Don L., J. P. Broderick, and F. G. Lohnes, to Eutectic Welding Alloys Corp. Remote powder feed for flame spraying torch. 3,273,800, 9–20–66, Cl. 239—85.

Kidwell, Robert P. Apparatus for controlling conductive fluids. 3,273,336, 9–20–66, Cl. 60—35.6.

Kiefer, Jeffrey N. Welding crutch. 3,273,881, 9–20–66, Cl. 269—321.

Kiefer, Michael C. Windsurfer. 3,273,528, 9–20–66, Cl. 114—61.

Kierulf, Birger C., and T. Westrum, to Institute for Atomenergi. Nuclear reactor with jet pump arrangement for obtaining forced liquid circulation. 3,274,065, 9–20–66, Cl. 176—61.

Kieserling, Th., & Abbrett: *See*—
Pohler, Carl L., and Breuer. 3,273,364.

Killmeyer, Donald J., to Calgon Corp. Detergent feed systems. 3,273,586, 9–20–66, Cl. 137—268.

Kincaid, William B., to Aladdin Industries, Inc. Variable capacitor. 3,274,466, 9–20–66, Cl. 317—252.

Kinder, Gotthard, to Voiglander, A.G. Photographic camera with built-in electronic flash device. 3,273,478, 9–20–66, Cl. 95—11.

King, Harry M.: *See*—
Horton, Jackson C., and King. 3,274,304.

Bell, Ronald L., Kino, and Mann. 3,274,431.

Kinsley, Charles W., to Glass Machinery Inc. Timer mechanism. 3,273,593, 9–20–66, Cl. 137—624.17.

Kiper, Gerd, to Agfa Aktiengesellschaft. Central photographic shutter. 3,273,481, 9–20–66, Cl. 95—63.

Kirsch Co.: *See*—
Ford, James A. 3,273,197.

Klaassen, William P., to Teer, Wickwire & Co. Linear gauge. 3,273,249, 9–20–66, Cl. 33—172.

Klass, Donald L., and V. Brozowski, to The Union Oil Co. of California. Preparation of sulfato-betaine-type compounds. 3,274,204, 9–20–66, Cl. 260—294.8.

Klein, Alfred, to Chemagnetics Controls, Inc. Apparatus for the chlorination of water. 3,274,094, 9–20–66, Cl. 204—275.

Klein, Seymour, to Radio Corp. of America. Character recognition system including circuits for locating characters and circuits for discriminating against noise. 3,274,550, 9–20–66, Cl. 340—146.3.

Kleinewefers, John: *See*—
Kleinwefers, Jan. 3,273,199.

Kleingers, Alfred B., Jr.: *See*—
Bergstein, Frank D., Kleingers, and Back. 3,274,307.

Kleinlein, Elmer W., to American Motors Corp. Vibrational damper. 3,273,670, 9–20–66, Cl. 188—1.

Kleinwefers, Jan, to J. Kleinewefers. Calender for drawing foils and the like of synthetic material. 3,273,199, 9–20–66, Cl. 18—2.

Kleist, Dale, H. J. Snow, and C. S. Buchanan, to Owens-Corning Fiberglas Corp. Method of and apparatus for forming fibers. 3,273,358, 9–20–66, Cl. 65—6.

Klima, Robert, to Robert Klima Firma. Shoe, in particular, ski-boot. 3,273,263, 9–20–66, Cl. 36—2.5.

Klima, Robert, Firma: *See*—
Klima, Robert. 3,273,263.

Klockner-Humboldt-Deutz Aktiengesellschaft: *See*—
Oestreicher, Georg, and Oberlander. 3,273,515.

Kluiber, Rudolph W., to Union Carbide Corp. Polyester imides of trimellitic anhydride. 3,274,159, 9–20–66, Cl. 260—75.

Knapsack Aktiengesellschaft: *See*—
Ritter, Friedbert, Rodis, Reuter, and Querengasser. 3,273,965.

Knoth, Roy J., R. D. Schelleng, and C. R. Isleib, to The International Nickel Co. Chill-cast ductile iron rolling mill rolls. 3,273,998, 9–20–66, Cl. 75—128.

Knudsen, Raymond G., J. W. Price, and G. E. Olson, to Snap-On Tool Corp. Wrench sockets, socket drives and similar couplers. 3,273,430, 9–20–66, Cl. 81—121.

Kobayashi, Tadahiro, to Asahi Kasei Kogyo Kabushiki Kaisha. Compositions and methods of stabilizing unsaturated organic nitriles. 3,274,231, 9–20–66, Cl. 260—465.9.

Koch, Otto: *See*—
Stein, Werner, Weiss, and Koch. 3,274,117.

Koch, Walter T.: *See*—
Massengale, John T., and Koch. 3,274,298.

Koch, Winfield R., to United States of America, Navy. Video gate with pedestal cancellation. 3,274,499, 9–20–66, Cl. 328—99.

Koculyn, George. Hydraulic Mechanism including pilot control responsive to atmospheric conditions. 3,273,579, 9–20–66, Cl. 137—80.

Koehring Co.: *See*—
Alexander, Thomas E., and Nelson. 3,273,650.

Koffinke, Richard A., to Bird Machine Co. Solid bowl centrifuge with air circulation control. 3,273,789, 9–20–66, Cl. 233—7.

Kohl, Lou, to The Celotex Corp. Method of making a porous ceramic product. 3,274,310, 9–20–66, Cl. 264—43.

Kohler, Hans W., to United States of America, Army. Optical delay system for providing eye protection against intense light. 3,273,458, 9–20–66, Cl. 88—61.

Kolke, Eiji, and F. Kanazawa, to Sumitomo Chemical Co., Ltd., and Toyo Spinning Co., Ltd. Disazo disperse dyestuffs. 3,274,172, 9–20–66, Cl. 260—187.

Kojer, Hugo, R. Jira, J. Smidt, and H. Stangl, to Consortium für Elektrochemische Industrie G.m.b.H. Production of unsaturated esters by oxidation of olefins. 3,274,238, 9–20–66, Cl. 260—497.

Kokusai Denshin Denwa Kabushiki Kaisha: *See*—
Kurimura, Toshio, and Yamamura. 3,274,479.

Kollmann, Franz G., and F. Laussermair, to BMW Triebwerkbau G.m.b.H. Balancing weight construction. 3,273,419, 9–20–66, Cl. 74—573.

Kollonitsch, Janos, to Merck & Co., Inc. Processes for preparing thiazole carboxylic acids. 3,274,207, 9–20–66, Cl. 260—302.

Kollsman Instrument Corp.: *See*—
Moskowitz, Saul. 3,274,380.
Moskowitz, Saul. 3,274,549.
Zuckerbraun, Jacob S. 3,274,393.

Koltun, Leo H. Sewing machine method for producing an envelope. 3,273,524, 9–20–66, Cl. 112—262.

Kolze, Lawrence A., to The Dole Valve Co. Zone valve. 3,273,850, 9–20–66, Cl. 251—11.

Kongelbeck, Sverre, to United States of America, Navy. Self-erecting folding fin. 3,273,500, 9–20–66, Cl. 102—50.

Koppers Co., Inc.: *See*—
Doak, Kenneth W., and Hill. 3,274,167.
Ingram, Alvin R. 3,274,133.

Koppy Tool & Die Co.: *See*—
De Gain, William J. 3,273,601.

Korbonits, Dezső: *See*—
Harsányi, Kálman, Korbonits, Takács, Tardos, Lexzkovszky, and Erdély. 3,274,248.

Koret, Inc.: *See*—
Koret, Richard. 3,273,678.

Koret, Richard, to Koret, Inc. Foldable luggage bag. 3,273,678, 9–20–66, Cl. 190—43.

Koutz, Stanley L., and R. F. Turner, to United States of America, Atomic Energy Commission. Fuel element. 3,274,068, 9–20–66, Cl. 176—69.

Krafft, Joseph M., and W. A. Stolz. Tension-compression testing machine. 3,273,383, 9–20–66, Cl. 73—93.

Kramer, Walter. Method and apparatus for cooling burned materials discharged by a furnace for burning cement, magnesite, lime or the like. 3,273,255, 9–20–66, Cl. 34—20.

Kramer, Walter E., L. A. Joo, and R. M. Haines, to Union Oil Co. of California. Polymers of N-N'-tetrahydro-bipyridylbiquinolyl and -biacridyl dicarboxylic acid derivatives. 3,274,161, 9–20–66, Cl. 260—77.5.

Krause, Robert, KG: *See*—
Hoffmann, Fritz. 3,278,719.

Krikorian, Garo, to Rice Barton Corp. Trailing-blade-coater including adjustable drag-blade. 3,273,535, 9–20–66, Cl. 118—410.

Kubisiak, Donald P.: *See*—
Giesner, William K., Thompson, and Kubisiak. 3,274,136.

Kuhbier, Carl. Pliers having a camming lever member trapped between jaw members. 3,273,238, 9–20–66, Cl. 30—189.

Kuhefuss, Harold J.: *See*—
Dehn, Joseph W., Jr., Gancher, Kuhefuss, and Resnick. 3,274,173.

Kuhn, Gerhard: *See*—
Menzel, Karl-Heinz, Wahl, and Kuhn. 3,274,001.

Kuiper, Dan B., to General Motors Corp. Exhaust manifold heat valve. 3,273,798, 9–20–66, Cl. 236—93.

Kulp, John F., Jr., to General Electric Co. Spin casting paraboloidal surfaces. 3,274,301, 9–20–66, Cl. 264—1.

Kuntz, Louis E.: *See*—
Fluegel, Dale A., and Kuntz. 3,273,576.

Kuo, George C.-C., to Castle & Cooke, Inc. Vertical lift. 3,273,735, 9–20–66, Cl. 214—522.

Kurimura, Toshio, and K. Yamamura, to Kokusai Denshin Denwa Kabushiki Kaisha. Rectifying apparatus for producing constant voltage. 3,274,479, 9–20–66, Cl. 321—25.

Kuris, Arthur, and L. Balamuth, to Cavitron Ultrasonics Inc. Ultrasonic grinding and honing. 3,273,288, 9–20–66, Cl. 51—72.

Kurtz, Albert J. Powdered or granular material dispensing device. 3,273,764, 9–20–66, Cl. 222—480.

Kusakawa, Ichiro: *See*—
Kameyama, Akira, Funabashi, Kusadawa, Watanabe, Hayao, Takashima, and Maruyama. 3,274,420.

Kvaternik, Frank A., to United States Steel Corp. Apparatus and method for centering a conveyor belt. 3,273,697, 9–20–66, Cl. 198—202.

Laboratories for Electronics, Inc.: *See*—
Nathanson, Leslie. 3,274,519.

Lacasse, Adrien R., to Pittsburgh Plate Glass Co. Method for forming and winding glass strands. 3,273,812, 9–20–66, Cl. 242—42.

Ladd, Charles M. Solution concentration control and make-up system. 3,273,580, 9–20–66, Cl. 137—93.

Laity, Max. Electronic equipment cabinet. 3,274,451, 9–20–66, Cl. 317—122.

Lamb, Frank G., to Lamb-Weston, Inc. High-speed mechanism for segmenting crinkle cut vegetables. 3,273,617, 9–20–66, Cl. 146—78.

Lamb, Joe H., to Cover Pools Inc. Carrier for forward edge of extendible and retractable flexible sheet. 3,273,171, 9–20–66, Cl. 4—172.

Lamb-Weston, Inc.: *See*—
Lamb, Frank G. 3,273,617.

Lambuth, Alan L., to Monsanto Co. Highly reactive alkaline phenol-formaldehyde condensates. 3,274,139, 9–20–66, Cl. 260—29.3.

Lamping, Robert F.: *See*—
Fausek, Irwing F., and Lamping. 3,273,587.

Lancy Laboratories, Inc.: *See*—
Lancy, Leslie E. 3,273,866.

Lancy, Leslie E., to Lancy Laboratories, Inc. Constant flow aerator and siphon breaker. 3,273,866, 9–20–66, Cl. 261—19.

Landbrecht, Franz: *See*—
Winkler, Alfred, Landbrecht, and Engelsmann. 3,273,480.

Landers, Richard R., to Thompson Ramo Wooldridge Inc. Self-repairing and self-sustaining system. 3,274,401, 9–20–66, Cl. 307—92.

Landes, Lewis G., to Barnes & Reinecke, Inc. Degausser. 3,274,452, 9–20–66, Cl. 317—157.5.

Landis Machine Co.: *See*—
Eigenbrode, Edwin M. 3,273,253.

Lang, Konrad: *See*—
Goerrig, Dieter, Schubert, Weise, and Lang. 3,273,955.

Lang, Theodore R.: *See*—
Voderberg, Kurt E., and Lang. 3,273,907.

Langen, Peter, to Frans Clouth Rheinsche Gummuwarenfabrik Aktiengesellschaft. Agitator for granular materials and the like. 3,273,761, 9–20–66, Cl. 222—386.5.

Lansing Bagnall Ltd.: *See*—
Goodacre, Cecil. 3,273,665.

Lapinski, Francis A., to Minneapolis-Honeywell Regulator Co. Electrical apparatus. 3,274,586, 9–20–66, Cl. 340—347.

Lapsley, Charles H. Camera supports. 3,273,484, 9–20–66, Cl. 95—86.

Lardin, Arthur R. Launcher for stores. 3,273,459, 9–20–66, Cl. 89—1.5.

Larsen, Ludolph: *See*—
Blomquist, Arthur G., Larsen, Neuman and Wermager. 3,274,348.

Lasater, Reginald M.: *See*—
Billings, William E., and Lasater. 3,273,643.

Latella, Giovanni: *See*—
Compstella, Mario, Del Mauro, and Latella. 3,274,312.

Lauer, James L., to Sun Oil Co. Process for the preparation of ethane by flash photolysis. 3,274,087, 9–20–66, Cl. 204—162.

Launay, Pierre. Screws. 3,273,442, 9–20–66, Cl. 85—45.

Laussermair, Friedrich: *See*—
Kollmann, Franz G., and Laussermair. 3,273,419.

La Vine, Paul F.; ½ to A. V. Oberholtzer. Impregnation and coating with split-offs of vermiculite and products thereof. 3,274,019, 9–20–66, Cl. 117—16.

Leatherman, Cleown A.: *See*—
Keskkula, Henno, and Leatherman. 3,274,144.

Leatherwood, Clyde A.: *See*—
Karkalits, Olin C., Jr., and Leatherwood. 3,274,284.

Lebourg, Maurice P., and J. T. Dewan, to Schlumberger Well Surveying Corp. Well production methods and apparatus. 3,273,639, 9–20–66, Cl. 166—4.

Lecher, Marilyn T., to Sun Oil Co. Polypropylene stabilization. 3,274,146, 9–20–66, Cl. 260—41.

Le Corre, Jean P.: *See*—
Herry, Michel J., Le Corre, and Yelloz. 3,274,339.

Lednicer, Daniel, to The Upjohn Co. Alkoxy-substituted 2-phenyl - 1 - (tertiaryaminoalkoxy) phenyl - 3,4-dihydronaphthalenes. 3,274,213, 9–20–66, Cl. 260—326.5.

Leesona Corp.: *See*—
Maeder, Paul F. 3,273,896.

Lefort, Marcel J. C.: *See*—
Fritsch, Christian H. Y., and Lefort. 3,274,210.

Legarra, Philip H., and E. C. Hallett. Sealed coupling. 3,273,918, 9–20–66, Cl. 285—382.3.

Lemm, Hanns-Peter: *See*—
Schwarze, Gerhard, Lemm, Hover, and Wischeropp. 3,273,572.

Lenhard, Robert H.: *See*—
Heller, Milton D., Lenhard, and Bernstein. 3,274,180.

Lenz, Robert W., C. E. Handlovits, and W. K. Carrington, to The Dow Chemical Co. Method for preparing linear polyarylene sulfide. 3,274,165, 9–20–66, Cl. 260—79.

Leonard, Byron H., Jr., to Internuclear Co. Activation analysis nuclear reactor and spool-like fuel element therefor. 3,274,064, 9–20–66, Cl. 176—20.

Lesher, Kenneth W., to Standard Screw Co. Hydraulic tappet with metering means. 3,273,547, 9–20–66, Cl. 123—90.

Leslie, James D.: *See*—
Brissette, Lawrence P., and Leslie. 3,273,286.

Lester, George R., and C. J. Adams, to Universal Oil Products Co. Dehydrohalogenation process. 3,274,273, 9–20–66, Cl. 260—666.

Le Suer, William M.: *See*—
Norman, George R., and Le Suer. 3,274,135.

Le Suer, William M., and C. J. Dorer, Jr., to The Lubrizol Corp. Operation of fuel oil burners. 3,273,980, 9–20–66, Cl. 44—63.

Levack, Walter R. Vacuum head for sweeping swimming pools. 3,273,188, 9–20–66, Cl. 15—1.7.

Le Vaux, Rene G.: *See*—
Brown, Adolph M. 3,273,562.

Levene, Martin L.: *See*—
Hansen, Richard C., and Levene. 3,273,774.

Lever Brothers Co.: *See*—
Goldwasser, Seymore, and Ryer. 3,274,119.

Levi, Richard J. Grinding. 3,273,290, 9–20–66, Cl. 51—165.

Levinson, Louis E., and E. J. Worley, to General Business Corp. Cleaning apparatus. 3,273,189, 9–20–66, Cl. 15—22.

Levy, Joseph, and A. Friedman, to Universal Oil Products Co. Method for producing monoalkyl ethers of dihydric phenols. 3,274,260, 9–20–66, Cl. 260—613.

Levy, Larry W., and H. M. Durst. Device for the automatic treatment of the air in an enclosed space having a door. 3,273,756, 9–20–66, Cl. 222—180.

Lewis, Bernard L. Multi-mode simultaneous lobing antenna. 3,2746,04, 9–20–66, Cl. 343—786.

Lewis, Dennis H.: *See*—
Kamienski, Conrad W., and Lewis. 3,274,118.

Lewis, Thomas E.: *See*—
Johnson, Frank E., and Lewis. 3,273,257.

Lexzkovszdy, György P.: *See*—
Harsányi, Kálman, Korbonits, Takács, Tardos, Lexzkovszky, and Erdély. 3,274,248.

Leybold Holding Aktiengesellschaft: *See*—
Noller, Hans G., and Bachler. 3,273,787.

Libbey-Owens-Ford Glass Co.: *See*—
Dean, Harry N., Morgan, and Flaherty. 3,273,988.

Libeer, Marcel J.: *See*—
Noe, Robert J., Libeer, and Nys. 3,274,000.

Mack Trucks, Inc.: *See*—
Donnelly, Leo F., Fischer, and Nall. 3,273,385.

Mackenzie, Alan K., to E. I. du Pont de Nemours and Co. Polyfluoropolyoxa-alkanamidoalkyl compounds. 3,274,244, 9–20–66, Cl. 260—561.

Maclennan, Norman D., to Imperial Tobacco Co. of Canada Ltd. Cigar packaging machine. 3,273,306, 9–20–66, Cl. 53—186.

MacLeod, David E.: *See*—
Bell, William W., Jr., and MacLeod. 3,273,843.

Maddox, James W., to Newport News Shipbuilding and Dry Dock Co. Steam drain and reheat device. 3,274,373, 9–20–66, Cl. 219—272.

Maeda, Hisao. Transistor-type broad band amplifier utilizing a choke coil. 3,274,506, 9–20–66, Cl. 330—21.

Maeda, Taizo: *See*—
Kado, Masaru, Tsuboi, Maeda, and Yoshinaga. 3,274,051.

Maeder, Paul F., to Leesona Corp. Tape recorder and tape storage magazine therefor. 3,273,896, 9–20–66, Cl. 274—11.

Maffet, Vere, to E. I. du Pont de Nemours and Co. Stabilizer for silver halide emulsions. 3,274,002, 9–20–66, Cl. 96—109.

Magerlein, Barney J., and R. D. Birkenmeyer, to The Upjohn Co. 1,3-dialkylprolines. 3,274,212, 9–20–66, Cl. 260—326.3.

Maget, Henri J. R., and G. F. Wheeler, to General Electric Co. Fuel cell electrode and methods of preparation. 3,274,031, 9–20–66, Cl. 136—120.

Magida, Nathan H., and W. W. Bachle, to Thermosen, Inc. Electromagnetic reed relay. 3,274,524, 9–20–66, Cl. 335—152.

Magnani, Arthur: *See*—
Julian, Percy L., and Magnani. 3,274,178.

Magnetfabrik Bonn Gewerkschaft Windhorst: *See*—
Muller, Werner. 3,274,303.

Magnuson, Genevieve L.: *See*—
Smith, Traver J. 3,273,711.

Magnuson, Robert: *See*—
Smith, Traver J. 3,273,711.

Magnuson, Roy: *See*—
Smith, Traver J. 3,273,711.

Maheu, Roland R. Alternator mounting assembly for vehicles. 3,274,394, 9–20–66, Cl. 290—1.

Mahler, Peter A., to The Singer Co. Pneumatic tensioning, everting, and discharging device and method for circular knitting machines. 3,273,360, 9–20–66, Cl. 66—149.

Maier, Alfred E., and H. S. Wingard, to Federal Pacific Electric Co. Circuit breaker having ambient temperature compensation. 3,274,357, 9–20–66, Cl. 200—116.

Malani, Ranjit I.: *See*—
Johnston, Gene W., Malani, and Scott. 3,274,061.

Mallory, P. R., & Co., Inc.: *See*—
Haberecht, Rolf R. 3,274,454.

Maltby, Peter D. R., to Her Majesty the Queen in the right of Canada as represented by the Minister of Mines and Technical Surveys. Production of low silica iron superconcentrates. 3,273,707, 9–20–66, Cl. 209—39.

Mann, Joseph K.: *See*—
Bell, Ronald L., Kino, and Mann. 3,274,431.

Mannesmann-Meer Aktiengesellschaft: *See*—
Von Dorp, Walter. 3,273,693.

Manz, August F., and J. F. Saenger, Jr., to Union Carbide Corp. Method of depositing metal. 3,274,371, 9–20–66, Cl. 219—137.

Marantz, Israel H., to Columbia Cable & Electric Corp. Apparatus for electroplating narrow strip. 3,274,092, 9–20–66, Cl. 204—224.

Marathon Oil Co.: *See*—
Biehl, James A. 3,274,097.

Marbert-Kosmetik, Roeber and Sendler, Firma: *See*—
Nieper, Hans A., and Escherich. 3,274,063.

Marchini, Paolo: *See*—
Sigal, Max V., Jr., Marchini, and Poet. 3,274,185.

Margus, Edward A., to Vanton Pump & Equipment Corp. Centrifugal pump. 3,273,509, 9–20–66, Cl. 103—103.

Marindin, Frederick R.: *See*—
Winter, Alpheus IV, Pane, and Marindin. 3,273,304.

Markiewitz, Kenneth H., to Atlas Chemical Industries, Inc. Ammonolysis process. 3,274,253, 9–20–66, Cl. 260—585.

Marples, David F.: *See*—
Goldsmith, William F., and Marples. 3,274,216.

Mars, Ray W.: *See*—
Creedle, Fred W., and Mars. 3,273,672.

Marshall, David W., and W. R. Sorenson, to Continental Oil Co. Preparation of alpha-olefins. 3,274,280, 9–20–66, Cl. 260—677.

Marshall, Hedley S. B.: *See*—
Harris, Glyn I., and Marshall. 3,274,288.

Marshall, Mervin D., to Callery Chemical Co. Production of chlorodifluoramine. 3,273,975, 9–20–66, Cl. 23—350.

Martin, Albert D.: *See*—
Gore, Graves T., Martin, and Smith. 3,273,522.

Martin, Vernon P., to The Continental Can Co. Forming colored patterns upon polyolefin surfaces. 3,273,498, 9–20–66, Cl. 101—426.

Martin-Marietta Corp.: *See*—
Harmon, George L., and Purcell. 3,274,552.

Martz, Roger G., to Stewart-Warner Corp. Pumping and metering device. 3,273,502, 9–20–66, Cl. 103—5.

Maruyama, Misaburo: *See*—
Kameyama, Akira, Funabashi, Kusakawa, Watanabe, Hayao, Takashima, and Maruyama. 3,274,420.

Marsocchi, Alfred, and W. H. Otto, to Owens-Corning Fiberglas Corp. Coating fibrous glass yarns. 3,273,987, 9–20–66, Cl. 65—60.

Maschinefabrik Augsburg-Nurnberg AG.: *See*—
Heeren, Hermann. 3,273,599.

Mason, James D. Firearm with gas-operated breech block unlocking means. 3,273,460, 9–20–66, Cl. 89—185.

Massachusetts Institute of Technology: *See*—
El-Hefni, Ibrahim. 3,274,430.

Massengale, John T., and W. T. Koch, to FMC Corp. Coating composition for composite packaging sheets. 3,274,298, 9–20–66, Cl. 260—898.

Massengill, S. E., Co., The: *See*—
Sigal, Max V., Jr., Marchini, and Poet. 3,274,185.

Masso Remiro, Jose M. Process for the manufacture of mixed fabric and latex garments. 3,273,167, 9–20–66, Cl. 2—243.

Master Specialties Co.: *See*—
Hallerberg, Don M. 3,273,836.
Hallerberg, Don M. 3,274,358.
Stevens, Curtis R. 3,274,354.

Masutomi, Fumio: *See*—
Tsuboi, Takashi, Masutomi, and Onoda. 3,274,469.

Mastrup, Frithjof N., to Thompson Ramo Wooldridge Inc. High-intensity radiant energy source. 3,274,437, 9–20–66, Cl. 315—111.

Matheson, Wilfrid G., J. P. Clune, and T. J. Pricenski, to Sylvania Electric Products Inc. Electrical heating elements. 3,274,374, 9–20–66, Cl. 219—426.

Matthey, Roger, to Parechoc S.A. Shock-absorbing bearing for small mechanisms. 3,273,949, 9–20–66, Cl. 308—158.

Matty, Robert E.: *See*—
Rogers, Charles E., Matty, and Ralston. 3,273,961.

Maxeiner, Gottfried, to A. Ehrenreich & Cie. Ball and socket joint. 3,273,924, 9–20–66, Cl. 287—90.

Maxson, Orwin G.: *See*—
Jones, Wray H., Maxson, and Terry. 3,273,319.

Mayer, Ferdy, to Inventions Finance Corp. Electrohydraulic actuator. 3,273,594, 9–20–66, Cl. 137—625.66.

Maytag Co., The: *See*—
Jones, Gerald W. 3,273,421.

Mazzella, Louis. Paint roller device having a pivotally adjustable handle. 3,273,192, 9–20–66, Cl. 15—230.11.

McAfee, Kyle E., Jr., to The New York Air Brake Co. Pilot operated unloading valve having relatively adjustable loading and unloading limits. 3,273,581, 9–20–66, Cl. 137—108.

McCabe, Francis J., to Air Balance Inc. Fire damper. 3,273,632, 9–20–66, Cl. 160—1.

McCabe-Powers Body Co.: *See*—
Balogh, Roy O., and Bakula. 3,273,466.

McCallum, Davis L. Apparatus and method for making three-dimensional contoured articles. 3,273,461, 9–20–66, Cl. 90—13.1.

McClelland, Etheridge R.: *See*—
Petersen, Carl T., and McClelland. 3,273,692.

McClemens, Samuel W., to Bethlehem Steel Corp. Wire polisher. 3,273,190, 9–20–66, Cl. 15—104.4.

McColl, John C., to Rubbarite Ltd. Sealing. 3,273,743, 9–20–66, Cl. 220—46.

McCollum, Burton (deceased, by Bank of The Southwest National Assn., executors), and P. R. Rowe. Means and method of distinguishing seismic signals. 3,274,543, 9–20–66, Cl. 340—15.5.

McCollum, Burton (deceased, by Bank of The Southwest National Assn., executors), and P. R. Rowe. Method of distinguishing seismic signals. 3,274,544, 9–20–66, Cl. 340—15.5.

McCready, Raymond G., to Carrier Corp. Refrigeration system defrost control. 3,273,352, 9–20–66, Cl. 62—155.

McCurdy, Dean K.: *See*—
Priest, Reid G., and McCurdy. 3,273,722.

McDonald David I., to The Cincinnati Milling Machine Co. Feed control device to feed tool spindle at rate of tool advance. 3,273,182, 9–20–66, Cl. 10—139.

McDonald, Edwin C., and F. E. Stephens, to Republic Steel Corp. Gas mixing method and apparatus. 3,273,982, 9–20–66, Cl. 48—180.

McDowell, William A. Electrically operated cutter for cutting the armor of armored cable. 3,273,236, 9–20–66, Cl. 30—90.5.

McFarland, Glen W. Vacuum bulk cargo unloading system for ships. 3,273,942, 9–20–66, Cl. 302—17.

McFarlin, Stanley B., to The Gorman-Rupp Co. Method and apparatus for separating fluids. 3,273,545, 9–20–66, Cl. 123—41.47.

McGirr, Robert, and B. A. Gay, to Atlas Chemical Industries, Inc. Electrical switch having deformable contact members. 3,274,363, 9–20–66, Cl. 200—142.

McGraw-Edison Co.: *See*—
Harling, Donald W. 3,274,392.
Reber, Hubert. 3,274,320.
Riebs, Richard E. 3,274,359.
Williman, Philip E. 3,273,267.

McGrogan, Ellwood P., Jr., to Radio Corp. of America. Storage circuit. 3,274,566, 9–20–66, Cl. 340—173.

McHale, Joseph P.: *See*—
Buechting, Karl E., and McHale. 3,273,724.

McHugh, Kenneth L.: *See*—
Wilson, Glenn R., McHugh, and Smith. 3,274,107.

McKinnis, Charles L., to Owens-Corning Fiberglas Corp. Borosilicate glass melting method. 3,274,006, 9–20–66, Cl. 106—50.

McLanty, Frank W. Rotary wing aircraft. 3,273,653, 9–20–66, Cl. 170—135.2.

McLarty, Frank W. Pennant and steamer display assemblies. 3,273,273, 9–20–66, Cl. 40—128.

McLeod, Paul C., Jr.: *See*—
Testerman, Maurice K., and McLeod. 3,273,877.

McMahan, Roy F., Jr. to American Metal Products Co. Pedestal bases. 3,273,842, 9–20–66, Cl. 248—148.7.

McMinn, Curtis J., to Reynolds Metal Co. Cathode construction for aluminum production. 3,274,093, 9–20–66, Cl. 204—243.

McNeil Laboratories, Inc.: *See*—
Mohrbacher, Richard J. 3,274,202.

Nickle, Alexander G.: *See*—
Braunwarth, Victor A., Nickle, and Phillips. 3,274,008.

Nickola, Richard A., and G. T. Spare, to United States Steel Corp. Method and apparatus for applying hot-dipped metal coating to wire. 3,274,027, 9–20–66, Cl. 117—114.

Nieper, Hans A., and G. Escherich, to Marbert-Kosmetik, Roeber and Sendler, Firma. Cosmetic cream. 3,274,063, 9–20–66, Cl. 167—91.

Nihon Genshiryoku Kenkyu Sho: *See*—
Amano, Noboru, and Wakayama. 3,274,381.

Nippon Electric Co., Ltd.: *See*—
Oshiba, Jun, Umeda, and Kaneko. 3,273,684.

Nishida, Minoru: *See*—
Sada, Tomohiko, and Nishida. 3,274,111.

Nitto Electric Industries Co., Ltd.: *See*—
Nakajima, Jitsuji, Hayahi, and Onishi. 3,273,772.

Nixon, Charles E., to Inso Electronic Products, Inc. Methods and apparatus for insulating conductors. 3,274,037, 9–20–66, Cl. 156—52.

Noe, Robert J., M. J. Libeer, and J. M. Nys, to Gevaert Photo-Producten N.V. Electrophotographic material and method. 3,274,000, 9–20–66, Cl. 96—1.

Noller, Hans G., and W. G. Bachler, to Leybold Holding Aktiengesellschaft. High-vacuum system, method and apparatus. 3,273,787, 9–20–66, Cl. 230—101.

Nolting, Ray E. Golf putter sighting attachment. 3,273,892, 9–20–66, Cl. 273—163.

Nordberg Mfg. Co.: *See*—
Balmer, Hansjorg, and Gasparac. 3,273,808.
Gasparac, Rudolph J., Szaj, and Turnwald. 3,273,810.

Norfin, Inc.: *See*—
Pearson, Bernard A. 3,273,882.

Norman, George R., and W. M. Le Suer, to The Lubrizol Corp. Barium-cadmium organic complexes as stabilizers for halogen-containing resins. 3,274,135, 9–20–66, Cl. 260—23.

North American Aviation, Inc.: *See*—
Randall, Grant M., Algeo. 3,274,602.

North American Philips Co., Inc.: *See*—
De Ronde, Frans C. 3,274,504.
Neckenburger, Ernst. 3,274,516.
Van Kessel, Theodorus J., and Uljen. 3,274,492.
Weimer, Karl R. U., and Vlaardingerbroek. 3,274,507.
Zukowski, Kurt. 3,273,986.

North, Edwin W., and R. L. Dauenbaugh, to National Lock Co. Combination changing dial, knob and escutcheon assembly. 3,273,363, 9–20–66, Cl. 70—330.

Northern Electric Co. Ltd.: *See*—
Bellem, Edward. 3,274,495.

Northrup, Joseph D.: *See*—
Miles, Marshall, Northrup, and Prell. 3,273,505.

Norton Co.: *See*—
Nelson, Roy S. 3,273,984.

Norton, Desmond H., and M. A. Hardin. Fish lure holder. 3,273,279, 9–20–66, Cl. 43—54.5.

Nourse, Oswald, to National Research Development Corp. Microwave phase shifter. 3,274,521, 9–20–66, Cl. 333—24.1.

Novak, Thomas A., to The W. J. Schoenberger Co. Gas flow-control valve. 3,273,595, 9–20–66, Cl. 137—637.4.

Nyberg, George J., to Riley Stoker Corp. Furnace door. 3,273,521, 9–20–66, Cl. 110—179.

Nyquist, Arthur S., to American Cyanamid Co. Coated plastic articles. 3,274,026, 9–20–66, Cl. 117—138.8.

Nys, Jean M.: *See*—
Noe, Robert J., Libeer, and Nys. 3,274,000.

Oberg, Per O., to Handelsaktiebolaget Sanera. Garbage container structure, in particular for garbage chute. 3,273,840, 9–20–66, Cl. 248—98.

Oberholtzer, Alton V.: *See*—
La Vine, Paul F. 3,274,019.

Oberlander, Georg: *See*—
Oestreicher, Georg, and Oberlander. 3,273,515.

Oberle, Theodore L., M. R. Calton, C. D. Loyd, and C. F. White, to Caterpillar Tractor Co. Method of bonding metal workpieces. 3,273,233, 9–20–66, Cl. 29—470.3.

Ocorn Engineering Co.: *See*—
Morris, Earl L., and Curtice. 3,273,173.

Odenweller, Joseph D., to Ethyl Corp. Hydroxybensyl thioethers and method of preparation. 3,274,258, 9–20–66, Cl. 260—609.

Oertel, Gunther, O. Bayer, and G. Braun, to Farbenfabriken Bayer Aktiengesellschaft. Phosphorus polyurethane plastics prepared from hydroxyl phosphorus compounds. 3,274,130, 9–20–66, Cl. 260—2.5.

Oestreicher, Georg, and G. Oberlander, to Klockner-Humboldt-Deutz Aktiengesellschaft. Locomotive with a main and an auxillary driving machine. 3,273,515, 9–20–66, Cl. 105—96.2.

Ogier, Clayton E.: *See*—
Hudson, Jimmie E., and Ogier. 3,274,314.

O'Hara, Mark J., to Universal Oil Products Co. Process of preparing a silica-alumina supported Group VIII metal hydrocracking catalyst. 3,274,124, 9–20–66, Cl. 252—451.

Okaya, Akira, to International Business Machines Corp. Resonator for radiation generated by stimulated emission. 3,274,512, 9–20–66, Cl. 331—94.5.

Okinaka, Yutaka, and D. R. Turner, to Bell Telephone Laboratories, Inc. Manufacture of nickel electrodes. 3,274,028, 9–20–66, Cl. 136—29.

Olich, Eugene E.: *See*—
Greebler, Paul, Horst, Olich, and Wolfe. 3,274,067.

Pearce, John P., to K.G.M. Electronics Ltd. Selectively illuminated indicating devices. 3,273,274, 9–20–66, Cl. 40—130.

Pearlson, Wilbur H., to Minnesota Mining and Mfg. Co. Electrochemical process for making fluorine-containing carbon compounds. 3,274,081, 9–20–66, Cl. 204—59.

Pearson, Bernard A., to Norfin, Inc. Sheet collating device. 3,273,882, 9–20–66, Cl. 270—58.

Pease, David H., Jr., to Pease Woodwork Co., Inc. Sill and threshold assembly. 3,273,287, 9–20–66, Cl. 49—468.

Pease Woodwork Co., Inc.: *See*—
Pease, David H., Jr. 3,273,287.

Peck, Norman O.: *See*—
Riethmann, Ray E., Grout, N. O. Peck, and W. H. Peck, Sr. 3,273,718.

Peck, William H., Sr.: *See*—
Riethmann, Ray E., Grout, N. O. Peck, and W. H. Peck, Sr. 3,273,718.

Peel, James R. Conductive footwear. 3,274,442, 9–20–66, Cl. 317—2.

Peeters, Jean M., to Pittsburgh Plate Glass Co. Glass drawing apparatus with pivotal cooler. 3,273,990, 9–20–66, Cl. 65—202.

Pek Labs, Inc.: *See*—
Paquette, Raymond E., and Keller. 3,274,427.

Pendleton, Wesley W., and H. L. Saums, to Anaconda Wire & Cable Co. Method of making electromagnetic structures for high-temperature service. 3,273,225, 9–20–66, Cl. 29—155.57.

Pennington, James A. Rotating shaft seal. 3,273,906, 9–20–66, Cl. 277—134.

Pennsalt Chemicals Corp.: *See*—
Albert, Harry E., and Haines. 3,274,252.

Pera, John D.: *See*—
Buckman, Stanley J., Pera, and Purcell. 3,274,050.

Perkins, Cornelius C.: *See*—
Hallman, Henry R., Sichel, Perkins, and Pesely. 3,274,561.

Perlaky, Charles: *See*—
Albright, Denton M., and Perlaky. 3,274,262.

Permaduc, Inc.: *See*—
Peterson, Earl C. 3,273,371.

Permawick Co.: *See*—
Abel, Martin L. 3,273,668.

Perry, Kenneth P., W. J. Jackson, Jr., and J. R. Caldwell, to Eastman Kodak Co. Chlorinated polycarbonates. 3,274,156, 9–20–66, Cl. 260—47.

Perry, Thomas E.: *See*—
Garmy, Robert J., and Perry. 3,273,212.

Pessok, Stanley, to General Instruments Corp. Contact for solid state diode. 3,274,455, 9–20–66, Cl. 317—234.

Pessok, Stanley, to General Instruments Corp. Controlled rectifier comprising a resistive plating interconnecting adjacent N and P layers. 3,274,460, 9–20–66, Cl. 317—235.

Pet Milk Co.: *See*—
Sargeant, Ralph G. 3,273,629.

Petersen, Carl T., to Filper Corp. Freestone drupe pitter. 3,273,616, 9–20–66, Cl. 146—28.

Petersen, Carl T., and E. R. McClelland, to Filper Corp. Freestone drupe pitter and method. 3,273,692, 9–20–66, Cl. 198—34.

Peterson, Dale L., to Varian Associates. Voltage-tunable magnetron. 3,274,432, 9–20–66, Cl. 315—39.63.

Peterson, Dale L., to Varian Associates. Magnetron and radio frequency circuitry therefor. 3,274,433, 9–20–66, Cl. 315—39.73.

Peterson, Earl C., to Permaduc, Inc. Fabricating table. 3,273,371, 9–20–66, Cl. 72—218.

Peterson, Herbert L., and W. J. Finney. Digital differentiator for amplitude modulated carrier. 3,274,503, 9–20–66, Cl. 329—104.

Petit, Elwood P., to Combustion Engineering Inc. Furnace wall blower improvement. 3,273,543, 9–20–66, Cl. 122—392.

Petriello, John, to Dilectrix Corp. High impermeability coatings and supported fabricated objects of polytetrafluoroethylene. 3,274,323, 9–20–66, Cl. 264—308.

Petrocarbon Developments Ltd.: *See*—
Seddon, William L. 3,274,254.

Petro-Tex Chemical Corp.: *See*—
Bajars, Laimonis. 3,274,285.
Brill, William F., and Besozzi. 3,274,255.
Etherington, Robert W., Jr., and Brill. 3,274,242.
Karkalits, Olin C., Jr., and Leatherwood. 3,274,284.

Peugh, James A.: *See*—
Abbott, Frank R., and Peugh. 3,274,536.

Peverley, Guy D., to Intermountain Research & Development Corp. Process for the preparation of soda ash. 3,273,958, 9–20–66, Cl. 23—63.

Pesely, Stanley J.: *See*—
Hallman, Henry R., Sichel, Perkins, and Pesely. 3,274,561.

Pfaudler Permutit Inc.: *See*—
Brown, William R. 3,273,390.

Philco Corp.: *See*—
Pietrolewicz, John P. 3,274,336.
Sikina, Thomas V. 3,274,453.
Sirgo, Valdeko H. 3,273,969.

Phillips, George D.: *See*—
Phillips, James T. and G. D. 3,273,620.

Phillips, Harry: *See*—
Boothroyd, Harold W., and Phillips. 3,273,531.

Phillips, James T. and G. D. Tire chains. 3,273,620, 9–20–66, Cl. 152—228.

Phillips, Norman W. F.: *See*—
Braunwarth, Victor A., Nickle, and Phillips. 3,274,008.

Phillips Petroleum Co.: *See*—
Adams, Loyd W. 3,274,103.
Braseli, Douglass L., Greenfield, and Barber. 3,274,102.
Fluegel, Dale A., and Kuntz. 3,273,576.
Hudson, Jimmie E., and Ogier. 3,274,314.
Hutto, John F., Garlington, and Cabbage. 3,274,275.
Testerman, Maurice K., and McLeod. 3,273,877.
Warner, Paul F. 3,274,142.
Zelinski, Robert P., and Strobel. 3,274,147.

Pickles, Joseph, to Ferro Mfg. Corp. Window regulator. 3,273,410, 9–20–66, Cl. 74—90.

Pieper, Gustav, and H. Logemann, to Farbenfabriken Bayer Aktiengesellschaft. Film-forming copolymer emulsion. 3,274,141, 9–20–66, Cl. 260—29.7.

Pietras, Chester M.: *See*—
Crawford, John K., and Pietras. 3,274,378.

Pietrolewicz, John P., to Philco Corp. High voltage circuit. 3,274,336, 9–20–66, Cl. 178—7.5.

Pietsch, Raymond L., to Engineered Products Co. Magnetic catch assembly. 3,273,926, 9–20–66, Cl. 292—251.5.

Pifiiola, Calvin E., to The Unipress Co., Inc. Shirt buck apparatus. 3,273,765, 9–20–66, Cl. 223—57.

Pifiiola, Calvin E., to The Unipress Co., Inc. Shirt buck apparatus. 3,273,766, 9–20–66, Cl. 223—57.

Pinel, Jacques, and G. Mourier, to C S F Compagnie General de Telegraphie Sans Fil. Particle accelerator. 3,274,502, 9–20–66, Cl. 328—234.

Pinnes, Robert W., to United States of America, Army, and Administrator of the Federal Aviation Agency. Movable turbine-fan unit for an aircraft jet engine. 3,273,654, 9–20–66, Cl. 170—135.7.

Pioch, Werner, to Fernseh G.m.b.H. Electrical apparatus comprising printed circuit boards. 3,274,449, 9–20–66, Cl. 317—101.

Pittler, Marvin S., and J. Chu, to General Instruments Corp. Rectifier assembly and method of making same. 3,274,456, 9–20–66, Cl. 317—234.

Pittsburgh Plate Glass Co.: *See*—
Lacasse, Adrien R. 3,273,812.
Peeters, Jean M. 3,273,990.
Small, Russell L., and Drummond. 3,273,985.

Pittsburgh Plate Glass Co.: *See*—
Umbel, Forrest K. 3,274,390.

Plamowski, Stanley C.: *See*—
Saltzman, Edwin J., De Geer, and Plamowski. 3,273,399.

Plath, Walter L. Spring actuated safety switch for the fuel supply linkage of an internal combustion engine. 3,273,552, 9–20–66, Cl. 123—198.

Plessey-U.K. Ltd.: *See*—
Jamieson, Archie W. H. 3,273,506.

Ploeger, Walter, Jr., to Filmon Process Corp. Impression ribbon and method of making same. 3,273,686, 9–20–66, Cl. 197—172.

Ploeger, Walter, Jr., to Filmon Process Corp. Method of making printing ribbon. 3,274,039, 9–20–66, Cl. 156—251.

Pneumafil Corp.: *See*—
Nagel, Ernst, and Steinmetz. 3,273,408.

Pneumatiques et Caoutchouc Manufacture Kleber-Calombes: *See*—
Paul, Francis V. F. 3,273,978.

Poelstra, William G.: *See*—
Brous, Jack, Conrad, and Poelstra. 3,273,226.

Pohler, Carl L., and R. Breuer, to Th. Kieserling & Abbrett. Straightening machine. 3,273,364, 9–20–66, Cl. 72—12.

Pokrant, Adolf G.: *See*—
Robinson, William A., Jr., and Pokrant. 3,274,384.

Polderman, Robert W.: *See*—
Curtenius, Frederick B., and Polderman. 3,273,725.

Pollitzer, Ernest L., to Universal Oil Products Co. Removal of reaction products of water, boron fluoride, etc. from hydrocarbons. 3,274,279, 9–20–66, Cl. 260—674.

Polymer Corp., The: *See*—
Davis, William J. 3,273,977.
Davis, William J. 3,274,328.
Hanley, Michael A. 3,273,205.

Pool, Eldert B., J. R. Kertis, and J. A. Hollingsworth, to Rockwell Mfg. Co. Composite metal-rubber insert for gate valve. 3,273,853, 9–20–66, Cl. 251—175.

Porter, James A.: *See*—
Deubler, Louis H., Porter, and Thomas. 3,273,592.

Porter, Virgil V., to Moore Business Forms, Inc. Envelope assemblies. 3,273,784, 9–20–66, Cl. 229—69.

Poss, Eliass, to Electronic Energy Conversion Corp. Converter circuit. 3,274,475, 9–20–66, Cl. 320—1.

Potts, James E., to Union Carbide Corp. Irradiated rubbery elastomeric ethylene-alkyl acrylate interpolymers. 3,274,086, 9–20–66, Cl. 204—154.

Poudrier, George L., to United States of America, Navy. Production of cooled propellant gases through endothermic reaction. 3,273,332, 9–20–66, Cl. 60—35.4.

Powell, Jeff R., Jr.: *See*—
Hamaker, Paul, Morgan, and Powell. 3,273,695.

Power Engineering, Inc.: *See*—
Dow, Ronald C. 3,274,474.

Powers, Eugene L.: *See*—
Saunders, James H., and Powers. 3,274,225.

Prager, Roger H., to United States of America, Navy. Display simulator for computer-aided systems. 3,274,557, 9–20–66, Cl. 340—172.5.

Pratt, Albert S.: *See*—
Ede, John H., Pratt, and Sewell. 3,273,450.

Prell, Edward T.: *See*—
Miles, Marshall, Northrup, and Prell. 3,273,505.

Press, Carl, to Alfred Teves Maschinen- und Armaturen Fabrik KG. Internal-expansion brake system with reinforced brake-shoe extensions. 3,273,677, 9–20–66, Cl. 188—78.

Price, James W.: *See*—
Knudsen, Raymond G., Price, and Olson. 3,273,480.

Pricenski, Theodore J.: *See*—
Matheson, Wilfrid G., Clune, and Pricenski. 3,274,374.

Priebs, Horst, to Anker-Werke Aktiengesellschaft. Memory and control device for computing machines or the like. 3,274,349, 9–20–66, Cl. 200—5.

Priest, Reid G., and D. K. McCurdy. Tower top for logging spar. 3,273,722, 9–20–66, Cl. 212—70.

Priscu, John C., and L. E. Snyder, to Titanium Metals Corp. of America. Gettering device. 3,273,970, 9–20–66, Cl. 23—277.

Pritchard, Vern T.: *See*—
Moore, Joseph A. 3,273,730.

Pritchell & Gold and E.P.S. Co. Ltd.: *See*—
Clegg, Joseph. 3,274,319.

Prochaska, Robert J., to General Electric Co. Aromatic carbonates. 3,274,214, 9–20–66, Cl. 260—340.2.

Procter & Gamble Co., The: *See*—
Watrous, Howard N., and Hood. 3,273,300.

Proell, Wayne A., to Standard Oil Co. High-temperature illuminating flare. 3,273,499, 9–20–66, Cl. 102—37.8.

Progil: *See*—
Schneider, Gerard. 3,274,121.

Prohofsky, Le Roy A.: *See*—
Eddy, Charles W., and Prohofsky. 3,274,520.

Prusak, Donald F., and T. E. Crawford, to Dowsmith Inc. Rotating dispensing apparatus. 3,273,814, 9–20–66, Cl. 242—55.

Pudelko, Hermann, to Durkoppwerke Aktiengesellschaft. Buttonhole-stitching machine and thread-severing means therefor. 3,273,523, 9–20–66, Cl. 112—65.

Pullen, Keats A., Jr. Structural configuration for field-effect and junction transistors. 3,274,462, 9–20–66, Cl. 317—235.

Pullman Inc.: *See*—
Gaschke, Marcel M., and Spector. 3,274,049.
Saware, Michael M. 3,274,127.

Purcell, William O.: *See*—
Harmon, George L., and Purcell. 3,274,552.

Purcell, William P.: *See*—
Buckman, Stanley J., Pera, and Purcell. 3,274,050.

Purdy Machinery Co. Ltd.: *See*—
Silver, Dennis S. 3,273,885.

Putley, Ernest H., to National Research Development Corp. Infra-red detector comprising a cooled semiconductor disposed in a magnetic field. 3,274,387, 9–20–66, Cl. 250—83.3.

Puttfarcken, Heinrich, to Junkers & Co. G.m.b.H. Interrelated gas valve and manual igniter control. 3,273,628, 9–20–66, Cl. 158—115.

Pyrochem Corp.: *See*—
Huntington, Morgan G. 3,273,640.

Quenot, Andre, to Etablissements Quenot & Cie. Tape reel. 3,273,820, 9–20–66, Cl. 242—84.8.

Querengasser, Hugo: *See*—
Ritter, Friedbert, Rodis, Reuter, and Querengasser. 3,273,965.

Quick, Harry C., Jr.: *See*—
Mulligan, Robert J., and Quick. 3,274,491.

Quenot & Cie, Etablissements: *See*—
Quenot, Andre. 3,273,820.

Quigley, Mark F. Electrical connector with pre-applied solder. 3,274,331, 9–20–66, Cl. 174—94.

Quinn, Harold W., to The Dow Chemical Co. Removal of acetylenes from gaseous streams with silver carboxylate ion exchange resin. 3,273,314, 9–20–66, Cl. 55—63.

Raab, Karl: *See*—
Trumper, Konrad, and Raab. 3,273,516.

Raabe, Herbert P., to United States of America, Navy. Blistered skin passive satellite. 3,274,596, 9–20–66, Cl. 343—18.

Rademachers, Jakob: *See*—
Zirngibl, Hans, and Rademachers. 3,273,812.

Radio Corp. of America: *See*—
Budnick, Alfred S. 3,273,979.
Eichenbaum, Arie L. 3,274,404.
Fatuzzo, Ennio. 3,274,567.

Riegel Textile Corp.: *See*—
Gore, Graves T., Martin, and Smith. 3,273,522.

Rieger, Frederic L., and P. H. Hamisch, Jr., to The Monarch Marking System Co. Fastener. 3,273,705, 9–20–66, Cl. 206—56.

Riethmann, Ray E., J. R. Grout, N. O. Peck, and W. H. Peck, Sr. Heavy-duty centrifugal separators. 3,273,718, 9–20–66, Cl. 210—370.

Rietz Mfg. Co.: *See*—
Johnson, Frank E., and Lewis. 3,273,257.

Rigterink, Preston D., and R. A. Haggard, to Big Dutchman, Inc. Bin and chain feed system. 3,273,759, 9–20–66, Cl. 222—202.

Riley Stoker Corp.: *See*—
Griffith, Louis E. 3,273,542.
Nyberg, George J. 3,273,521.

Rimmer, Ronald, to Bristol Siddeley Engines Ltd. Jet engine shock wave control system including fuel supply and exhaust nozzle regulation. 3,273,338, 9–20–66, Cl. 60—35.6.

Rio Algom Mines Ltd.: *See*—
Campbell, Robert A., Elliott, Fisher, and Opratko. 3,273,972.

Ripart, Guy: *See*—
Denis, Andre. 3,274,485.

Ripert, Roger L., to Velan Engineering Cos. Ball valve construction. 3,273,852, 9–20–66, Cl. 251—171.

Ritchey, James F.: *See*—
Ham, James H., Jr., Hostetler, Ritchey, and Tolman. 3,274,345.

Ritter, Friedbert, F. Rodis, deceased (by H. Rodis, nee Arend, heiress), K. Reuter, and H. Querengasser, to Knapsack Aktiengesellschaft. Process of preparing a burden for use in electrothermal furnaces. 3,273,965, 9–20–66, Cl. 23—223.

River, Dan, Mills, Inc.: *See*—
Smith, Louis W. 3,274,189.

Rizk, Waheeb, to The English Electric Co. Ltd. Turbogenerators. 3,274,395, 9–20–66, Cl. 290—52.

Roberts, Charles G. Stereo sound system. 3,273,662, 9–20–66, Cl. 181—31.

Roberts, Ryland J.: *See*—
Long, Frank, and Roberts. 3,274,226.

Robinson, Alfred A., to The English Electric Co. Ltd. Concentric helical coils with electrically connected crossover points. 3,274,527, 9–20–66, Cl. 336—69.

Robinson, Carl J.: *See*—
Julien, Harry A., and Robinson. 3,273,551.

Robinson, Frederick G. Tamper-proof caps for containers. 3,273,523, 9–20–66, Cl. 113—121.

Robinson, William A., Jr., and A. G. Pokrant, to Westinghouse Air Brake Co. Railway car counter. 3,274,384, 9–20–66, Cl. 246—247.

Robison, Robert S.: *See*—
Becker, Edward J., and Robison. 3,274,237.

Rockwell Mfg. Co.: *See*—
Pool, Eldert B., Kertis, and Hollingsworth. 3,273,853.

Rodis, Hildegard: *See*—
Ritter, Friedbert, Rodis, Reuter, and Querengasser. 3,273,965.

Rodis, Franz: *See*—
Ritter, Friedbert, Rodis, Reuter, and Querengasser. 3,273,965.

Rodriguez, Antonio R., and R. E. Stapleton, to Aerovox Corp. Electric capacitor and method for producing the same. 3,274,468, 9–20–66, Cl. 317—258.

Rogers, Charles E., R. E. Matty, and E. L. Ralston, to The Babcock & Wilcox Co. Regeneration of magnesium bisulphite pulping liquor and absorption of sulphur dioxide during regeneration. 3,273,961, 9–20–66, Cl. 23—131.

Rogers, Dilworth T., and J. C. Munday, to Esso Research and Engineering Co. Process for manufacture of solid compositions comprising asphalt and clay-containing soils. 3,274,016, 9–20–66, Cl. 106—281.

Rogers, Cyril B., and M. R. Doolittle, to Clark Equipment Co. Load handling apparatus. 3,273,727, 9–20–66, Cl. 214—16.

Rohland, William S., to International Business Machines Corp. Pattern recognition by contour sequences. 3,274,551, 9–20–66, Cl. 340—146.3.

Rohm & Haas Co.: *See*—
Hurwitz, Melvin D. 3,274,164.

Rolfe, Robert G.: *See*—
Faulkner, Joseph A., Black, and Rolfe. 3,274,585.

Rolite, Inc.: *See*—
Hagenson, Leo J. 3,273,934.

Roper, Raymond W., to Sundstrand Corp. Oil burner pump unit with air purging means. 3,273,513, 9–20–66, Cl. 103—203.

Rosaen Filter Co., The: *See*—
Rosaen, Nils O. 3,273,715.

Rosaen, Nils O., The Rosaen Filter Co. Fluid filters. 3,273,715, 9–20–66, Cl. 210—90.

Rosch, Francis C., Jr., and C. K. Hines, to Consolidated Electrodynamics Corp. Ball valve having urging means acting normal thereto. 3,273,851, 9–20–66, Cl. 251—124.

Rosema, Thomas J., and H. R. Farwell, to J. A. Black, president of General Research, Inc. Screen stencil frame. 3,273,497, 9–20–66, Cl. 101—128.1.

Rosenstein, Abraham J.: *See*—
Rosenstein, N. and A. J. 3,273,220.

Rosenstein, N. and A. J., to Spunize Co. of America, Inc. Apparatus for the crimping of natural and synthetic textile materials. 3,273,220, 9–20–66, Cl. 28—1.

Ross, Frank A., to The B. F. Goodrich Co. Apparatus for forming plastic sheet material. 3,273,203, 9–20–66, Cl. 18—19.

Ross, Sigmund L. Industrial waste-gas purifier method. 3,273,316, 9–20–66, Cl. 55—90.

Roth, Harold H., to The Dow Chemical Co. Flexible electroluminescent lamp having transparent metal-coated strands as the light transmitting electrode. 3,274,419, 9–20–66, Cl. 313—108.

Roth, James F.: *See*—
Moore, Richard N., and Roth. 3,274,287.

Rothfeder, Arthur L.: *See*—
Halverstadt, Carl D. 3,273,248.

Rotow, Alexander A., to United States of America, Army. Image intensifier type camera tube with potential field correcting means. 3,274,416, 9–20–66, Cl. 313—65.

Rottler, Donald B. Boring machine. 3,273,423, 9–20–66, Cl. 77—4.

Roulund, Poul B., 20% to E. A. Sokolski. Water jet propulsion device. 3,273,333, 9–20–66, Cl. 60—35.5.

Roussel-UCLAF: *See*—
Dube, Jacques. 3,274,176.
Joly, Robert, Warnant, and Goffinet. 3,274,233.

Rowe, P. R.: *See*—
McCollum, Burton, and Rowe. 3,274,544.

Rubbarite Ltd.: *See*—
McColl, John C. 3,273,743.

Rubin, Norman N. Torque limiting nut. 3,273,443, 9–20–66, Cl. 85—61.

Rudeke, Bengt G., to Atlas Copco Aktiebolag. Mechanical nut driving wrench. 3,273,428, 9–20–66, Cl. 81—52.3.

Rüdiger, Ernst. Container for the preparation of bath salts. 3,273,704, 9–20–66, Cl. 206—47.

Rudolph, Hans: *See*—
Raichle, Karl, and Rudolph. 3,274,291.

Ruehle, William H., to Socony Mobil Oil Co. Methods of band-equalizing seismograms. 3,274,542, 9–20–66, Cl. 340—15.5.

Rumanowski, Edmund J.: *See*—
Gilbert, Everett E., and Rumanowski. 3,274,243.

Ruppert, John A., and P. M. Sullivan, to United States of America, Interior. Recovery of zinc from zinc die-cast scrap. 3,273,995, 9–20–66, Cl. 75—63.

Rusinyak, Gregory J.: *See*—
Ebensteiner, Gerald F., and Rusinyak. 3,274,361.

Russell, Gordon D., and E. J. Skiejka, to Johnson & Johnson. Method for producing a decorative nonwoven fabric. 3,274,018, 9–20–66, Cl. 117—11.

Russell, John D., to Conair, Inc. Material transporting device. 3,273,943, 9–20–66, Cl. 302—59.

Rutemiller, Herbert C., and A. M. Montgomery, to Aluminum Co. of America. Galvanic anode. 3,274,085, 9–20–66, Cl. 204—148.

Ryan Aeronautical Co., The: *See*—
Girard, Peter F. 3,273,655.
Girard, Peter F. 3,273,827.
James, Harry A. 3,273,828.
Stanley, Oliver C. 3,274,494.

Ryer, Frederick V.: *See*—
Goldwasser, Seymore, and Ryer. 3,274,119.

Ryerson Haynes, Inc.: *See*—
De Orlow, Stephen. 3,273,429.

Ryno, Robert W., and G. A. Schwibinger, to A. O. Smith Corp. Magnetic card reader. 3,274,352, 9–20–66, Cl. 200—46.

Ryu, Hirosuke: *See*—
Ikeda, Hachiro, Yurimoto, and Ryu. 3,273,996.

SCM Corp.: *See*—
Baronnie, Roger. 3,273,883.
Clark, Clayton H., and Anderson. 3,274,338.

S.S.S. Patents Ltd.: *See*—
Clements, Herbert A. 3,273,412.

Sackler, Mortimer D.: *See*—
Halpern, Alfred, and Sackler. 3,274,053.

Sada, Tomohiko, and M. Nishida, to Sony Corp. Magnetic recording medium with self-contained lubricant. 3,274,111, 9–20–66, Cl. 252—62.5.

Saint-Gobain Compagnie de: *See*—
Jochim, Friedrich. 3,273,933.

Saizon, Floyd S. Device for measuring the unevenness of a surface. 3,273,251, 9–20–66, Cl. 33—174.

Salat, Robert F.: *See*—
Morris, Robert A., and Salat. 3,274,326.

Sallay, Stephen, to American Home Products Corp. 5-aminobenzocarbazoles. 3,274,188, 9–20–66, Cl. 260—247.5.

Salomon, Robert E., to United States of America, Atomic Energy Commission. Photocell with cooling means and method of using same. 3,274,030, 9–20–66, Cl. 136—8.

Saltzman, Edwin J., M. D. De Geer, S. C. Plamowski, and R. G. Green, to United States of America, National Aeronautics and Space Administration. Traversing probe. 3,273,399, 9–20–66, Cl. 73—389.

Salvesen, Robert H., to Esso Research and Engineering Co. Petroleum mulch film. 3,274,138, 9–20–66, Cl. 260—28.5.

Sanders, Carl W.: *See*—
Freeman, John T., and Sanders. 3,274,308.

Sanders, Murray A. Combined electrical connector and indicator. 3,274,587, 9–20–66, Cl. 340—381.

Sandler, Ronald F.: *See*—
Droege, Thomas F., Sandler, and Futterweit. 3,274,589.

San Miguel, Anthony: *See*—
Silver, Robert. 3,273,381.

Santillan, Felipe L. L.: *See*—
Minoza, Clemente. 3,273,983.

Sargeant, Ralph G., to Pet Milk Co. Method and apparatus for removing water from fuel and other oils. 3,273,629, 9–20–66, Cl. 159—3.

Saroyan, John R., and H. D. Dear. Antifouling protective coating compositions. 3,274,137, 9–20–66, Cl. 260—27.

Sauer, Hermann: *See*—
Mönkemeyer, Karl, and Sauer. 3,274,266.

Saums, Harry L.: *See*—
Pendleton, Wesley W., and Saums. 3,273,225.

Saunders, Frederick C., and D. S. Caldwell, to Midland Silicones Ltd. Organosilicon compositions. 3,274,155, 9–20–66, Cl. 260—46.5.

Saunders, James H., and E. L. Powers, to Mobay Chemical Co. Method for producing organic polyisocyanates substantially free of sediment. 3,274,225, 9–20–66, Cl. 260—453.

Saunders, Robert P. Adjusting mechanism for photographic apparatus. 3,273,452, 9–20–66, Cl. 88—24.

Saunders Valve Co. Ltd.: *See*—
Billson, Frederick W. 3,273,902.

Sawatzky, Peter: *See*—
Washkurak, Stephen, and Sawatzky. 3,274,488.

Scantlin Electronics, Inc.: *See*—
Francy, James R. 3,274,355.

Scarano, Louis: *See*—
Wilbert, Godfrey, Scarano, and Duesel. 3,274,206.

Scardiglia, Frank: *See*—
Goldberg, Eugene P., and Scardiglia. 3,274,290.

Himelreich, Louis E., and Dillen. 3,273,952.

Schelleng, Robert D.: *See*—
Knoth, Roy J., Schelleng, and Isleib. 3,273,998.

Schering Aktiengesellschaft: *See*—
Muller, Karl H., and Borner. 3,274,271.

Schindler, Herbert. Grippers for a heel lasting machine. 3,273,183, 9–20–66 Cl. 12—11.3.

Schlernitzauer, Edward A., to Swift & Co. Ham pumping device. 3,273,487, 9–20–66, Cl. 99—254.

Schloemann Aktiengesellschaft: *See*—
Schwarze, Gerhard, Lemm, Hover, and Wischeropp. 3,273,572.

Schluester Mfg. Co.: *See*—
Kalz, Anthony C. 3,273,747.

Schlumberger Well Surveying Corp.: *See*—
Der Mott, Raymond W. 3,273,645.
Lebourg, Maurice P., and Dewan. 3,273,639.

Schmengler, Johann. Axial shaft seal. 3,273,901, 9–20–66, Cl. 277—92.

Schmerling, Louis, to Universal Oil Products Co. N-alkylation of amides and imides. 3,274,211, 9–20–66, Cl. 260—326.

Schmerling, Louis, to Universal Oil Products Co. Halo-substituted carboxylic acid esters of nitro alkanols. 3,274,236, 9–20–66, Cl. 260—487.

Schmermund, Alfred. Electric impulse storing devices and packaging machines comprising such devices. 3,274,389, 9–20–66, Cl. 250—205.

Schmid, Wolfgang: *See*—
Vöster, Reinhold, and Schmid. 3,273,196.

Schneider, Gerard, to Progil. Trilithium phosphate isomerization catalyst. 3,274,121, 9–20–66, Cl. 252—437.

Schneider, Josef, & Co.: *See*—
Macher, Karl, Solisch, and Woltche. 3,273,457.

Schneider, Kurt R., to Eureka Specialty Printing Co. Sheet feeding apparatus. 3,273,436, 9–20–66, Cl. 83—241.

Schneider, Kurt R., to Eureka-Carlisle Co. Labeling machine. 3,274,043, 9–20–66, Cl. 156—357.

Schneider, Paul, to Farbenfabriken Bayer Aktiengesellschaft. N - phenyl - N - (1,2-dimethylpropyl)-p-phenylenediamines. 3,274,250, 9–20–66, Cl. 260—576.

Schnitzler, Hans F., to Radio Corp. of America. Multilayer circuit connection. 3,274,327, 9–20–66, Cl. 174—68.5.

Schoenberger, W. J., Co., The: *See*—
Novak, Thomas A. 3,273,595.

Scholl, James E., to United States of America, Navy. Thixotropes as braking medium for catapult brake. 3,273,830, 9–20–66, Cl. 244—63.

Schreieck, Walter. Method for producing building elements and especially building stones of sintered material or the like. 3,274,309, 9–20–66, Cl. 264—42.

Schubert, Friedrich: *See*—
Goerrig, Dieter, Schubert, Weise, and Lang. 3,273,955.

Schuff, Richard W. Precision positioning device. 3,273,861, 9–20–66, Cl. 254—189.

Schuler, Dorland H. Grain wagon. 3,273,733, 9–20–66, Cl. 214—519.

Schuler, Dorland H. Feed mixing and blending machine. 3,273,734, 9–20–66, Cl. 214—521.

Schuller, Eduard, to Telefunken Patentverwertungsgesellschaft m.b.H. Tape recorder. 3,273,815, 9–20–66, Cl. 242—55.12.

Schultz, Alfred W., to The Cleveland Crane & Engineering Co. Seal for fluid-operated clutch. 3,273,682, 9–20–66, Cl. 192—85.

Schultz, Eduard H., Jr., to The Nagel-Chase Mfg. Co. Fabricated sheet metal sheave. 3,273,411, 9–20–66, Cl. 74—230.4.

Schultz, Elmer M.: *See*—
Hyde, James F., and Schultz. 3,274,153.

Schuman, Leslie N., to Midland-Ross Corp. Apparatus for finish-shaping sprockets. 3,273,366, 9–20–66, Cl. 72—69.

Schwarz, Frank, to Barnes Engineering Co. Automatic ambient temperature compensation for a medical thermometer. 3,273,395, 9–20–66, Cl. 73—355.

Schwarze, Gerhard, H.-P. Lemm, H. Hover, and O. Wischeropp, to Schloemann Aktiengesellschaft. Continuous cooling of metal slabs and the like in a water bath. 3,273,572, 9–20–66, Cl. 134—104.

Schwibinger, Gilbert A.: *See*—
Ryno, Robert W., and Schwibinger. 3,274,352.

Sciaky, David, to Welding Research, Inc. Filament for electron gun. 3,274,425, 9–20–66, Cl. 313—237.

Scoledge, Robert F., and R. P. Bonazoli, to Sylvania Electric Products Inc. Electric lamp with fuse. 3,274,426, 9–20–66, Cl. 313—318.

Scott, Earl H., to Bethlehem Steel Corp. Saw clamp attachment. 3,273,437, 9–20–66, Cl. 83—444.

Scott, Morton W.: *See*—
Johnston, Gene W., Malani, and Scott. 3,274,061.

Scovill Mfg. Co.: *See*—
Taylor, Donald O. 3,273,229.

Scragg, Ernest, & Sons Ltd.: *See*—
Scragg, Frederick. 3,273,329.

Scragg, Frederick, to Ernest Scragg & Sons Ltd. Textile yarns. 3,273,329, 9–20–66, Cl. 57—140.

Scudder, John A., to Chemechanical, Inc. Method of flow forming polyurethane and the like material. 3,274,322, 9–20–66, Cl. 264—213.

Scully-Anthony Corp.: *See*—
Daiedsic, Harry R., and Jerue. 3,273,235.

Shimada, Mitsuo: *See*—
Yoshida, Kasumi, and Shimada. 3,273,512.

Shina, Frank C., to United Board & Carton Corp. Pallet. 3,273,518, 9–20–66, Cl. 108—55.

Shomo, Ernest S.: *See*—
Shomo, Robert D. 3,273,755.

Shomo, Robert D., 33⅓ to E. S. Shomo, and 33⅓ to C. R. Boyd. Self-dumping bucket with brake. 3,273,755, 9–20–66, Cl. 222—166.

Short, James H., to Abbott Laboratories. Substituted tetrahydrofurans. 3,274,218, 9–20–66, Cl. 260—347.7.

Short, Thomas A., Co.: *See*—
Hasund, John. 3,273,432.

Short, Thomas W. Method of forming concrete roofs. 3,274,305, 9–20–66, Cl. 264—31.

Shortridge, William K., to General Dynamics Corp. Electrical connector. 3,274,534, 9–20–66, Cl. 339—196.

Shrensel, Julius, to Allied Chemical Corp. Distributor plate. 3,273,200, 9–20–66, Cl. 18—8.

Shuford, Lloyd N., and C. B. Messer III, to Simplimatic Engineering Co. Object separating apparatus. 3,273,708, 9–20–66, Cl. 209—74.

Shurts, Lawrence R. Garden tool for removing weeds. 3,273,929, 9–20–66, Cl. 294—50.

Siberini, Alfred W. Adjustable T-square. 3,273,246, 9–20–66, Cl. 33—101.

Sichel, Leonard H., Jr.: *See*—
Hopper, Warren W., Pezely, Sichel, Lounsbury, and Zimmerman. 3,274,554.
Hallman, Henry R., Sichel, Perkins, and Pezely. 3,274,561.

Siebold, Donald J., to General Electric Co. Insulative spacer for television chassis. 3,274,450, 9–20–66, Cl. 317—101.

Siegener Maschinenbau G.m.b.H.: *See*—
Mödder, Otto. 3,273,369.

Siegmund, Walter P., to American Optical Co. Fiber optical face plates having different numerical aperture values in two different directions. 3,273,445, 9–20–66, Cl. 88—1.

Sierra Electric Corp.: *See*—
Bourhenne, Francis K. 3,274,531.

Sievers, Augustin: *See*—
Kaufmann, Karl, and Sievers. 3,273,455.

Sigal, Max V., Jr., P. Marchini, and B. L. Poet, to The S. E. Massengill Co. Phthalazine derivatives. 3,274,185, 9–20–66, Cl. 260—240.

Sikina, Thomas V., to Philco Corp. Semiconductor integrated structures and methods for the fabrication thereof. 3,274,453, 9–20–66, Cl. 317—234.

Silber, Maurice. Automatic telephone dialing apparatus. 3,274,346, 9–20–66, Cl. 179—90.

Silver, Dennis S., to Purdy Machinery Co. Ltd. Mechanism for separating sheets of flexible material from a pack or stack thereof. 3,273,885, 9–20–66, Cl. 271—27.

Silverberg, Morton, to Radio Corp. of America. Logic circuits. 3,274,398, 9–20–66, Cl. 307—88.5.

Simplimatic Engineering Co.: *See*—
Shuford, Lloyd N., and Messer. 3,273,708.

Simpson, Richard W., to V-M Corp. Adapter spindle for record changers. 3,273,895, 9–20–66, Cl. 274—10.

Sims, Wendel J. Roofing felt-laying machine. 3,273,533, 9–20–66, Cl. 118—235.

Singer Co., The: *See*—
Hughes, Ralph. 3,273,424.
Mahler, Peter A. 3,273,360.

Sipler, Harry, to United States of America. Army. Torque transducer utilizing a magnetized shaft having a surface discontinuity reference mark. 3,273,386, 9–20–66, Cl. 73—136.

Sirgo, Valdeko H., to Philco Corp. Apparatus for growing fluoride crystals. 3,273,969, 9–20–66, Cl. 23—273.

Sivilotti, Olivo G., to Aluminium Laboratories Ltd. Foil rolling apparatus. 3,273,819, 9–20–66, Cl. 242—78.1.

Skiatron Electronics & Television Corp.: *See*—
Shanahan, William J. 3,274,333.

Skidmore, Frank O., to D. Gottwald. Resiliently-mounted wheel balancing weights. 3,273,941, 9–20–66, Cl. 301—5.

Skiejka, Edmund J.: *See*—
Russell, Gordon D., and Skiejka. 3,274,018.

Skogman, John: *See*—
Miller, Mary L., and Skogman. 3,274,168.

Skoog, Per O. Method and means for patching assembled plywood panels. 3,273,614, 9–20–66, Cl. 144—310.

Skrobisch, Alfred, to Allard Instrument Corp. Segmented exhibitor. 3,273,270, 9–20–66, Cl. 40—52.

Slattery, John P., to General Electric Co. Two-speed induction motor. 3,274,472, 9–20–66, Cl. 318—200.

Sloan, Francis J., to Union Carbide Corp. Locally deformed and locally delaminated scores and the method and apparatus for making same. 3,274,047, 9–20–66, Cl. 161—46.

Sloan Valve Co.: *See*—
Billeter, Henry R., and Nelson. 3,273,919.

Small, Russell L., and W. W. Drummond, to Pittsburgh Plate Glass Co. Production of fiber glass strand. 3,273,985, 9–20–66, Cl. 65—2.

Smidt, Jürgen: *See*—
Kojer, Hugo, Jira, Smidt, and Stangl. 3,274,238.

Smiens, Leon D., to Archer-Daniels-Midland Co. Freeze-thaw stabilizers for quaternary ammonium compounds. 3,274,106, 9–20–66, Cl. 252—8.75.

Smiltneek, Raymond J., to Logemann Bros. Co. Apparatus for processing scrap material. 3,273,493, 9–20–66, Cl. 100—93.

Smith, A. O., Corp.: *See*—
Johnson, Irving A., and Stasenko. 3,273,753.
Ryno, Robert W., and Schwibinger. 3,274,352.

Smith, Bernard G., to General Motors Corp. Clothes washer machine with a programmed rebalancing cycle. 3,273,361, 9–20–66, Cl. 68—12.

Smith, Edward H.: *See*—
Tanczos, Frank I., Davis, and Smith. 3,273,334.

Smith, Edward P.: *See*—
Adriance, Theodore R., Jr., and Smith. 3,274,413.

Smith, Irving. Decorative dining napkins. 3,274,045, 9–20–66, Cl. 161—7.

Smith, James L.: *See*—
Harrington, Robert C., Jr., and Smith. 3,274,014.
Bobeck, Andrew H., and Smith. 3,274,571.

Smith, John O.: *See*—
Wilson, Glenn R., McHugh, and Smith. 3,274,107.

Smith Kline & French Laboratories: *See*—
Julian, Percy L., and Magnani. 3,274,178.

Smith, Louis W., to Dan River Mills, Inc. Novel compositions for treating textiles and process for making same utilizing phosphoric acid. 3,274,189, 9–20–66, Cl. 260—248.

Smith, Lucius D.: *See*—
Granito, Gerry D., Smith, Spencer, and Stafford. 3,274,560.

Smith, Luke J., Jr., to Milton Bradley Co. Teaching device. 3,273,262, 9–20–66, Cl. 35—33.

Smith, Norman: *See*—
Gore, Graves T., Martin, and Smith. 3,273,522.

Smith, Ralph E., to Cam Corp. Multi-selector unit for an IBM key punch machine. 3,273,792, 9–20–66, Cl. 234—18.

Smith, Traver J.; ¼ to G. L. Magnuson, and ½ to Robert Magnuson and L. J. Fox, trustees of the estate of Roy M. Magnuson. Shuffle feed sorter with sliver ejection. 3,273,711, 9–20–66, Cl. 209—98.

Smitzer, Louis A., to Bell & Howell Co. File card retrieval device. 3,273,566, 9–20–66, Cl. 129—16.1

Smitzer, Louis A., to Bell & Howell Co. File card retrieval device. 3,273,567, 9–20–66, Cl. 129—16.1.

Snap-On Tool Corp.: *See*—
Knudson, Raymond G., Price, and Olson. 3,273,430.

Snavely, Benjamin L., to United States of America, Navy. Electroacoustic transducer. 3,274,538, 9–20–66, Cl. 340—8.

Snelling, Charles D. Self-sustaining temperature-control package. 3,273,634, 9–20–66, Cl. 165—1.

Snow, Henry J.: *See*—
Kleist, Dale, Snow, and Buchanan. 3,273,358.

Snyder, Kenneth E., to General Motors Corp. Torque boosted brake. 3,273,674, 9–20–66, Cl. 188—72.

Snyder, Linden E., to Titanium Metals Corp. of America. Electrolytic production of titanium. 3,274,083, 9–20–66, Cl. 204—64.

Snyder, Linden E.: *See*—
Priscu, John C., and Snyder. 3,273,970.

Wolf, Helmut, to Lohmann K.G. Bandaging material for medical purpose. 3,273,561, 9–20–66, Cl. 128—156.

Wolf, Herman B., to R. H. Bouligny, Inc. Method and means for increasing voltage capability and improving the operation of an electrical transmission system. 3,274,445, 9–20–66, Cl. 317—12.

Wolf, Otto, and T. Moser, to Hofliger & Karg. Apparatus for filling and sealing two-piece capsules and the like. 3,273,309, 9–20–66, Cl. 53—281.

Wolf, Tobin. Articulated head and limbs for dolls and toy animals. 3,273,283, 9–20–66, Cl. 46—161.

Wolfe, Bertram: *See*—
Greebler, Paul, Horst, Olich, and Wolfe. 3,274,067.

Wolfram, George, T. H. Szawlowski, and L. A. Joo, to Union Oil Co. of California. Lubricant compositions containing polyester additives. 3,274,108, 9–20–66, Cl. 252—48.6.

Wolinski, Leon E., to E. I. du Pont de Nemours and Co. Surface treatment of polymeric-shaped structures. 3,274,088, 9–20–66, Cl. 204—165.

Wolinski, Leon E., to E. I. du Pont de Nemours and Co. Surface treatment of polymeric-shaped structures. 3,274,089, 9–20–66, Cl. 204—165.

Wollweber, Hartmund: *See*—
Hiltmann, Rudolf, Wollweber, Hoffmeister, and Wirth. 3,274,187.

Woltche, Walter: *See*—
Macher, Karl, Solisch, and Woltche. 3,273,457.

Wolter, Gilbert R.: *See*—
Jepson, Ivar, Wied, and Wolter. 3,273,194.
Chambers, Worthy L., and Wolter. 3,274,040.

Wood, Ernest C.: *See*—
Brown, Adolph M. 3,273,562.

Wood, John, Co.: *See*—
Faunce, Stuart F. 3,273,741.

Woodward, Stephen G., to The Bendix Corp. Pressure responsive valve having a uniformly progressive and smooth opening characteristic. 3,273,590, 9–20–66, Cl. 137—510.

Word, William W., Jr.: *See*—
Bishop, Robert, Castor, and Walker. 3,273,915.

Worley, Ernest J.: *See*—
Levinson, Louis E., and Worley. 3,273,189.

Wright, James H., to The Bauer Bros. Co. Refiner system. 3,273,807, 9–20–66, Cl. 241—42.

Wright, Paul E., to Radio Corp. of America. Optical-photoconductive reproducer utilizing insulative liquids. 3,274,565, 9–20–66, Cl. 340—173.

Wright, Walter H., to Firth Brown Tools Ltd. Cutting tools. 3,273,223, 9–20–66, Cl. 29—105.

Wyandotte Chemicals Corp.: *See*—
Elfers, Gunther, and Davis. 3,274,163.
Elfers, Gunther, and Davis. 3,274,293.

Wyatt, Richard G.: *See*—
Archer, Alton M., and Wyatt. 3,274,597.

Wynkoop, Raymond, to Sun Oil Co. Preparation of naphthalene-2,6-dicarboxylic acid. 3,274,241, 9–20–66, Cl. 260—515

Xerox Corp.: *See*—
Clark, Harold E. 3,273,999.

Yaffe, Jerome, and R. E. Sellers, to FMC Corp. Preparation of pesticide granules. 3,274,052, 9–20–66, Cl. 167—42.

Yamaguchi, Tadashi: *See*—
Amagasa, Masataka, and Yamaguchi. 3,274,272.

Yamamura, Kazuomi: *See*—
Qurimura, Toshio, and Yamamura. 3,274,479.

Yelloz, Guy R.: *See*—
Herry, Michel J., Le Corre, and Yelloz. 3,274,339.

Yeo, Alan A., and R. T. L. Mowll, to The British Petroleum Co. Ltd. Separation process using molecular sieves. 3,274,100, 9–20–66, Cl. 208—310.

Yoshida, Kasumi, and M. Shimada, to Hitachi, Ltd. Pump device for delivering a minute quantity of fluid. 3,273,512, 9–20–66, Cl. 103—171.

Yoshinaga, Elichi: *See*—
Kado, Masaru, Tsurol, Maeda, and Yoshinaga. 3,274,051.

Young, Charles C. Automatic dialing device. 3,274,344, 9–20–66, Cl. 179—90.

Young, Donald M.: *See*—
Hostettler, Frantz, and Young. 3,274,143.

Young, George B. A., and K. J. Cadman, to Rapid Metal Development Ltd. Joint for use in scaffolding. 3,273,921, 9–20–66, Cl. 287—53.5.

Ytterfors, Sven L., and A. E. Jansson, to Atlas Copco Aktiebolag. Feeding slide arrangement for rock drilling machines or the like. 3,273,658, 9–20–66, Cl. 173—141.

Yurimoto, Juntaro: *See*—
Ikeda, Hachiro, Yurimoto, and Ryu. 3,273,996.

Zahuranec, Emery J., and Z. Szohatzky, to Crawford Fitting Co. End closure assembly. 3,273,742, 9–20–66, Cl. 220—39.

Zahradnik, George J., to A. B. Dick Co. Automatic stop mechanism for arresting manual raising of feed tables. 3,273,884, 9–20–66, Cl. 271—22.

Zajic, James E., and W. J. Dunlap, to Kerr-McGee Oil Industries, Inc. Preparation of salicylic acid by microbiological oxidation of naphthalene in the presence of a boron compound. 3,274,074, 9–20–66, Cl. 195—51.

Zankl, Frank: *See*—
Stobbe, Richard E., and Zankl. 3,273,413.

Zelinski, Robert P., and C. W. Strobel, to Phillips Petroleum Co. Compositions from liquid conjugated diene polymers. 3,274,147, 9–20–66, Cl. 260—41.5.

Zenith Radio Corp.: *See*—
Crumly, Charles B. 3,274,418.

Ziemke, William A., Jr.: *See*—
Chapman, William I., Whitfield, Atwood, and Ziemke. 3,273,903.
Chapman, William I., Whitfield, Atwood, and Ziemke. 3,273,904.
Chapman, William I., Whitfield, Atwood, and Ziemke. 3,273,905.

Zilliken, Frederick W., to American Home Products Corp. Formulations for infant feeding. 3,274,003, 9–20–66, Cl. 99—54.

Zimmerman, Mark S., to General Atronics Corp. Pulse position modulation sweep integrator system. 3,274,497, 9–20–66, Cl. 328—37.

Zimmerman, Patricia V.: *See*—
Hopper, Warren W., Pezely, Sichel, Lounsbury, and Zimmerman. 3,274,554.

Zink, John, Co.: *See*—
Zink, John S., Goodnight, and Reed. 3,273,627.

Zink, John S., H. Goodnight, and R. D. Reed, to John Zink Co. Flare stack burner assembly. 3,273,627, 9–20–66, Cl. 158—99.

Zirngibl, Hans, and J. Rademachers, to Farbenfabriken Bayer Aktiengesellschaft. Process for drying gases which contain hydrogen chloride. 3,273,312, 9–20–66, Cl. 55—31.

Zollinger, Erich: *See*—
Haefer, Rene, and Zollinger. 3,274,417.

Zuckerbraun, Jacob S., to Kollsman Instrument Corp. Single modulation star tracker. 3,274,393, 9–20–66, Cl. 250—233.

Zukowski, Kurt, to North American Philips Co., Inc. Method and device for sealing together glass parts. 3,273,986, 9–20–66, Cl. 65—40.

Zumwalt, Lloyd R., to United States of America, Atomic Energy Commission. Unpurged fuel element. 3,274,066, 9–20–66, Cl. 176—68.

Zurkowski, Edward W., to Electrolux Corp. Replacement or repair strap for extension cord and harness assembly. 3,273,213, 9–20–66, Cl. 24—73.

Zygan, Hieronymus, to Farbenfabriken Bayer Aktiengesellschaft. Apparatus for manufacturing thermoplastic foils with beaded edges. 3,273,202, 9–20–66, Cl. 18—12.

CLASSIFICATION OF PATENTS

ISSUED SEPTEMBER 20, 1966

NOTE.—First number, class; second number, subclass; third number, patent number

2— 3 : 3,273,162
3,273,163
10 : 3,273,164
169 : 3,273,165
185 : 3,273,166
243 : 3,273,167
3— 1 : 3,273,168
12.3 : 3,273,169
4— 72 : 3,273,170
172 : 3,273,171
192 : 3,273,172
252 : 3,273,173
5—327 : 3,273,174
334 : 3,273,175
3,273,176
335 : 3,273,177
353.2 : 3,273,178
354 : 3,273,179
355 : 3,273,180
8— 12 : 3,273,954
34 : 3,273,955
55 : 3,273,956
9— 8 : 3,273,181
10—139 : 3,273,182
12— 11.3 : 3,273,183
16.4 : 3,273,184
142 : 3,273,185
13— 6 : 3,274,324
15— 1.5 : 3,273,186
1.7 : 3,273,187
3,273,188
22 : 3,273,189
104.04: 3,273,190
105 : 3,273,191
230.11: 3,273,192
320 : 3,273,193
323 : 3,273,194
344 : 3,273,195
16— 82 : 3,273,196

U.S. DEPARTMENT OF COMMERCE
OFFICIAL GAZETTE of the UNITED STATES PATENT OFFICE
September 20, 1966 Volume 830 Number 3

TRADEMARKS

NOTICES

United States Adopted Names

List No. 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
descinolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the

CONDITION OF TRADEMARK APPLICATIONS AS OF JULY 31, 1966

Total number of applications awaiting action [excluding renewals and Sec. 12(c)]	28,840
Date of oldest new application	July 15, 1965
Date of oldest amended application (filing date)	July 6, 1962

Renewals Issued 70

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402 to whom all subscriptions should be made payable and all communications addressed; subscription price, $12.00 per annum, foreign mailing $4.00 additional; single copies, 25 cents each.

PRINTED COPIES OF TRADEMARK REGISTRATIONS are furnished by the Patent Office for 20 cents each. Address orders to the Commissioner of Patents, Washington, D.C., 20231.

period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name;* all other names on the list are *proposed for adoption.*

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldezone: antibacterial
*nitarsone: veterinary histomonastat
*nitrazepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic
*prednival: topical anti-inflammatory
*prilocaine hydrochloride: local anesthetic
*propiram fumarate: analgesic
*pyrantel tartrate: anthelmintic
quilazine maleate: oxytocic
*rifamide: antibacterial
*roxarsone: veterinary growth simulant
seperidol hydrochloride: neuroleptic
*sodium ampicillin: antibiotic
*sodium edetate: chelating agent
*sodium ethacrynate: diuretic
sulfabenz: veterinary antibacterial and anticoccidial
sulfafen: antibacterial; anticoccidial agent
*tetramisole hydrochloride: anthelmintic
*tetroquinone: treatment of keloids
thyroglobulin: thyroid preparation
*trimoxamine hydrochloride: antihypertensive
*trisodium edetate: chelating agent
*viridofulvin: antifungal antibiotic
zolertine hydrochloride: vasodilator; anti-adrenergic; anti-hypertensive

Trademark Suits

Notices under 15 U.S.C. 1116; Trademark Act of July 5, 1946

Reg. No. 293,319 (SONOTONER), Sonotone Corporation, Earphones for the use of persons with defective hearing; **Reg. No. 327,079** (SONOTONE), same, Hearing-aid devices and acoustic elements and accessories thereof, such as sound transmitters, telephone receivers, hearing-inducing bone oscillators and electric sound amplifiers; **Reg. No. 344,948,** same, Phonographs and apparatus for recording sound on discs and accessories thereof; **Reg. No. 633,079,** same, Mechano-electric energy transducers—namely, phonograph pick-ups and parts thereof; **Reg. No. 677,971** (SONOTAPE), same, Electro-magnetic transducers, and specifically magnetic tape recording heads; **Reg. No. 763,389** (SONO/COM), same, Mechano-electric transducers—namely, head set microphones and parts thereof; **Reg. No. 767,838** (SONOTROL), Sonotone Corporation, assignee of Aaron H. Axelrod, doing business as Electronics Company, Electronically operated sound switch, particularly useful for the deaf and hard of hearing; **Reg. No. 779,881** (SONO-FLEX), Sonotone Corporation, Replaceable stylus holders and styli for phonograph pickup cartridges; **Reg. No. 792,144** (SONOMASTER), same, Speaker systems, including loudspeakers and enclosures therefor; **Reg. No. 796,672** (SONAFONE), same, Phonograph cartridge assemblies, microphones and parts therefor, hearing aid receivers, hearing aids and parts therefor, **filed** Mar. 17, 1966, D.C.N.J. (Trenton), Doc. 272–66, *Sonotone Corporation* v. *Sonetronics, Incorporated.* Judgment dismissing action with prejudice Aug. 11, 1966.

MARKS PUBLISHED FOR OPPOSITION

SECTION 1

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Application for the registration of these marks in more than one class has been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of this publication. See Rules 2.101 to 2.105.

A separate fee of twenty-five dollars for each class opposed must accompany the opposition.

[NOTE: For publication of marks presented in applications for registration in one class, see section 2.]

SN 192,932. N.V. Instrument Fabriek En-Handel Voorheen P. J. Kipp & Zonen, Delft, Netherlands. Filed May 7, 1964.

KIPP & ZONEN

Owner of Dutch Reg. No. 148,063, dated Oct. 31, 1962.

Class 26—Measuring and Scientific Appliances

For Galvanometers, Microvolmeters, Apparatus for the Registration of Very Weak Currents and Tensions, Colorimeters, Photometers, Densimeters, Cash Registers, and Calculating Machines.

Class 44—Dental, Medical, and Surgical Appliances

For Medical Apparatus for Measurement of the Metabolic Rate; Apparatus for Direct Oxygen Saturation Measurement of Blood During Heart Catheterization and Recording of Dye Dilution Curves; and Hemoreflector for Measuring the Percentage of Oxygen Saturation in Blood.

First use August 1958; in commerce Aug. 12, 1959.

SN 201,825. The Cramer Chemical Company, Gardner, Kans. Filed Sept. 14, 1964.

Cramer of GARDNER, KANSAS

The words "of Gardner, Kansas" are disclaimed apart from the mark as shown. Owner of Reg. Nos. 418,406, 568,042 and others.

Class 4—Abrasives and Polishing Materials

For Liquid Rubber and Leather Ball Cleaner and Polish.
First use Jan. 7, 1949.

Class 6—Chemicals and Chemical Compositions

For Shoe Dressing and Adherent for Adhesive Tape.
First use Aug. 10, 1943.

Class 18—Medicines and Pharmaceutical Preparations

For Tablets for the Relief of Pain, Antacid Preparations, Ammonia Inhalants, Aspirin, Atheletic Liniment, Massaging Ointment, Rub-Down Liniments, Tablets To Relieve Nervous Tension, Analgesic Balm, Vitamin Tablets, Salt Tablets, Foot Ointment, Germicidal and Fungicidal Preparation for Treating Athletes Foot and Other Fungus Infections, Inhalant To Promote Breathing, Isopropyl Alcohol, Germicide, Antiseptic Ointment, Skin Lubricant and Spray Vaporizer.
First use Aug. 10, 1943.

Class 22—Games, Toys, and Sporting Goods

For Magnesium Carbonate Sticks, Rosin, Paste Mixture for External Use To Counteract Glare, Elastic Wrap, and Anti-Slip Preparation for Sports Use.
First use Aug. 10, 1943.

Class 44—Dental, Medical, and Surgical Appliances

For Cotton Tipped Applicators, Cold Packs, Felt, Foam Rubber and First Aid Kits.
First use Aug. 10, 1943.

Class 46—Foods and Ingredients of Foods

For Pre-Packaged Dietary Foods Consisting of Cookies and a Drink.
First use Jan. 14, 1963.

Class 51—Cosmetics and Toilet Preparations

For Foot and Body Powder, Deodorant, Astringent, Skin Lotion for Prevention of Sunburn and Liquid Preparations for External Use To Protect and Toughen Skin.
First use Aug. 10, 1943.

Class 52—Detergents and Soaps

For Athletic Soap, Hand Cleaner, Paste Ball Cleaner and Tape Remover.
First use Aug. 10, 1943.

SN 220,449. Bell Auto Parts, Inc., Bell, Calif. Filed June 7, 1965.

CRAGAR

Class 19—Vehicles

For Automotive Equipment and Accessories—Namely, Custom Wheels, Steering Wheels and Disc Brakes.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Machinery and Tools and Parts Thereof—Namely, Engine Adapters and Supercharger Kits.

First use Apr. 8, 1955.

SN 221,982. Adidas S.A.R.L., Dettwiller, Bas-Rhin, France. Filed June 25, 1965.

CANGORAN

Owner of French Reg. No. 1,173, dated Apr. 7, 1965 (Saverne); Natl. Inst. No. 221,982.

Class 1—Raw or Partly Prepared Materials

For Leather.

Class 39—Clothing

For Footwear—Namely, Boots, Shoes, and Slippers.

SN 225,214. Harriet Taylor, d.b.a. Varil Industries, Evanston, Ill. Filed Aug. 6, 1965.

Varil

Class 39—Clothing

For Ladies' Hats or Millinery.

Class 40—Fancy Goods, Furnishings, and Notions

For Headbands, Plain and Adorned, Including Huggy Head Bands.

First use May 13, 1965.

SN 226,535. Inter-Continental Trading Corporation, New York, N.Y. Filed Aug. 26, 1965.

ITC

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Business Machines—Namely Typewriters.

Class 26—Measuring and Scientific Appliances

For Calculators and Cash Registers.

First use on or about July 20, 1965.

SN 230,040. Faroy, Inc., Houston, Tex. Filed Oct. 13, 1965.

FAROY

Class 15—Oils and Greases

For Candles.
First use November 1950.

Class 34—Heating, Lighting, and Ventilating Apparatus

For Candle Holders.
First use January 1963.

SN 231,657. The Wickes Corporation, Saginaw, Mich. Filed Oct. 27, 1965.

WALDORF

Class 13—Hardware and Plumbing and Steam Fitting Supplies

For Hardware, Particularly for Cabinets.
First use Mar. 18, 1965.

Class 20—Linoleum and Oiled Cloth

For Floor Tile Comprising Vinyl and Asphalt Tile.
First use Apr. 29, 1965.

SECTION 2

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Opposition under section 13 may be filed within thirty days of publication. See Rules 2.101 to 2.105.

A fee of twenty-five dollars must accompany the opposition.

[NOTE: For publication of marks presented in a combined application for registration in more than one class, see section 1.]

Class 1—Raw or Partly Prepared Materials

SN 198,035. Fleming-Joffe, Ltd., New York, N.Y. Filed July 17, 1964.

BRAVO CALF

The term "Calf" is disclaimed apart from the mark as shown.

For Decorated Leather for Handbags and Leather in the Piece for Use in the Manufacture of Handbags.

First use Apr. 15, 1964.

SN 237,542. Dairyland Seed Company, Inc., Campbellsport, Wis. Filed Jan. 27, 1966.

DS

For Farm Seeds.
First use on or about Oct. 11, 1965.

SN 238,014. Stark Bro's Nurseries & Orchards Co., Louisiana, Mo. Filed Feb. 3, 1966.

STARK DOUBLE-DWARF

Owner of Reg. Nos. 44,394, 741,434, and others.

For Fruit Trees and Plants, and Scions, Cuttings, Grafts, Roots, and Stocks Thereof.

First use on or about Jan. 5, 1966.

SN 240,871. Emerald Furs Limited, Newark, N.J. Filed Mar. 14, 1966.

BLACK EMERALD

For Natural Ranch Mink Pelts.
First use on or about July 20, 1955.
Subj. to Intf. with SN 232,069.

SN 241,361. Nichols & Company, Inc., Boston, Mass. Filed Mar. 18, 1966.

WELLSTRAND

For Nylon Fibers.
First use July 15, 1965.

Class 3—Baggage, Animal Equipments, Portfolios, and Pocketbooks

SN 239,168. Neiman-Marcus Company, Dallas, Tex. Filed Feb. 18, 1966.

R.S.V.P.

For Handbags and Pocketbooks.
First use Aug. 15, 1964.

SN 239,511. Garay & Co., Inc., New York, N.Y. Filed Feb. 24, 1966.

Knack

For Handbags and Ladies' Belts.
First use Feb. 18, 1966.

Class 4—Abrasives and Polishing Materials

SN 215,153. Alberto-Culver Company, Melrose Park, Ill. Filed Mar. 29, 1965.

TEAM MATE

For Preparation for Application to Hard Surfaces Such as Floors for Cleaning, or Polishing and Protection.
First use Mar. 18, 1965.

SN 234,242. S & S Chemicals, Ltd., Honolulu, Hawaii. Filed Dec. 8, 1965.

BRITE-ITT

For Metal Polishing Compositions.
First use Oct. 1, 1965.

Class 5—Adhesives

SN 226,993. Archer-Daniels-Midland Company, Minneapolis, Minn. Filed Sept. 2, 1965.

JIFFECLENE

For Liquid Binder Used in the Preparation of Foundry Cores and Molds.
First use in or about June 1928.

Class 6—Chemicals and Chemical Compositions

SN 222,592. The Mennen Company, Morristown, N.J. Filed July 2, 1965.

AIR 'N' WEAR

For Clothes Deodorant.
First use June 9, 1965.

SN 222,914. Dexter Chemical Corporation, New York, N.Y. Filed July 8, 1965.

BARISOL

For Wetting Agents, Dispersing Agents and Emulsifiers for Use in the Processing of Textiles.
First use Mar. 19, 1947.

SN 222,915. Dexter Chemical Corporation, New York, N.Y. Filed July 8, 1965.

DEXOPAL

Owner of Reg. No. 439,890.

For Wetting Agents, Water Soluble Oils and Softeners for Organic Fibrous Material, Textile Assistants, Dye Levelling Agents and Emulsifying Agents.

First use Mar. 19, 1947.

SN 222,997. Witco Chemical Company, Inc., New York, N.Y. Filed July 8, 1965.

ULTRAPHOS

For Organic Surfactants—Namely, Wetting, Emulsifying, Spreading, Penetrating and Dispersing Agents.
First use June 22, 1965.

SN 224,041. Warner-Lambert Pharmaceutical Company, Morris Plains, N.J. Filed July 22, 1965.

PATHOTEC

For Diagnostic Reagent for Laboratory Use—Namely, Pathogen Differential Test Papers.
First use June 29, 1964.

SN 224,282. Wyandotte Chemicals Corporation, Wyandotte, Mich. Filed July 26, 1965.

PREVIEW

For Disinfectant-Deodorant for Household and Industrial Use.
First use Sept. 4, 1964.

SN 228,579. Time-Mist, Inc., Stamford, Conn. Filed Sept. 24, 1965.

TIME-MIST

For Aerosol Products—Namely, Air Sanitizers, Fragrances, Insecticides and Odor Neutralizers.
First use Oct. 30, 1964.

SN 234,585. Strauss Stores Corporation, Maspeth, N.Y. Filed Dec. 14, 1965.

STRAUSS STORES

Owner of Reg. No. 605,822.
For Lighter Fluid.
First use September 1952.

SN 238,668. Ranco Industrial Products Corporation, Cleveland, Ohio. Filed Feb. 11, 1966.

FLASH

For Dry Granular Chemical Compound for Melting Ice in the Winter Time.
First use on or about Dec. 15, 1965.

SN 238,828. B. T. Babbitt, Inc., Albany, N.Y. Filed Feb. 15, 1966.

VANO

Owner of Reg. Nos. 392,176, 759,875, and others.
For Fabric Finish.
First use Feb. 21, 1962.

SN 238,833. Baumann Photo-Chemical Corporation, Chicago, Ill. Filed Feb. 15, 1966.

PRINTOFINE

For Photographic Developer.
First use Nov. 19, 1965.

SN 238,916. Baumann Photo-Chemical Corporation, Chicago, Ill. Filed Feb. 16, 1966.

DIAFINE

For Photographic Developer.
First use Feb. 21, 1963.

SN 239,028. Eastman Kodak Company, Rochester, N.Y. Filed Feb. 17, 1966.

EKTAFLO

Owner of Reg. Nos. 574,097, 699,652, and 770,573.
For Photographic Processing Chemicals.
First use Feb. 9, 1966.

SN 239,599. Corn Products Company, New York, N.Y. Filed Feb. 25, 1966.

SLIDE-9

For Ironing Aid Ingredient Incorporated in Starch for Laundry Purposes.
First use at least as early as Mar. 19, 1965.

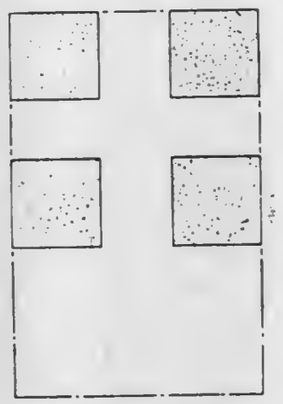
SN 239,600. Corn Products Company, New York, N.Y. Filed Feb. 25, 1966.

HY-PIX

For Starch for Use in the Paper Industry.
First use at least as early as Sept. 22, 1964.

SN 239,624. Hercules Powder Company, Wilmington, Del. Filed Feb. 25, 1966.

RHAP-TROL



For Herbicides.
First use on or about Feb. 1, 1963.

SN 239,770. The Harshaw Chemical Company, Cleveland, Ohio. Filed Feb. 28, 1966.

NOVA

For Bright Nickel Plating Addition Agent.
First use Feb. 15, 1966.

SN 240,353. Southern Agricultural Insecticides, Inc., Palmetto, Fla. Filed Mar. 7, 1966.

The trademark consists of four blocks of the same color or shade, contrasting with the color or shade of the background of the label and arranged relative to each other, as shown. The dot-dash line in the drawing represents the margins of the label or of the central panel thereof. Owner of Reg. No. 571,011.
For Insecticides.
First use May 7, 1958.

SN 240,803. Technic, Inc., Cranston, R.I. Filed Mar. 11, 1966.

TECHNIGOLD

For Gold and Gold Plating Solutions.
First use Feb. 3, 1966.

SN 240,877. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

TRUMP

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 23, 1966.

SN 240,878. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

LUMETON

Owner of Reg. No. 787,000.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 23, 1966.

SN 240,879. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

ACREMIN

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 24, 1966.

SN 240,880. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

IGRAN

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 23, 1966.

SN 240,881. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

ENAROL

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 23, 1966.

SN 240,882. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

GESINDOR

Owner of Reg. No. 786,999.
For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 23, 1966.

SN 240,883. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

OTEGIN

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 24, 1966.

SN 240,884. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

EMALDIN

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 2, 1966.

SN 240,885. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

BLANKISOL

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 23, 1966.

SN 240,886. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

GESAFLOC

Owner of Reg. Nos. 418,283, 719,834, and others.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 24, 1966.

SN 240,887. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

CONFORMAN

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 23, 1966.

SN 240,888. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

AGOLON

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 24, 1966.

SN 240,889. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

OFARIN

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 2, 1966.

SN 240,890. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

LAWN-TOX

Owner of Reg. Nos. 261,556, 798,986, and others.
For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 23, 1966.

SN 240,891. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

GESALAC

Owner of Reg. Nos. 406,217, 727,862, and others.
For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Feb. 23, 1966.

SN 240,893. Geigy Chemical Corporation, Ardsley, N.Y. Filed Mar. 14, 1966.

EVICT

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Feb. 23, 1966.

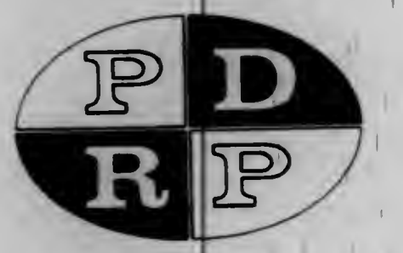
SN 240,894. General Aniline & Film Corporation, New York, N.Y. Filed Mar. 14, 1966.

GAFENOX

For Antioxidants.
First use Dec. 27, 1965.

SN 241,137. Merrill J. Foster, d.b.a. Marine Instrument Co., Fox River Grove, Ill. Filed Mar. 16, 1966.

SILC



For Silicon Dioxide.
First use on or about Feb. 17, 1966.

SN 241,812. Sprayon Products, Inc., Bedford Heights, Ohio. Filed Mar. 24, 1966.

PDRP

For Penetrating, Moisture Removing and Rust Preventing Composition.
First use Feb. 14, 1966.

SN 241,813. Sprayon Products, Inc., Bedford Heights, Ohio. Filed Mar. 24, 1966.

For Penetrating, Moisture Removing and Rust Preventing Composition.
First use Feb. 14, 1966.

SN 248,396. King Kullen Grocery Co., Inc., Westbury, N.Y. Filed June 20, 1966.

Owner of Reg. Nos. 682,619, 802,003, and others.
For Borax and Water Softener for Laundry Use.
First use May 6, 1965.

Class 7 — Cordage

SN 239,104. Alamo Industries, Inc., New York, N.Y. Filed Feb. 18, 1966.

ALAMO

For Olefin Twine.
First use Nov. 12, 1965.

Class 9 — Explosives, Firearms, Equipments, and Projectiles

SN 222,301. South Dakota Fireworks, Inc., Sioux Falls, S. Dak. Filed June 29, 1965.

SHOT GUN

For Cylindrical Firecrackers.
First use Dec. 1, 1964.

SN 222,302. South Dakota Fireworks, Inc. Sioux Falls, S. Dak. Filed June 29, 1965.

RED CHERRY

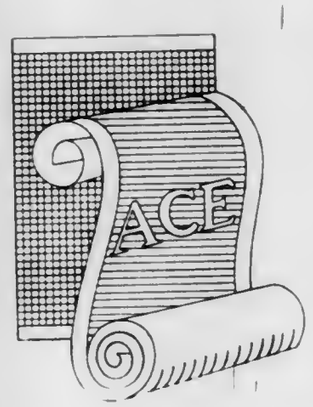
For Cylindrical Firecrackers.
First use Dec. 1, 1964.

SN 222,407. Pachmayr Gun Works, Inc., Los Angeles, Calif. Filed June 30, 1965.

"PRESENTATION MODEL"

The word "Model" is disclaimed apart from the mark as shown.
For Firearm Recoil Pads.
First use Feb. 11, 1965.

Class 10 — Fertilizers



SN 239,652. Northrup, King & Co., Minneapolis, Minn. Filed Feb. 25, 1966.

NATURE'S RATIO

For Lawn Food.
First use Jan. 12, 1966.

Class 11 — Inks and Inking Materials

SN 239,047. J. M. Huber Corporation, Borger, Tex. Filed Feb. 17, 1966.

The drawing is lined for blue, but coloring is not essential except for contrast.
For Carbon Paper.
First use Apr. 25, 1960.

Class 12 — Construction Materials

SN 216,668. Concrete Masonry Research, Incorporated, Orange, Conn. Filed Apr. 16, 1965.

HydrEpoxy

For Resinous Epoxy Compound for Coating Articles and Resinous Epoxy Compounds Mixed With Mortars, Including Hydraulic Cements, and the Like.
First use Jan. 12, 1965, on resinous epoxy compounds.

SN 221,166. Textron Electronics Inc., Providence, R.I. Filed June 15, 1965.

GC-TELCO

For Antenna Masts—Namely, Telescoping Masts, Mast Tubing, and Lock Joint Masts.
First use August 1957; February 1930 as to "GC"; January 1953 as to "Telco."

SN 222,802. Amerada Glass Corp., Chicago, Ill. Filed July 7, 1965.

FROST-LITE

For Multiple Pane Glass Sheet Glazine Units for Buildings, Display Windows and the Like.
First use Apr. 14, 1965.

SN 225,278. Cerilean Products Company, South Bend, Ind. Filed Aug. 9, 1965.

Cerilean Marbil

The word "Marbil" is disclaimed apart from the mark as shown.
For Synthetic Marble Slabs.
First use Oct. 1, 1963.

SN 227,762. Johns-Manville Corporation, New York, N.Y. Filed Sept. 14, 1965.

VITRO-FLEX

For Fiber Glass Mats.
First use Aug. 11, 1965.

SN 233,984. American Panel Products, Inc., Ypsilanti, Mich. Filed Dec. 6, 1965.

For Exterior and Interior Laminated Structural Panels for Use in Buildings.
First use May 1, 1965.

SN 235,141. United States Plywood Corporation, New York, N.Y. Filed Dec. 22, 1965.

NOVOSHELF

Owner of Reg. Nos. 542,445, 572,330, 802,103 and others.
For Lumber and Wood Products Comprising Wood Particles and Wood Fibers in the Form of a Board or Shelf Having a Metal Hanger Bar.
First use Dec. 6, 1965.

SN 235,799. Sakrete, Inc., Cincinnati, Ohio. Filed Jan. 4, 1966.

The mark is black in the areas so shown and is lined for yellow in the areas indicated. In essence the mark comprises a geometric pattern dominated by a central diamond and including parallel horizontal lines above and below the diamond.
Owner of Reg. No. 349,905.
For Building and Construction Materials—Namely, Mixtures of Sand and Aggregate, Cement and Sand, Cement, Sand and Mortar, Asphalt and Aggregate, Liquid Blacktop Surface Sealer and Mixtures of Plaster and Aggregate.
First use July 14, 1936.

SN 235,821. Continental Chemical Corporation, Bethesda, Md. Filed Jan. 4, 1966.

STEP-ONS

For Stair Carpet Nosings and Stair Treads.
First use Jan. 3, 1966.

SN 238,075. General Refractories Company, Philadelphia, Pa. Filed Feb. 4, 1966.

BRIK-CAST

Owner of Reg. No. 690,070.
For Refractory Castable.
First use at least as early as 1956.

SN 238,244. E. J. Lavino and Company, Philadelphia, Pa. Filed Feb. 7, 1966.

RAMSTAR

For Refractory Ramming Mix.
First use Jan. 20, 1966.

SN 238,245. E. J. Lavino and Company, Philadelphia, Pa. Filed Feb. 7, 1966.

LAVSTAR

For Refractory Shapes.
First use Jan. 20, 1966.

SN 238,246. E. J. Lavino and Company, Philadelphia, Pa. Filed Feb. 7, 1966.

TEMSTAR

For Refractory Shapes.
First use Jan. 20, 1966.

SN 238,247. E. J. Lavino and Company, Philadelphia, Pa. Filed Feb. 7, 1966.

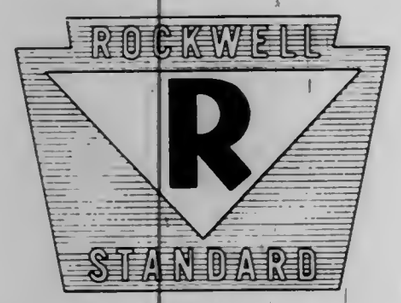
TEMPREZ

For Refractory Shapes.
First use Jan. 20, 1966.

SN 238,248. E. J. Lavino and Company, Philadelphia, Pa. Filed Feb. 7, 1966.

PREREZ

For Refractory Shapes.
First use Jan. 20, 1966.



Class 13—Hardware and Plumbing and Steam-Fitting Supplies

SN 221,167. Textron Electronics, Inc., Providence, R.I. Filed June 15, 1965.

GC-TELCO

For Television Hardware—Namely, Television Stand-Offs, Television Roof Mounts, Television Antenna Mounts of the Wall Type, Chimney Type, Vent Type, and Peak and Mast Types; and Television Installation Accessories, Namely, Strapping, Turnbuckles, Guy Rings, Mast Couplers, Guy Wire Clamp and Guy Ring Supports, Guy Wire Clamps, Guy Wire Thimbles, Mast Straps, Chimney Straps, Installation Screw Eyes, Screw Hooks, Screws, Bolts, and Nuts, Expansion Shields, Screw Anchors, Nail Drive-In Anchors, Standoff Mast Straps, U-Clamps and Bolts, Chimney Strap Clips, and Toothed Antenna Support Brackets.
First use August 1957; February 1930 as to "GC"; January 1953 as to "Telco."

SN 237,486. Rockwell-Standard Corporation, Pittsburgh, Pa. Filed Jan. 27, 1966.

The drawing is lined for blue. Owner of Reg. Nos. 695,203, 708,940, and others.
For Clip Type Fasteners.
First use at least in April 1958.

SN 238,507. Ethyl Corporation, New York, N.Y. Filed Feb. 10, 1966.

BELL:RING

For Plastic Pipe and Fittings.
First use Nov. 11, 1965.

SN 238,755. Linair Engineering Division, Inglewood, Calif. Filed Feb. 14, 1966.

For Industrial Pipe Couplings and Fittings.
First use Dec. 1, 1965.

SN 238,853. Frank Doerner & Sons Limited, Waterloo, Ontario, Canada. Filed Feb. 15, 1966.

NYLA-BUSH

Priority claimed under Sec. 44(d) on Canadian application filed Aug. 26, 1965, Reg. No. 144,111, dated Feb. 18, 1966.
For Chair Controls.

SN 238,854. Dynamic Valves, Inc., Mountain View, Calif. Filed Feb. 15, 1966.

DYVAL

For Hydraulic Valves.
First use Apr. 9, 1965.

SN 238,952. Hanszen Plastics Corporation, Dallas, Tex. Filed Feb. 16, 1966.

OFL

For Flake Lined Reinforced Plastic Pipe.
First use Jan. 1, 1963.

SN 239,031. Rudolph Erenhouse, d.b.a. Cosmos Product Company, New York, N.Y. Filed Feb. 17, 1966.

NORDISK

For Stainless Steel Hollow Ware.
First use Jan. 10, 1966.

SN 239,043. Joseph Gillott & Sons Limited, Dudley, England. Filed Feb. 17, 1966.

SPRITE

Owner of British Reg. Nos. 880,698, dated June 12, 1965 and 881,156, dated June 24, 1965.
For Furniture Castors.

SN 239,070. National Fastener Corp., New York, N.Y. Filed Feb. 17, 1966.

NATIONAL

For Zippers.
First use Feb. 2, 1946.

SN 239,178. Tylok International, Inc., Euclid, Ohio. Filed Feb. 18, 1966.

Owner of Reg. No. 709,828.
For Couplings and Fittings for Tubing—Namely, Unions, Connectors, T's, Elbows and End Caps.
First use Oct. 1, 1965.

SN 244,771. Timber-Top, Inc., Freeport, N.Y. Filed May 2, 1966.

MS-SYNCLAMPS

Owner of Reg. No. 695,161.
For Fixture Clamps for Mounting Components of Instruments and Apparatus on a Supporting Surface.
First use Feb. 27, 1966.

SN 244,772. Timber-Top, Inc., Freeport, N.Y. Filed May 2, 1966.

MINI-SYNCLAMPS

Owner of Reg. No. 695,161.
For Fixture Clamps for Mounting Components of Instruments and Apparatus on a Supporting Surface.
First use Jan. 10, 1966.

SN 244,773. Timber-Top, Inc., Freeport, N.Y. Filed May 2, 1966.

MICRO-SYNCLAMPS

Owner of Reg. No. 695,161.
For Fixture Clamps for Mounting Components of Instruments and Apparatus on a Supporting Surface.
First use Dec. 17, 1960.

SN 244,774. Timber-Top, Inc., Freeport, N.Y. Filed May 2, 1966.

SUPER-SYNCLAMPS

Owner of Reg. No. 695,161.
For Fixture Clamps for Mounting Components of Instruments and Apparatus on a Supporting Surface.
First use Feb. 27, 1961.

SN 244,775. Timber-Top, Inc., Freeport, N.Y. Filed May 2, 1966.

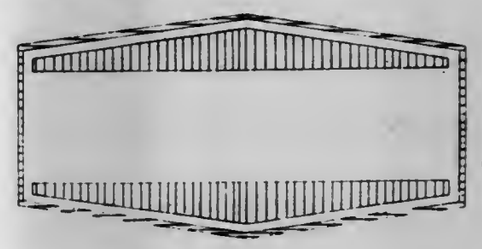
REVER-SYNCLAMPS

Owner of Reg. No. 695,161.
For Fixture Clamps for Mounting Components of Instruments and Apparatus on a Supporting Surface.
First use Dec. 12, 1962.

SN 244,841. Samuel Moore and Company, Mantua, Ohio. Filed May 3, 1966.

REUSAFLEX

For Hose Fittings.
First use July 1964.



SN 248,653. Elastic Stop Nut Corporation of America, Union, N.J. Filed June 22, 1966.

ESLOK

Owner of Reg. Nos. 525,040, 746,173, and others.
For Self-Locking and Self-Sealing Screw Threaded Devices.
First use about Aug. 1, 1965.

Class 15—Oils and Greases

SN 227,745. The Atlantic Refining Company, Philadelphia, Pa. Filed Sept. 14, 1965.

The drawing is lined for red and blue.
For Motor Fuels and Lubricating Oils and Greases.
First use Aug. 27, 1965.

SN 247,857. Armstrong Bros. Tool Co., Chicago, Ill. Filed June 13, 1966.

ARMOIL

For Thread Cutting Oil.
First use July 1965.

Class 16—Protective and Decorative Coatings

SN 237,919. Barker Chemical Company, Chicago, Ill. Filed Feb. 3, 1966.

L-6000

For Thinner for Nitrocellulose Type Lacquer and Acrylic Type Lacquer.
First use June 28, 1964.

SN 241,672. Maas & Waldstein Co., Newark, N.J. Filed Mar. 23, 1966.

Applicant disclaims the phrase "Leadership in Fine Chemical Coatings Since 1876" apart from the mark as shown without waiver of any common law rights. The stippling on the drawing represents shading, and not color. Owner of Reg. No. 421,704.
For Coating Compositions in the Nature of Paints, Varnishes, Lacquers and Enamels.
First use 1904.

Class 17—Tobacco Products

SN 224,320. N. V. Sigarettenfabriek Ed. Laurens "Le Khedive," The Hague, Netherlands. Filed July 27, 1965.

PRIDE OF HOLLAND

No claim is made to the exclusive use of the word "Holland" apart from the mark as shown. Owner of Dutch Reg. No. 145,888, dated Sept. 18, 1962.
For Cigarettes, Cigars and Smoking Tobacco.
First use May 26, 1964; in commerce June 1, 1965.

SN 224,321. N. V. Sigarettenfabriek Ed. Laurens "Le Khedive," The Hague, Netherlands. Filed July 27, 1965.

PRINCE OF HOLLAND

No claim is made to the exclusive use of the word "Holland" apart from the mark as shown. Owner of Dutch Reg. No. 145,889, dated Sept. 18, 1962.
For Cigarettes, Cigars and Smoking Tobacco.
First use July 8, 1964; in commerce June 1, 1965.

SN 233,678. Carreras Limited, Basildon, Essex, England. Filed Dec. 1, 1965.

The drawing is lined for red and gold. Owner of British Reg. No. 825,617, dated Sept. 25, 1961 and U.S. Reg. Nos. 43,162 and 574,864.
For Cigarettes.

SN 234,019. Faber, Coe & Gregg, Inc., Newark, N.J. Filed Dec. 6, 1965.

SMS

For Cigars.
First use Nov. 3, 1965.
Subj. to Intf. with SN 239,945.

Class 18—Medicines and Pharmaceutical Preparations

SN 204,469. Guardian Chemical Corporation, Long Island City, N.Y. Filed Oct. 21, 1964.

GUARDETS

For Pharmaceutical Lozenges for Colds, Sore Throats, and the Like.
First use Sept. 30, 1964.

SN 228,111. Armour Pharmaceutical Company, Chicago, Ill. Filed Sept. 20, 1965.

AMORINE

For Anti-Inflammatory Preparation Containing Acetylsalicylic Acid.
First use Sept. 13, 1965.

SN 228,553. Merck & Company, Inc., d.b.a. Quinton Company, Rahway, N.J. Filed Sept. 24, 1965.

DITRON

For Oral Antiseptic for Use as a Mouthwash and for the Relief of Pain Associated With Sore Gums, Particularly for Denture Wearers.
First use Aug. 26, 1965.

SN 228,650. Cutter Laboratories, Inc., Berkeley, Calif. Filed Sept. 27, 1965.

STIP

Owner of Reg. Nos. 257,166 and 636,372.
For Blood Stop Larvicidal Powder for Veterinary Use.
First use Feb. 15, 1955.

SN 228,653. Cutter Laboratories, Inc., Berkeley, Calif. Filed Sept. 27, 1965.

R-GENE

Owner of Reg. No. 675,481.
For Intravenous Medication for Use in the Treatment of Ammonia Intoxication.
First use Jan. 3, 1957.

SN 228,654. Cutter Laboratories, Inc., Berkeley, Calif. Filed Sept. 27, 1965.

POISONOK

Owner of Reg. Nos. 432,782, 522,866, and 624,812.
For Extract of the Active Principal of Rhus Diversiloba Used To Enable the System To Build Resistance to the Rash Produced by Poison Oak or Ivy.
First use February 1924.

SN 228,655. Cutter Laboratories, Inc., Berkeley, Calif. Filed Sept. 27, 1965.

PLASMANATE

Owner of Reg. No. 665,653.
For Human Blood Fraction Used in Intravenous Therapy.
First use Sept. 24, 1956.

SN 229,711. Abbott Laboratories, North Chicago, Ill. Filed Oct. 11, 1965.

℞

For Pharmaceutical Preparations for Pediatric Use.
First use Nov. 17, 1964.

SN 237,005. Malingson Pharmaceuticals, Inc., Fairfax, Va. Filed Jan. 21, 1966.

TRUSTIN

For Analgesic Medicinal Preparations.
First use at least as early as Dec. 19, 1965.

SN 237,134. Johnson & Johnson, New Brunswick, N.J. Filed Jan. 24, 1966.

UMBILEX

For Antiseptic Preparation for Topical Use.
First use Nov. 5, 1965.

SN 237,310. Cilag-Chemie Aktiengesellschaft (Cilag-Chimie Societe Anonyme) (Cilag-Chemie Limited), Schaffhouse, Switzerland. Filed Jan. 26, 1966.

THALAMONAL

Owner of Swiss Reg. No. 192,948, dated July 4, 1962.
For Pharmaceutical Preparations.

SN 237,744. Ralston Purina Company, St. Louis, Mo. Filed Feb. 1, 1966.

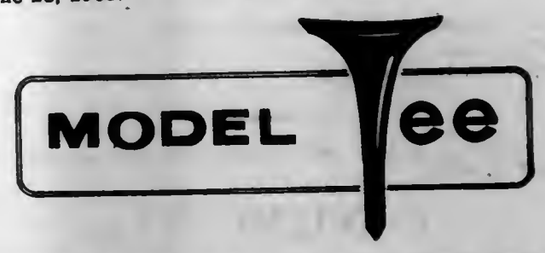
NOVO-MAST

For Antibiotic Preparations for Bovine Mastitis.
First use Dec. 10, 1965.

SN 241,907. Dr. Le Gear, Inc., St. Louis, Mo. Filed Mar. 25, 1966.

BIG 10

For Veterinary Preparation for Bacterial Diarrhea, Bacterial Enteritis, and Pneumonia in Calves.
First use Feb. 21, 1966.



SN 249,465. A. H. Robins Company, Incorporated, Richmond, Va. Filed July 5, 1966.

DONNAMYCIN

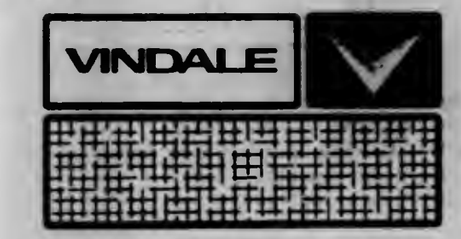
For Pharmaceutical Preparation Used as an Antidiarrheal.
First use May 5, 1966.

Class 19—Vehicles

SN 221,816. Fore Motor Cart Company, Detroit, Mich. Filed June 23, 1965.

Applicant disclaims the word "Model" apart from the mark as shown.
For Electrically Powered Wheeled Carts.
First use Mar. 17, 1965.

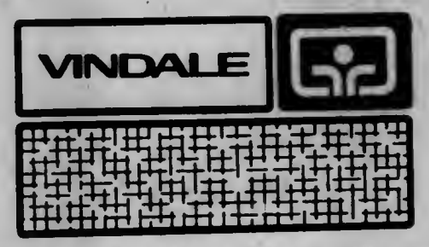
SN 229,714. Aid Stores, Inc., Woodside, N.Y. Filed Oct. 11, 1965.



For Automotive Lined Brake Shoes.
First use January 1954.

SN 231,591. Outboard Marine Corporation, Waukegan, Ill. Filed Oct. 24, 1965.

CAPRICE



For Boats and Parts Therefor.
First use about May 1965.

SN 232,041. Vindale Corporation, Brookville, Ohio. Filed Nov. 2, 1965.

The drawing is lined for gold. Owner of Reg. No. 604,410.
For Mobile Homes.
First use Aug. 31, 1965.

SN 232,042. Vindale Corporation, Brookville, Ohio. Filed Nov. 2, 1965.

The drawing is lined for gold. Owner of Reg. No. 604,410.
For Mobile Homes.
First use Sept. 2, 1965.

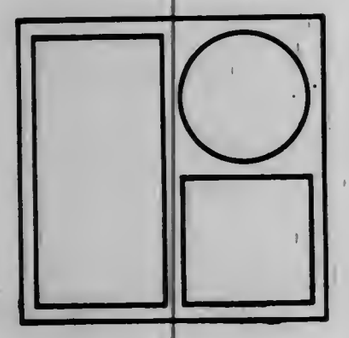
SN 232,152. Rockwell-Standard Corporation, Pittsburgh, Pa. Filed Nov. 4, 1965.

FLEETMASTER

For Components for Vehicles—Namely, Trailer Axles and Leaf Springs.
First use June 16, 1965.

SN 232,271. Arnold, Schwinn & Co., Chicago, Ill. Filed Nov. 8, 1965.

CONTINENTAL



Owner of Reg. No. 414,174.
For Bicycles.
First use July 28, 1944.

SN 232,384. Western Mass. Associates, Inc., West Springfield, Mass. Filed Nov. 9, 1965.

For Bicycle Windshields.
First use Oct. 18, 1965.

SN 238,251. Litton Industries, Inc., Beverly Hills, Calif. Filed Feb. 7, 1966.

The mark consists of the letters "li" and design. Owner of Reg. No. 703,170.
For High Altitude Balloons and Ships, Including Underwater Vehicles Such as Submarines.
First use on or about May 21, 1964.

Class 21—Electrical Apparatus, Machines, and Supplies

SN 209,552. King-Seeley Thermos Co., Ann Arbor, Mich., assignee of Structo Manufacturing Company, Freeport, Ill. Filed Jan. 7, 1965.

For Hood, Spit, and Electric Motor Sets for Grills.
First use May 1962.

SN 209,716. Omni Spectra, Inc., Detroit, Mich. Filed Jan. 11, 1965.

OMNI SPECTRA

For Electronic Equipment and Particularly for Wave Guide Systems and Components Therefor.
First use Dec. 28, 1964.

SN 212,384. Blonder-Tongue Laboratories, Inc., Newark, N.J. Filed Feb. 19, 1965.

BLONDER TONGUE

For Electrical Apparatus—Namely, Detectors, Amplifiers, Cathode-Ray Light Pick-Up and Display Apparatus Including Scanning and Related Circuits, Pre-Amplifier Boosters, Converters, Mixer Separators, and Weather-Proof and Radiation-Proof Housings for the Same; Power-Supply Systems; Antennas; Electrical Connectors, Plugs, Cables, Transmission Lines, Line and Cable Couplers, Outlets, Tap-Off Connectors, Mounting Plates, Control Boxes, Isolation and Outlet Networks, Line Splitters, Impedance-Matching Devices, Filters, Attenuators, Attenuation Equalizers, Duplexers, Directional Couplers, Wave Traps, Filters, and Relays.
First use in or about August 1950.

SN 215,077. In-Flight Devices, Inc., Chicago, Ill. Filed Mar. 26, 1965.

GUARD

For Automatic Airplane Landing Gear Control Device—Namely, an Electronic Combination Integrator and Control Device for Detecting and Correcting Unsafe Conditions.
First use June 4, 1964.

SN 217,317. Marshall Industries, San Marino, Calif. Filed Apr. 26, 1965.

NEOLYTHIC

For Ceramic Capacitors.
First use on or about Feb. 12, 1965.

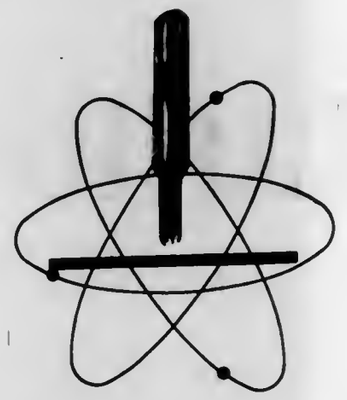
SN 221,168. Textron Electronics Inc., Providence, R.I. Filed June 15, 1965.

GC-TELCO

For Television Antennas, Television Antenna Packs, Comprising the Antenna With Complete Installation Hardware, Television Line Connectors, Cords, and Plugs, Antenna Clips, and Lightning Arrestors.
First use August 1957; February 1930 as to "GC"; January 1953 as to "Telco."

SN 222,565. Fisher Radio Corporation, Long Island City, N.Y. Filed July 2, 1965.

TUNE-O-LITE



For Radio Receivers.
First use Mar. 8, 1965.

SN 223,508. BTU Engineering Corporation, Waltham, Mass. Filed July 16, 1965.

For Electric Furnaces.
First use June 22, 1965.

SN 224,524. Elox Corporation of Michigan, Troy, Mich. Filed July 29, 1965.

No claim is made to the representation of the discharge tube, apart from the mark as shown.
For Machine Tools and Power Supplies Used in Electrical Discharge or Spark Machining of Conductive Metal Workpieces.
First use on or about June 14, 1960.

SN 224,886. Republic Foil, Inc., Danbury, Conn. Filed Aug. 3, 1965.

REPUBLIC

For Aluminum Foil for Electrical and Electronics Applications.
First use Jan. 3, 1950.

SN 235,417. Mule Battery Manufacturing Company, Providence, R.I. Filed Dec. 28, 1965.

Owner of Reg. Nos. 181,596 and 359,758.
For Electrical Storage Batteries.
First use Oct. 23, 1965.

SN 236,016. Sidley Industries, Inc., Chicago, Ill. Filed Jan. 7, 1966.

MUSICRAFT

For Radios.
First use Nov. 8, 1965.

Class 22—Games, Toys, and Sporting Goods

SN 197,121. Head Ski Company, Inc., Dover, Del. Filed July 6, 1964.

For Snow Skis, Ski Poles, Ski Pole Rings, Ski Tip Protectors, Ski Edge Touch-Up Tools, Ski Surface Repair Kits, and Ski Base Treating Material in Liquid Form Packaged in an Aerosol Can.
First use January 1960.

SN 229,516. Fun Things, Inc., Culver City, Calif. Filed Oct. 7, 1965.

WEE PEOPLE

For Toy Figurines or Dolls.
First use May 12, 1965.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

SN 213,968. General Motors Corporation, Detroit, Mich. Filed Mar. 12, 1965.

For Diesel Engines, Parts Thereof, and Accessories—Namely, Fans, Starting Motors, Oil, Water, Hydraulic, and Vacuum Pumps, and Power Takeoff Units Therefor.
First use Feb. 18, 1965; at least as early as November 1937 as to the words "Detroit Diesel."

SN 219,009. Lockwood Technical, Inc., Monterey, Calif. Filed May 17, 1965.

CANDLWHEEL

For Roller-Type Hot Melt Applicator for Applying Adhesive and the Like to a Work Surface.
First use on or about Sept. 2, 1964.

SN 219,901. Packaging Industries Limited, Inc., Montclair, N.J. Filed May 27, 1965.

SENTINEL

Owner of Reg. No. 572,922.
For Machines for Forming Heat Sealed Seams Between Sheets of Flexible or Inflexible Material by Means of the Application of Heat and Pressure; and for Machines for Forming Three Dimensional Containers From Sheet Material and for Filling the Same and for Sealing Lids to the Filled Containers; and for Machines for Conveying Packages and/or Packaging Equipment, Said Conveying Machines Being of Either Power Driven or Roller Type.
First use Nov. 26, 1951.

SN 220,253. The O.K. Tool Company, Inc., Milford, N.H. Filed June 2, 1965.

CHILCUT

For Apparatus for Cooling Machine Tools.
First use May 18, 1965.

SN 220,679. Benjamin Mills III, Needham Heights, Mass. Filed June 8, 1965.

INDICO

For Position Indicators for Rotating Stem Reversing Service Devices, Including Valves of the Butterfly Type Employed in Water Mains, Reel Operated Leveling Devices, Dampers, and the Like.
First use May 5, 1965.

SN 220,718. H. W. Ward & Co., Limited, Selly Oak, Birmingham, England. Filed June 8, 1965.

Ward

Owner of British Reg. No. 384,709, dated Apr. 5, 1938.
For Lathes.
First use Jan. 1, 1924; in commerce 1933.

SN 225,987. Minneapolis-Moline, Inc., Hopkins, Minn. Filed Aug. 18, 1965.

Hot Line

The drawing is lined for the color red.
For Complete Line of Parts and Accessories for Agricultural and Industrial Machinery, Implements and Accessories —Namely, Internal Combustion Engines, Tractors, Combines, Huskers, Snappers, Shellers, Picker-Shellers, Power Units, Balers, Plows, Mowers, Harrows, Choppers, Strippers, Windrowers, Planters, Drills, Cultivators, Spreaders, Loaders, Irrigation Units, Pulverizers, Rakes, Discers, Soil Conditioners, Blowers, Rotary Hoes, Middlebreakers, Tool Carriers, Fertilisers and Weeders.
First use April 1963; as early as August 1960 as to "Hot Line."

SN 226,607. Atlas Supply Company, Springfield, N.J. Filed Aug. 27, 1965.

ATLAS

Owner of Reg. Nos. 292,092, 729,390, and others.
For Air Powered Impact Wrench.
First use July 13, 1965.

SN 227,251. Clark Equipment Company, Buchanan, Mich. Filed Sept. 7, 1965.

CLARK

Owner of Reg. Nos. 165,644, 737,108, and others.
For Digging and Loading Vehicles.
First use June 10, 1965.

SN 228,187. Plasti-Shell Corporation, Philadelphia, Pa. Filed Sept. 20, 1965.

PLASTI-SHELL

For Mounting Shells for Printing Mats.
First use Nov. 20, 1964.

SN 228,298. Agatsuma Seiki Kabushiki Kaisha, Sakakimachi, Hanishina District, Nagano Prefecture, Japan. Filed Sept. 22, 1965.

AK

For Needle Plates, and Slide Plates for Use with Needle Plates, for Electric and Manually Operated Sewing Machines.
First use April 1962; in commerce April 1962.

SN 229,640. Ben I. Davis, d.b.a. Ranger Tool Company, Ellendale, Tenn. Filed Oct. 8, 1965.

RANGER IX

For Machine for Skinning or Peeling Linked Sausages, Frankfurters, Wieners, and the Like.
First use Aug. 10, 1965.

SN 230,797. Dana Corporation, Toledo, Ohio. Filed Oct. 21, 1965.

TRIPLEX PISTONS

No registration rights are claimed by the word "Piston" nor in the descriptive representation of the goods (pistons); applicant waives none of its common law rights in the mark shown or any feature thereof. Owner of Reg. No. 522,247.
For Pistons for Internal Combustion Engines.
First use on or about Oct. 4, 1965.

SN 230,843. Kimball Systems Inc., Belleville, N.J. Filed Oct. 21, 1965.

KIMPRESS

Owner of Reg. No. 624,923.
For Imprinting Machines for Tags, Tickets, Labels, and the Like.
First use not later than Nov. 30, 1964.

SN 231,107. Giesen & Forsthoff, Solingen, Germany. Filed Oct. 22, 1965.

TIMOR

Owner of German Reg. No. 260,535, dated June 25, 1920.
For Cutlery, Especially Razors, Pocket-Knives, Penknives, Scissors of All Kinds, Hair Thinning Devices, Hair Shapers, Hair Clippers, and Manicuring Instruments.
First use Feb. 19, 1921; in commerce Jan. 5, 1950.

SN 231,224. Ralphs Unified Limited, Leicester, England. Filed Oct. 22, 1965.

R UNIFIED

For Machinery for Manufacturing and Repairing Boots and Shoes, and Parts of Such Machinery.
First use June 1964; in commerce June 1964.

SN 231,852. Riggs & Lombard, Inc., Lowell, Mass. Filed Oct. 29, 1965.

DRAGNAUGHT

For Textile Machinery—Namely, Continuous Washers for Washing Elongated Webs of Material.
First use Sept. 27, 1965.

SN 231,904. Ted L. Ferrier, Jr., Dallas, Tex. Filed Nov. 1, 1965.

RAZOR-MATE

For Removable Protective Covers for Safety Razor Heads Having Blades Therein.
First use on or about June 18, 1964.

SN 232,877. Jackson Vibrators, Inc., Ludington, Mich. Filed Nov. 17, 1965.

BEACHLEACH

For Vehicles for Cleaning and Separating Refuse From the Soil.
First use Apr. 7, 1965.

SN 233,540. Union Carbide Corporation, New York, N.Y. Filed Nov. 29, 1965.

ZENDEL

For Agricultural Implements — Namely, Tractor-Drawn Planters.
First use July 15, 1965.

SN 233,858. Apsco Products, Inc., Rockford, Ill. Filed Dec. 3, 1965.

Atlas

For Pencil Sharpeners, and Parts Therefor.
First use Oct. 7, 1952.

SN 236,893. The Jacobs Manufacturing Company, West Hartford, Conn. Filed Jan. 20, 1966.

MULTI-CRAFT

For Chucks.
First use 1952.

SN 237,112. HPC, Inc., Chicago, Ill. Filed Jan. 24, 1966.

KEYRIFFIK

For Key Duplicating Machines.
First use June 11, 1965.

SN 237,772. Woodford Manufacturing Co., Des Moines, Iowa, Filed Feb. 1, 1966.

BARLIFT

For Dock Plates.
First use on or about May 20, 1964.

SN 237,773. Woodford Manufacturing Co., Des Moines, Iowa. Filed Feb. 1, 1966.

LIFTOMATIC

For Dock Plates.
First use on or about June 15, 1962.

SN 237,952. Fuel Injection Parts. Co., Inc., West Springfield, Mass. Filed Feb. 3, 1966.

FIPCO

For Fuel Injection Parts and Components for Fuel Injection Pumps.
First use Apr. 15, 1961.

SN 237,995. Mine and Smelter Supply Co., Denver, Colo. Filed Feb. 3, 1966.

HI-PROB

For Sizers.
First use Sept. 1, 1965.

SN 238,562. Reed Roller Bit Company, Houston, Tex. Filed Feb. 10, 1966.

ROTO-TORQ

For Torque Wrenches.
First use Dec. 6, 1944.

SN 238,803. The Union Fork and Hoe Company, Columbus, Ohio. Filed Feb. 14, 1966.

PUSH EZE

Owner of Reg. No. 805,536.
For Hand-Operated Lawn and Garden Tools—Namely, Rotary Lawn Edgers.
First use Jan. 28, 1966.

SN 238,809. Washington Forge, Incorporated, Englishtown, N.J. Filed Feb. 14, 1966.

WASHINGTON FORGE

For Kitchen, Table and Steak Knives.
First use June 1945.

SN 238,810. Washington Forge, Incorporated, Englishtown, N.J. Filed Feb. 14, 1966.

The mark consists of the letters "WF" and crest design.
For Kitchen and Table Cutlery and Stainless Steel Flatware.
First use June 1955.

SN 238,870. Robert A. Gilmour, d.b.a. Gilmour Manufacturing Co., Somerset, Pa. Filed Feb. 15, 1966.

DIAL-O-MATIC

For Spray Heads for Liquids.
First use June 6, 1961.

SN 238,874. The Huffman Manufacturing Company, Miamisburg, Ohio. Filed Feb. 15, 1966.

SHERATON

Owner of Reg. No. 694,506.
For Lawn Mowers and Garden Tillers, and Parts Therefor.
First use July 28, 1959.

SN 238,984. Tu-Bar Corporation, Cleveland, Ohio. Filed Feb. 16, 1966.

Owner of Reg. No. 735,625.
For Press Brake Type Sheet Metal Bending Machines.
First use on or about May 24, 1961.

SN 240,435. Hein-Werner Corporation, Waukesha, Wis. Filed Mar. 8, 1966.

HEIN-WERNER

Owner of Reg. No. 671,510.
For Earth Moving Machines.
First use Feb. 1, 1962.

SN 240,436. Hein-Werner Corporation, Waukesha, Wis. Filed Mar. 8, 1966.

No claim is made to the representation of the bucket apart from the mark as shown. Owner of Reg. No. 671,510.
For Earth Moving Machines.
First use Jan. 22, 1966; Feb. 1, 1962, as to "Hein-Werner."

SN 242,728. Hein-Werner Corporation, Waukesha, Wis. Filed Apr. 5, 1966.

Hein-Werner

Owner of Reg. No. 671,510.
For Earth Moving Machines.
First use Apr. 19, 1962; Feb. 1, 1962, as to "Hein-Werner."

SN 248,240. Mack Trucks, Inc., Allentown, Pa. Filed June 16, 1966.

MAXIDYNE

For Internal Combustion Engines.
First use Apr. 27, 1966.

SN 248,574. Harvey W. Bergander, d.b.a. Bergander Mfg. Co., Skokie, Ill. Filed June 21, 1966.

GULMITE

For Screw Drivers, Nut Drivers and Wrenches.
First use at least as early as 1934.

Class 26—Measuring and Scientific Appliances

SN 203,414. Meter-All Mfg. Co., Inc., Dallas, Tex. Filed Oct. 6, 1964.

VEND-TROL

Combination Device for Counting the Number of Coins Deposited in Coin Operated Devices and for Printing the Total Thereof.
First use Apr. 17, 1964.

SN 228,815. Eugene Ernst Products Co., Farmingdale, N.J. Filed Sept. 28, 1965.

EEP/

For Sight Flow Indicators, Gauge Glasses, Liquid Level Gauges, Water Gauges, and Components Thereof.
First use Mar. 5, 1962.

SN 230,605. Bausch & Lomb Incorporated, Rochester, N.Y. Filed Oct. 20, 1965.

BALREX

Owner of Reg. No. 575,207.
For Spectacles.
First use Oct. 1, 1965.

SN 231,435. Jean-Pierre Marchon, Versoix, Geneva, Switzerland. Filed Oct. 23, 1965.

MANORLINE

Owner of Swiss Reg. No. 210,521, dated Mar. 30, 1965.
For Eye Glasses, Including Protective Glasses, Safety Glasses, Sun and Anti-Glare Glasses, and Optical Frames.

SN 231,560. Formfoto Manufacturing Company, Villa Park, Ill. Filed Oct. 24, 1965.

fm

For Copy Making Apparatus, and Parts Thereof.
First use in or about July 1964.

SN 231,854. Sea & Ski Corporation, Millbrae, Calif. Filed Oct. 29, 1965.

GIRL CATCHERS

For Sunglasses.
First use Oct. 18, 1965.

SN 235,488. Birns & Sawyer Cine Equipment Co., Inc., Los Angeles, Calif. Filed Dec. 29, 1965.

AURIBELL FOCUSIGHT

For Movie Camera Accessory—Namely, a Mounted Optical Prism and Magnifier, Insertable Into the Film Gate of a Non-Reflex Movie Camera for Visual Checking of the Camera Lens Focus, Field of View, and Depth of Field.
First use Dec. 3, 1965.

SN 240,618. Ion Physics Corporation, Burlington, Mass. Filed Mar. 10, 1966.

IPC

The drawing is lined for the colors red and blue.
For Flash X-Ray Machines and Micro-Meteoroid Impact Simulators.
First use Feb. 18, 1966.

SN 240,619. Ion Physics Corporation, Burlington, Mass. Filed Mar. 10, 1966.

"implion"

For Radiation Detectors.
First use Feb. 11, 1966.

SN 242,689. William Wahl Corporation, Santa Monica, Calif. Filed Apr. 4, 1966.

HEAT SPY

For Temperature Indicating Devices That Show Temperatures by Changes of Appearance, and Infrared Thermometers.
First use on or about May 10, 1965.

Class 28—Jewelry and Precious-Metal Ware

SN 233,490. Gold-Master Corp., New York, N.Y. Filed Nov. 29, 1965.

GOLD MASTER

The word "Gold" is disclaimed apart from the mark as shown.
For Men's and Women's Rings.
First use May 27, 1964.

SN 233,491. Gold-Master Corp., New York, N.Y. Filed Nov. 29, 1965.

G.M.C. CREATIONS

The word "Creations" is disclaimed apart from the mark as shown.
For Men's and Women's Rings.
First use July 17, 1964.

Class 29—Brooms, Brushes, and Dusters

SN 227,790. United Distributors Service, Inc., d.b.a. United Distributors Service, Roanoke, Va. Filed Sept. 14, 1965.

UDS

For Wash Mitts, Polishing Bonnets, Chamois, Sponges, Polishing Disc Pads, and Bug Remover Pads.
First use Jan. 2, 1963.

Class 30—Crockery, Earthenware, and Porcelain

SN 230,664. Lenox, Incorporated, Trenton, N.J. Filed Oct. 20, 1965.

LENOX

Owner of Reg. Nos. 119,736, 769,522, and others.
For Vases, Pitchers, Urns, Pin Trays, Nut Bowls, Nut Dishes, Jars, Coasters, Tea Pots, Candy Bowls, Candy Dishes, Serving Bowls, Relish Dishes, Ornamental Trays, Bowls, and Dishes for Use as Centerpieces and the Like, Playing Card Boxes, and Boxes and Containers for Small Miscellaneous Items, All Formed of Ceramic Material.
First use 1900.

Class 31—Filters and Refrigerators

SN 220,881. Seitz-Asbest-Werke Theo & Geo Seitz Kommanditgesellschaft, Bad Kreuznach, Germany. Filed June 10, 1965.

ORIGINAL SWK WEST-GERMANY

The words "Original" and "West-Germany" are disclaimed as a part of the mark.
For Filtering Materials and Filter Sheets Made of Derivatives of Said Filtering Materials, Especially Raw and Refined Powders, Fibers and Granulates of Organic and Inorganic Origin and Mixtures of All Types of Said Substances, Mixtures of Said Raw Materials, and Mixtures Thereof With Coal, Earth, Sand and Diatomaceous Earth; Felt, Vegetable Fibers, Synthetic Fibers, Linen, Paper, and Cotton.
First use Mar. 2, 1965; in commerce Mar. 22, 1965.

SN 223,540. The Dole Valve Company, Morton Grove, Ill. Filed July 16, 1965.

PACER

For Ice Refrigerated Beverage Dispensing Units.
First use in or about mid-July 1961.

SN 223,541. The Dole Valve Company, Morton Grove, Ill. Filed July 16, 1965.

DIRECTOR

For Ice Refrigerated Beverage Dispensing Units.
First use in or about January 1960.

SN 223,542. The Dole Valve Company, Morton Grove, Ill. Filed July 16, 1965.

CITATION

For Ice Refrigerated Beverage Dispensing Units.
First use in or about mid-June 1958.

SN 229,382. UCB (Union Chimique-Chemische Bedrijven), Societe Anonyme, Saint-Gilles, near Brussels, Belgium. Filed Oct. 5, 1965.

UCEGO

Priority claimed under Sec. 44(d) on Belgian Reg. No. 104,888, dated Apr. 15, 1965.
For Horizontal Rotating Table Filter With Retractable Retention Band, and Means for Washing the Filter Cloth.

SN 230,247. M. R. Holmes, Jr., Billings, Mont. Filed Oct. 15, 1965.

TRI TRON

For Water Purification System for Removing Impurities by Means of an Electrical Pulse of Controlled Shape and Frequency.
First use Aug. 1, 1965.

SN 232,486. Universal Match Corporation, St. Louis, Mo. Filed Nov. 10, 1965.

Glasco

Owner of Reg. Nos. 306,811 and 596,407.
For Refrigerated vendors for Dispensing Individually Containerized Beverages.
First use Apr. 1, 1933.

Class 32—Furniture and Upholstery

SN 209,387. Baby Relax Ltd., Rainham, Essex, England. Filed Jan. 6, 1965.

BABY RELAX

For Nursery Furniture—Namely, Cribs, Chairs, Highchairs, and Swings for Children.
First use Jan. 8, 1964; in commerce Dec. 8, 1964.

SN 216,258. Delbert H. Browning, d.b.a. Town & Country Mart, Graham, N.C. Filed Apr. 12, 1965.

TOWNCO

For Novelty Type Furniture—Namely, Picture Frames, Letter Holders for Desks, Condiment Racks; and Novelty Furniture Containing a Design Appearance of Washboards—Namely, Magazine Racks, Book Ends, Planter Racks, Sewing Racks, Mail Racks, Pipe Racks, Hat Racks, Vanity Racks, and Tie Racks.
First use Apr. 25, 1964.

SN 227,982. Zeffyr Industries, Inc., Morrison, Ill. Filed Sept. 16, 1965.

ZEFFCO

For Upholstered Furniture.
First use May 13, 1965.

SN 233,200. Tri-State Bedding Company, Incorporated, Bowling Green, Ky. Filed Nov. 23, 1965.

LUXURY CUSHION

No claim is made to the word "Cushion" apart from the mark as shown.
For Mattresses and Box Springs.
First use Jan. 3, 1965.

SN 237,687. Forest Products Corporation, Morristown, Tenn. Filed Feb. 1, 1966.

LIBERTY HILL

For Furniture—Namely, Dining Room, Bedroom, and Occasional Groupings.
First use Jan. 6, 1966.

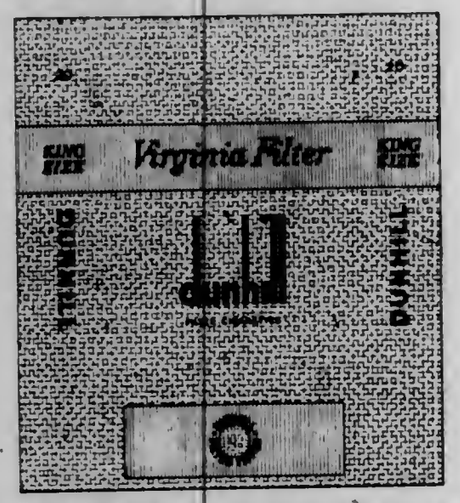
815,648. Iwan Ries & Co., Chicago, Ill. SN 211,538. Filed P.R. 2–8–65; Am. S.R. 7–22–66.

CANADIAN PLUG MIXTURE

The word "Mixture" is disclaimed apart from the mark as shown.
For Smoking Tobacco.
First use about June 1925.

815,649. Iwan Ries & Co., Chicago, Ill. SN 211,895. Filed P.R. 2-12-65; Am. S.R. 7-22-66.

Ries' Private Blend



The word "Blend" is disclaimed apart from the mark as shown.
For Smoking Tobacco.
First use about November 1935.

815,650. The United Kingdom Tobacco Company, Limited, d.b.a. Marcovitch & Co., London, England. SN 212,716. Filed P.R. 2-24-65; Am. S.R. 7-15-66.

The portrait of the man in the mark is fictitious. Owner of British Reg. No. 439,829, dated Aug. 14, 1923; and U.S. Reg. Nos. 196,010 and 726,371.
For Cigarettes and Smoking Tobacco.

815,651. Alfred Dunhill Limited, London, England. SN 229,960. Filed P.R. 10-12-65; Am. S.R. 7-19-66.

The drawing is lined for the colors red and gold, which colors are claimed as a feature of the mark. Owner of Reg. Nos. 527,207; 539,892, and others.
For Cigarettes.
First use Jan. 25, 1965; in commerce July 13, 1965.

Class 19—Vehicles

815,652. Moulton Bicycles Limited, Bradford-on-Avon, England. SN 230,416. Filed 10-18-65.

MOULTON

For Bicycles and Parts Thereof.
First use Nov. 10, 1962.

Class 21—Electrical Apparatus, Machines, and Supplies

815,653. Automatic Power, Inc., Houston, Tex. SN 218,173. Filed P.R. 5-6-65; Am. S.R. 7-26-66.

NO BREAK

For Electric Generating Units.
First use at least as early as November 1959.

815,654. Appleton Electric Company, Chicago, Ill. SN 227,467. Filed P.R. 9-9-65; Am. S.R. 7-21-66.

SWITCHPLUG

For Explosionproof Plugs and Receptacles.
First use May 17, 1965.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

815,655. The Singer Company, New York, N.Y. SN 213,484. Filed P.R. 3-5-65; Am. S.R. 1-13-66.

MERRITT

For Sewing Machines, Parts and Accessories for Sewing Machines.
First use Dec. 15, 1962.

Class 39—Clothing

815,656. Glamorise Foundations, Inc., New York, N.Y. SN 212,406. Filed P.R. 2-19-65; Am. S.R. 7-21-66.

SMOOTH-SEAMS

For Foundation Garments.
First use Feb. 9, 1965.

815,657. Chappell Allen & Co., Limited, Redfield, Bristol, England. SN 222,655. Filed P.R. 7-6-65; Am. S.R. 7-15-66.

FITU

Owner of British Reg. No. 281,493, dated Apr. 2, 1906.
For Corsets.

815,658. Bedford Shirtmakers Corp., New York, N.Y. SN 223,628. Filed P.R. 7-19-65; Am. S.R. 7-25-66.

FAREWELL/IRON

For Men's and Boys' Shirts.
First use July 14, 1965.

Class 44—Dental, Medical, and Surgical Appliances

815,659. Instrumentation Associates Inc., New York, N.Y. SN 210,877. Filed P.R. 1-28-65; Am. S.R. 7-20-66.

PULMO-ANALYSOR

For Portable Thermal Conductivity Apparatus for Testing and Measuring Gases in Human Lungs.
First use 1958.

Notification Re Conflict in Assignment in Certain Applications

Effective September 12, 1966, Assignment Branch will discontinue mailing notification in cases where there is a conflict in assignment between an original application and its divisional, continuation, substitute, or continuation-in-part application.

Assignments from original applications are applied without charge ONLY to divisional, continuation, or substitute applications where the date of the assignment is prior to the filing date of the later-filed application. (Continuation-in-part applications require separate assignments if they are to be issued to the assignee.)

Practitioners are reminded of the provisions of Rule 334. Unless an assignment is filed at or prior to the date of payment of the issue fee, the patent will normally be issued in the name of the inventor.

Section 306 of the Manual of Patent Examining Procedures will be amended appropriately.

W. R. ARMSTRONG,
Director, Office of Patent Services.

Concurred:
(Signed) R. A. WAHL,
Assistant Commissioner.

Adjudicated Patents

(D.C. Calif.) Homberg Patent No. 2,646,911 (224—45), for CONTAINER CARRIER. Claims 1, 2, 4, 5 and 7 to 13 *Held* not infringed. *Illinois Tool Works, Inc.* v. *Brunsing*, 254 F. Supp. 281; 149 USPQ 325.

(D.C.N.Y.) Carter Patent No. 2,733,049 (165—55), for CASTING AND MOUNTING ASSEMBLY FOR CONVECTOR HEATERS. Claims 1, 2, 4 and 5 *Held* invalid. *Rittling Corp.* v. *Slant/Fin Corp.*, 254 F. Supp. 427; 149 USPQ 119.

(D.C.N.Y.) Kellmer and Block Patent No. 2,914,070 (128—558), for BODY ENCIRCLING GARMENTS, *Held* invalid. *Formal Fashions Inc.* v. *Braiman Bows, Inc.*, 254 F. Supp. 389; 149 USPQ 347.

(D.C. Calif.) Poupitch Patent No. 2,923,406 (206—65), for CONTAINER CARRIER. Claims 1 and 2 *Held* not infringed. *Illinois Tool Works, Inc.* v. *Brunsing*, 254 F. Supp. 281; 149 USPQ 325.

(D.C. Mo.) Gerner Patent No. 3,044,798 (280—95), for REPLACEMENT UNIT FOR IDLER ARM BRACKET. Claims 1, 4 and 5 *Held* invalid. *Gerner* v. *Moog Industries*, 254 F. Supp. 969; 149 USPQ 891.

(C.D. Ill.) Flaherty Patent No. 3,086,684 (222—312), for SPREADER GATE ASSEMBLY. Claims 4 and 6 *Held* invalid. *Koehring Co.* v. *E. D. Etnyre & Co.*, 254 F. Supp. 334; 149 USPQ 265.

Termination of Daylight Saving Time

Attention is called to the Notice published in 824 O.G. 1199, March 22, 1966, as to the operation of the Patent Office on Daylight Saving Time. This operation will terminate on October 29, 1966.

	New	Amended
MECHANICAL EXAMINING OPERATION—F. H. BRONAUGH, Director.		
HANDLING AND TRANSPORTING MEDIA, GROUP 310—A. BERLIN, Manager. Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Dispensing; Fluid Sprinkling; Fire Extinguishers; Coin Handling; Check Controlled Apparatus; Classifying and Assorting Solids; Boats; Ships; Aeronautics; Motor and Land Vehicles and Appurtenances; Railways and Railway Equipment; Brakes; Rigid, Flexible and Special Receptacles and Packages.	10-5-64	2-19-64
MATERIAL SHAPING, ARTICLE MANUFACTURING, TOOLS, GROUP 320—N. BERGER, Manager. Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus; Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders; Woodworking; Tools; Cutlery; Jacks; Fasteners.	3-3-64	3-6-62
AMUSEMENT, HUSBANDRY, PERSONAL TREATMENT, INFORMATION, GROUP 330—A. RUEGG, Manager. Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, Etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery; Toiletry; Printing; Typewriters; Stationery; Information Dissemination.	8-17-64	11-14-63
HEAT AND POWER ENGINEERING, GROUP 340—C. F. GAREAU, Manager. Power Plants; Combustion Engines; Fluid Motors; Pumps; Turbines; Heat Generation and Exchange; Refrigeration; Ventilation; Drying; Vaporizing; Temperature and Humidity Regulation; Machine Elements; Power Transmission.	5-18-64	11-7-62
FIXED CONSTRUCTIONS, SUPPORTS, AND HARDWARE, GROUP 350—T. J. HICKEY, Manager. Joints; Fasteners; Rod, Pipe and Electrical Connectors; Miscellaneous Hardware; Locks; Building Structures; Closure Operators; Bridges; Closures; Earth Engineering; Drilling; Mining; Furniture; Receptacles; Supports; Cabinet Structures.		
TEXTILES, CLEANING AND FLUID HANDLING, GROUP 360—W. S. COLE, Manager. Fluid Handling, including Valves; Conduits; Filling Receptacles; Lubrication; Joint Packing; Bathroom Fixtures; Centrifugal Separators; Cleaning; Coating; Pressing; Agitating; Foods; Textiles; Apparel and Shoes and their Manufacture; Sewing Machines; Winding and Reeling.		

DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

ROBERT L. DREYFUS AND JOHN W. HARRISON *v.* MARTIN M. STERNAU

No. 7563. Decided March 24, 1966

[53 CCPA —; 357 F.2d 411; 149 USPQ 63]

1. INTERFERENCE—PATENT AND APPLICATION—RIGHT TO MAKE.

"By copying claims from an issued patent, and lacking express support for the limitations found therein, Sternau was faced with a twofold burden. First, one copying a claim from a patent for the purpose of instituting interference proceedings must show that his application clearly supports the count. *Jepson* v. *Coleman*, 50 CCPA 1051, 314 F.2d 533, 136 USPQ 647. There must be no doubt that an application discloses each and every material limitation of the claims and all doubts must be resolved against the copier. *Jepson* v. *Coleman*, supra; *Bierly* v. *Happoldt*, 40 CCPA 774, 201 F.2d 955, 96 USPQ 406. Second, where support must be based on an inherent disclosure, it is not sufficient that a person following the disclosure might obtain the result set forth in the counts; it must inevitably happen. *Crome* v. *Morrogh*, 44 CCPA 704, 239 F.2d 390, 112 USPQ 49."

2. SAME—SAME—SAME—INHERENT DISCLOSURE.

"In our view, it would do violence to the well-settled principles regarding inherency to hold that Sternau's disclosure and affidavit contain sufficient evidence to warrant a finding that the material limitation in question is inherently disclosed. Both the disclosure and the affidavit are couched in the broadest of generalities, and it would require a bold *ipse dixit* on our part to decide the issue in question in Sternau's favor. This we will not do."

3. SAME—SAME—SAME—SAME.

"The count calls for use of a film of a high shrink energy polymer. It is undisputed that Sternau does not describe the inner ply in terms of shrink energy. Rather, the inner ply is described, inter alia, as a heat shrinkable, oriented film. Under the law of inherency, it is incumbent upon Sternau to establish that a heat shrinkable, oriented film necessarily has a high shrink energy."

APPEAL from the Patent Office. Interference No. 93,409.

REVERSED.

Alvin Guttag (*C. Edward Parker* of counsel) for appellants.

John A. Blair, James M. Heilman for appellee.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

ALMOND, *J.*, delivered the opinion of the court.

This is an appeal from the decision of the Board of Patent Interferences awarding priority of invention of the subject matter of Interference No. 93,409 to Sternau, the senior party, on application Serial No. 591,628, filed June 15, 1956. In issue is a single count copied from U.S. Patent No. 2,976,655, granted to the junior parties, Dreyfus et al. (Dreyfus), on an application filed August 20, 1959. The patent is assigned to W. R. Grace & Co., the application in suit is assigned to the Dow Chemical Co.

The count reads:

A method of forming a cover having an elastic edge comprising positioning a film of a high shrink energy polymer over and beyond the lip of a container, maintaining pressure on the film over the container, forcing the excess film downwardly around the container to form a gathered skirt and heating a band

of said skirt briefly to shrink the skirt and provide a gathered but relatively elastic edge.

The issues raised by this appeal are (1) whether Sternau can support certain limitations in the count; (2) whether Sternau's application complies with 35 U.S.C. 112; and (3) whether the count is new matter in the Sternau application.

As to the first issue, Dreyfus contends that Sternau cannot support the following limitations: (1) providing a relatively elastic edge; (2) positioning a film of a high shrink energy polymer; (3) forcing the excess film downwardly around the container; and (4) heating a band of said skirt briefly. We agree with Dreyfus as to Sternau's lack of support for the first limitation set forth above, and thus need not consider the other matters raised by this appeal.

Procedurally, this appeal comes to this court with this history. Dreyfus alleged no date earlier than the filing date of the senior party Sternau, and he was accordingly placed under order to show cause why judgment should not be entered against him. Dreyfus responded by moving to dissolve on the ground that the count is not supported by Sternau's disclosure, and that that disclosure is fatally defective in that it fails to comply with the requirements of 35 U.S.C. 112. This motion was denied by the Primary Examiner. Dreyfus thereupon requested that final hearing be set for consideration of matters set forth in his motion to dissolve. The Board of Patent Interferences held that Sternau could support all the material limitations in the count.

According to Dreyfus, the covers provided by the method of the count have a variety of uses including refrigerator dish covers, bathing caps, and tray-packed foodstuff covers. One method by which Dreyfus achieves a cover having a relatively elastic edge is described as follows:

In operating according to the invention the container is positioned on the turntable. The film of irradiated biaxially oriented polyethylene from 0.5 to 5 mils, e.g., of 3 mils thickness, is then positioned over the top of the container. The lever is then lowered until the upper portion of diaphragm engages the film. The diaphragm not only holds the film in place but it also evenly bends down the overlying edges of the film. The hot air blower is then started as is the turntable. The hot air forces the film in place against the sides of the container while at the same time the hot air also shrinks the film. As a result the film forms a thickened edge or bead * * * around the lip of the container. This thickened edge is usually about 5 to 10 times as thick as the film itself. As a result, an elastic edged cover for the container is formed. The cover can be removed to open the container and then can be applied again as a cover for the container due to its elasticity.

In describing the operation of a machine designed to provide covers for milk bottle hoods, TV dinner trays and the like, Dreyfus states:

After the downwardly blowing air has formed the shirred skirt then the cone is lowered further so that the lip or flange of the container rests on the circular impulse sealing ring, about ⅛ inch from the edge all around with the gathered film between the wire and the lip of the dish. The sponge applies slight downward pressure on top of the dish to maintain intimate contact all around. The impulse sealer is then operated, i.e. by heating, for 1¼ seconds at 450° F., to seal the wrinkles and shrink the film generally to provide a *gathered but relatively elastic edge*. [Emphasis ours.]

In still another portion of Dreyfus, the following is stated in describing the operation employed in making bathing caps from high shrink energy material:

A controlled amount of heat only should act on each disk of film material. Consequently, resistance wire after its original energization is almost immedi-

ately timed out by the action of the timing device. Time-out varies according to the thickness and nature of the film, but as an example, if the film be 1 mil thick irradiated polyethylene and the diameter of the ring of resistance wire be approximately 3¼ inches, time-out should occur after approximately 120 watt seconds have been released by the resistance wire.

Dreyfus defines the term "elastic" as follows: The term "elastic" is used in its popular sense as possessing the properties of extensibility and retractibility associated with vulcanized rubber.

Sternau relates to the provision of "a closure which is an inexpensive, simple hermetic seal for a container irrespective of whether the container is made of paper, plastic, aluminum, steel, etc." The closure may consist of either an inner component of a transparent oriented plastic sheet alone or in combination with an outer component of a semirigid, moldable material, such as aluminum, paper, plastic, glass, steel, etc.

The most pertinent portion of Sternau for purposes of this appeal reads as follows:

A closure may be made using an outer single-ply cover of aluminum, or paper, etc. as a retainer for a shrinkable plastic sheet, which is substantially larger than the mouth of the container. The plastic sheet is placed on top of the container, and the cover snapped onto the container. This will create the essential condition that the film is held flat across the mouth of the container, while the rim of the film is arranged around the rim of the container in pleats protruding beyond the outer cover. Thus, when heat is applied to the rim, the protruding film will shrink, conforming to the shape of the rim of the container and forming therewith a tight seal around said rim, while the remainder of the film is pulled tightly across the mouth of the container. This third method has the advantage that the outer cover can be removed without disturbing the seal of the film portion of the closure. *This process has the additional advantage that the outer cover can be repeatedly taken off and snapped back onto the container without losing its original efficiency of snapping onto the container, and locking below its rim due to its expandable, pleated rim.* [Emphasis ours.]

It will be noted that the foregoing passage describes a two-ply closure, the inner ply being of a shrinkable plastic sheet and an outer ply being of aluminum, paper, plastic, etc. Referring back to the count, it will be noted that it calls for a cover made of a film of a high shrink energy polymer. It is apparent that Sternau's outer ply, being of aluminum or paper construction, cannot possibly fit the description of a "film of a high shrink energy polymer." There is no dispute as to this. There is, however, some dispute as to whether the shrinkable plastic sheet, otherwise denominated by Sternau as a heat shrinkable, oriented material, is inherently a material having a high shrink energy. We will proceed on the assumption that the shrinkable plastic sheet does meet the limitation in the count as to a film of a high shrink energy polymer. Thus, it is with regard to the inner cover that Sternau, as copier of the claims from the Dreyfus patent, must establish support for the invention of the count.

Considering the above-quoted passage from Sternau further, it is noted that upon heating, the inner ply shrinks in such a manner as to form a tight seal around the rim of the container. Nothing is mentioned concerning the elastic properties of the inner ply in its shrunken state. The *outer cover* is stated to have an *expandable*, *pleated* rim, but it is not readily apparent from the application how this construction is achieved. In any case, it has no bearing on the construction of the inner ply, which is the one with which we must be concerned.

It is further noted that Sternau is completely silent in the passage under discussion, as well as throughout his disclosure, as to the specifics of his operating conditions. While Sternau's specification states that "heat may be applied by hot air, hot water, steam, electricity, or even by an open flame," no temperatures are given for the heating step; no mention is made as to the length of time the inner ply is subjected to heating conditions, and no specific materials are mentioned which fit the description of a shrinkable plastic sheet or a heat shrinkable oriented film. Moreover, there is no hint in Sternau that the inner ply should be capable of being removed and reapplied to the container which it seals. With the above in mind, we now turn to a consideration of the decisions below.

In reply to Dreyfus' motion to dissolve based on the contention that Sternau does not disclose forming a "gathered but relatively elastic edge," the Primary Examiner stated:

• • • however, • • • the Sternau specification points out that the film is arranged around the rim of the container "in pleats" and that heat is applied to the "rim" of the film to cause it to shrink into engagement with the rim of the container. Since the count is directed to a method, it is of no consequence that the pleating is done by an outside cover member. Also, since the cover material is a plastic film and since it shrinks to form a bead or raised edge around the container, it must inherently be "relatively elastic."

The Board adopted the Examiner's holding without elaboration.

Implicit in the Examiner's holding is the conclusion that Sternau does not expressly disclose a cover having a relatively elastic edge. We concur in this conclusion. However, we are not persuaded that there is sufficient ground for holding that Sternau's cover must inherently have an elastic edge. In Sternau, we are faced with an application completely devoid of specific teachings as to the crucial matters in question. Were there some indication of the specific materials employed, or the process conditions to which the broad class of materials are subjected, it might be possible to establish that the limitations in the count are inherently met. But in these matters the application is silent. Moreover, we cannot find in Sternau any indication that he desired an inner cover which could be removed and reapplied to the container. Such a teaching might provide a basis for an inference that the inner cover did in fact have a relatively elastic edge. No doubt, if such were within his contemplation, one of ordinary skill in the art could devise process conditions to achieve such a result. But that is not the criterion upon which the issue of inherency is resolved.

[1] By copying claims from an issued patent, and lacking express support for the limitations found therein, Sternau was faced with a twofold burden. First, one copying a claim from a patent for the purpose of instituting interference proceedings must show that his application clearly supports the count. *Jepson* v. *Coleman*, 50 CCPA 1051, 314 F.2d 533, 136 USPQ 647. There must be no doubt that an application discloses each and every material limitation of the claims and all doubts must be resolved against the copier. *Jepson* v. *Coleman*, supra; *Bierly* v. *Happoldt*, 40 CCPA 774, 201 F.2d 955, 96 USPQ 406. Second, where support must be based on an inherent disclosure, it is not sufficient that a person following the disclosure might obtain the result set forth in the counts; it must inevitably happen. *Crome* v. *Morrogh*, 44 CCPA 704, 239 F.2d 390, 112 USPQ 49.

There is of record an affidavit filed in behalf of Sternau, the pertinent averments of which read as follows:

> * * * that he has conducted and had conducted experiments with various heat shrinkable oriented films wherein film substantially larger than the mouth of a container has been laid across the mouth of the container, the periphery of the film has been arranged around the container and heat has been applied to the periphery to shrink the film and form a closure;
>
> * * * that he has found that all of the heat shrinkable oriented film tested, as described, produced a gathered pleated skirt extending downwardly around the container when the periphery of the film was arranged around the container;
>
> * * * that he has found that all of the heat shrinkable oriented film tested as described produced a closure having a gathered but relatively elastic edge permitting repeated removal and replacement of the closure on the container;
>
> * * * that, as a result of his experience and experimentation, he believes that any of the available heat shrinkable oriented films can be laid across and arranged around a container to form a gathered pleated skirt and will produce a closure having a gathered pleated skirt with a gathered but relatively elastic edge when the skirt is heat shrunk.

We make the following observations with regard to the affidavit. Affiant has not averred that the nine available heat shrinkable oriented films were tested. While *various* films were tested, how many or which particular ones we do not know. Nor do we know what process conditions were employed. While the first three averments are factual in expression, no data of any sort are presented. The fourth averment is clearly an expression of affiant's opinion.

[2] In our view, it would do violence to the well-settled principles regarding inherency to hold that Sternau's disclosure and affidavit contain sufficient evidence to warrant a finding that the material limitation in question is inherently disclosed. Both the disclosure and the affidavit are couched in the broadest of generalities, and it would require a bold *ipse dixit* on our part to decide the issue in question in Sternau's favor. This we will not do.

For purposes of deciding whether Sternau could support the limitation in the count "provid[ing] a * * * relatively elastic edge," we assumed arguendo that Sternau could support the further limitation "a film of a high shrink energy polymer." Turning to a consideration of the latter issue, we believe that this limitation is also not supported by Sternau.

[3] The count calls for use of a film of a high shrink energy polymer. It is undisputed that Sternau does not describe the inner ply in terms of shrink energy. Rather, the inner ply is described, inter alia, as a heat shrinkable, oriented film. Under the law of inherency, it is incumbent upon Sternau to establish that a heat shrinkable, oriented film necessarily has a high shrink energy.

The Examiner appears to have misconstrued the law of inherency. He found that since some of the materials disclosed by Dreyfus as *films of a high shrink energy polymer* were known in the art prior to Sternau's filing date, and since such films were also known as *shrinkable, oriented films*, the latter phrase, used by Sternau, would lead to the selection of a film of a high shrink energy polymer.

While apparently differing with the Examiner as to the proper test to apply, the Board agreed with the Examiner's holding that Sternau inherently supported the limitation in question.

The resolution of this issue actually turns on a relatively narrow point. Both parties agree that the description "a film of a high shrink energy polymer" does not include a film of low density, hot-blown polyethylene. The dispute arises as to whether the description heat shrinkable, oriented film, employed by Sternau, includes low density, hot-blown polyethylene. If it does, then one following Sternau's teachings *might select* low density, hot-blown polyethylene as a heat shrinkable, oriented film and thus provide a cover which is not a film of a high shrink energy polymer.

Sternau's evidence that low density, hot-blown polyethylene is not considered in the art as a heat shrinkable, oriented film consists in the main of averments in the affidavit discussed supra. The pertinent averments read:

> 10. that in film manufacturing and utilization industries the term "shrinkable film," as generally used, includes all nine of the commercially available shrink films;
>
> 11. that in the film manufacturing and utilization industries the terms "oriented film" or "shrinkable oriented film" are used to mean only those shrink films which have been subjected to special stretching, or other orientation processes, to induce a high degree of molecular orientation;
>
> 12. that, for example, while the low density polyethylene film in the chart[1] is produced by a blowing process which inherently produces a limited degree of molecular orientation and is therefore shrinkable, is not generally considered to be "shrinkable oriented film" but rather only "shrinkable film" since no special orientation process is utilized;
>
> * * * * * * *
>
> 14. that, as shown by the data in the Shrink Tension Range column of the chart on Properties of Shrink Films, the Dreyfus et al. limitation of "high shrink energy, e.g. 100 to 500 p.s.i.," includes all of the nine types of shrinkable film except low density polyethylene which is not considered to be an "oriented film";
>
> 15. that, the Sternau disclosure of a "shrinkable oriented film" would generally be understood in the film manufacturing and utilization industries to include all of the nine types of shrinkable film shown in the said chart except low density polyethylene;
>
> 16. that, therefore, the Sternau disclosure of a "shrinkable oriented film" is identical to the Dreyfus disclosure of "heat shrinkable oriented polymer" and to the limitation of "high shrink energy, e.g. 100 to 500 p.s.i."; and the disclosures of each application would lead persons of ordinary skill in the film manufacturing and utilization industries to use the same types of shrinkable film.

Arrayed against this evidence is page 488 of Modern Plastics Encyclopedia (1964 ed.) which reads in pertinent part:

> In general, however, blown film is characterized by good physical properties and gives a film that is equally oriented with and across the direction of extrusion (thereby producing some increase in strength). This orientation, although it is not great, can also cause the film to shrink on heating, for possible use in shrink packaging applications.

In view of the burden imposed upon Sternau (as copier of the claim constituting the count from the Dreyfus patent, we are not persuaded that the limitation as to a film of a high shrink energy polymer is inherently supported by Sternau. The foregoing passage from "Modern Plastics" indicates that low density, hot-blown polyethylene is both heat shrinkable and oriented, the latter albeit to a lesser extent than other types of oriented films. The fact that the orientation is not great may mean that it is not a preferred film for shrink packaging but this is immaterial. Moreover, the Lowry article cited by Sternau indicates that low-density polyethylene is used for shrink packaging. Thus, we are not sufficiently convinced that low density, hot-blown polyethylene is not considered by those in the art to be a heat shrinkable, oriented film.

---

[1] The chart, which sets forth data on properties of shrink films, appears in an article by Robert D. Lowry in Modern Plastic Packaging Encyclopedia 223 (1963 ed.).

We think it is apparent from the foregoing that Sternau has not discharged the burden which the law imposes on one in his position. Accordingly, the decision of the Board of Patent Interferences is reversed.

REVERSED.

MARTIN, *J.*, concurring, with whom SMITH, *J.*, joins.

I am unwilling to assume that Sternau discloses a high shrink energy polymer in deciding whether he can support the limitation of a "relatively elastic edge." As I see it, if we make that assumption, a "relatively elastic edge" inherently must be formed in Sternau.

However, I agree with the majority that Sternau cannot make the limitation "a film of a high shrink energy polymer." In my view, an analysis of the facts relating to that limitation shows the Board erred in failing to appreciate the distinction between the types of polymers called for in Dreyfus by the above limitation as against the polymers Sternau contemplated under such terms as "shrinkable oriented films" and "transparent oriented plastic sheet." I make no intimation as to what Sternau in fact may be entitled.

U.S. Court of Customs and Patent Appeals

M.K.M. KNITTING MILLS, INC. *v.* DAMON CREATIONS, INC.

No. 7638. Decided April 7, 1966

[53 CCPA —; 357 F.2d 997; 149 USPQ 222]

1. TRADEMARK—CONFUSING SIMILARITY—DISTINCTION BETWEEN WELL-KNOWN NAME AND COINED WORD—*In re General Electric Co.* CONSTRUED.

"Appellant relied quite heavily on our reasoning in *In re General Electric Co.*, 49 CCPA 1186, 304 F.2d 688, 134 USPQ 190 (1962), wherein we held confusion unlikely between the simple word marks VULCAN and VULKENE, pointing out that VULCAN is a well-known name, hence familiar to the American people, whereas VULKENE has the characteristics of an arbitrary coined word. We felt that people would readily distinguish between the familiar and the unfamiliar and would not be confused by reason of the obvious similarities between the two marks.

2. SAME—SAME—"DAR MEN" AND "DAMON" FOR MEN'S WEAR.

Upon considering the decision of the Trademark Trial and Appeal Board cancelling the appellant's registered mark "dar men" in view of the appellee's registered mark "DAMON," both marks being for men's wear, where it was found that "Appellee does not dispute that DAMON is a common surname" and the court concluded that "the marks are not reasonably susceptible to similar pronunciation" nor that they look alike, *Held* that "We think the principles we applied in the *General Electric* case apply here and therefore the decision of the Board is reversed."

APPEAL from the Patent Office. Cancellation No. 8,153.

REVERSED.

Oliver C. Morse for appellant.

Russell L. Law for appellee.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, Jr., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

RICH, *Acting Chief Judge*, delivered the opinion of the court.

This appeal is from the decision of the Trademark Trial and Appeal Board (abstract 144 USPQ 777) granting appellee's petition to cancel trademark Registration No. 747,904, issued April 9, 1963, on the

Principal Register, of the following mark for shirts, swimsuits and sweaters for men:

Petitioner-appellee relied on three Principal Register registrations: No. 684,827 of Sept. 8, 1959, for a composite mark with design including a pair of theatrical masks and the words "OFF-BEAT by damon"; No. 717,628 of June 27, 1961, for the work mark DAMON; and No. 721,064 of Sept. 5, 1961, for the word mark BY DAMON CREATIONS. The goods in the first-named registration are men's neckwear and the goods named in the other two are inclusive of the goods named in appellant's registration. There is no issue as to appellee's priority. The sole issue, therefore, is whether concurrent use of appellant's mark and any one of appellee's marks would be likely to create confusion, mistake, or deception. Trademark Act of 1946, section 2(d), as amended (15 U.S.C. 1052(d)).

Neither party took testimony. Both parties briefed and argued the case in this court. Appellee relies only on the "Damon" portions of its registered marks.

[1] Appellant relied quite heavily on our reasoning in *In re General Electric Co.*, 49 CCPA 1186, 304 F.2d 688, 134 USPQ 190 (1962), wherein we held confusion unlikely between the simple word marks VULCAN and VULKENE, pointing out that VULCAN is a well-known name, hence familiar to the American people, whereas VULKENE has the characteristics of an arbitrary coined word. We felt that people would readily distinguish between the familiar and the unfamiliar and would not be confused by reason of the obvious similarities between the two marks. The argument is, of course, that the same is true as between the mark "dar men" and the mark DAMON, the latter being the common name.

Appellee does not dispute that DAMON is a common surname. It is argued, however that "Darmen * * * *looks* like a name * * *." Appellee supports this proposition by allegedly finding a Darman in the Boston Telephone Directory (not of record) and a Darmon in the St. Louis Telephone Directory (not of record). It overlooks, however, the form of appellant's registered mark, which does not look like a name and, moreover, ends in "men."

The "hard core of appellee's complaint in this proceeding," says its brief, is that "dar men" and DAMON would probably be pronounced alike, at least in certain areas of the country. The theory is rather finely spun and we think it would have to be to arrive at such a conclusion. It involves the premise that some New Yorkers and eastern New Englanders do not pronounce their "r's" in certain words. While that may be true, we do not see its application to the present fact situation. As appellant points out, the name Damon is in the dictionary and its pronunciation is given with a long "a," with the sound of the word "day." We think it would not be likely to be pronounced otherwise. We also think that even people who drop their "r's" would not pronounce "dar men" with the "day" sound. Even without the "r" sound, the presence of the "r" calls for pronunciation of the "a" as *ah*. Therefore we conclude, contrary to the Board, that the marks are not reasonably susceptible to similar pronunciation.

We also are constrained to disagree with the Board that the marks look alike. In saying that they do, the Board opinion merely compares "Damon" and "Darmen"—typed just so—ignoring the design features of the mark as shown in the registration sought to be cancelled and reproduced above. We regard the design as a limitation of the registration which should be given some effect and which appears to have been ignored.

[2] We think the principles we applied in the *General Electric* case apply here and therefore the decision of the Board is reversed.

REVERSED.

MARTIN, *J.*, dissenting, with whom KIRKPATRICK, *J.*, joins:

The goods of the parties overlap. The spelling and appearance of the marks are highly similar, and the sound even more so. When the marks are considered, each in its entirety and removed in time and distant in place, it is clear to me that their concurrent use would be likely to cause confusion, mistake, or to deceive. This is particularly true since the marks can be used in speech. Appellant has not persuaded me of clear error in the Board's decision, and thus I would affirm.

PLANT PATENTS

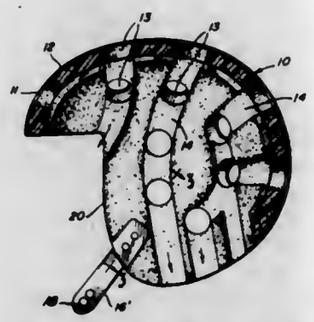
GRANTED SEPTEMBER 27, 1966

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

2,672
AZALEA PLANT
Henry W. Motzkau, Whitewater, Wis., assignor to Yoder Brothers, Inc., Barberton, Ohio, a corporation of Ohio
Filed Mar. 19, 1965, Ser. No. 441,387
1 Claim. (Cl. Plt.—57)

A new and distinct variety of azalea plant characterized as to novelty by its earliness to bloom without artificially inducing dormancy, vigorous plant growth, the strong to deep purplish pink color of its blooms, its readiness to set buds, good formal appearance, and good keeping qualities.

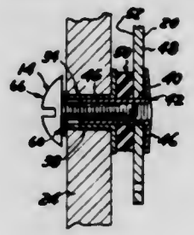
2,673
ROSA FLORIBUNDA PLANT
Edward Burton Le Grice, North Walsham, Norfolk, England
Filed July 15, 1965, Ser. No. 472,375
1 Claim. (Cl. Plt.—24)



The new and distinct variety of Rosa floribunda plant herein shown and described.

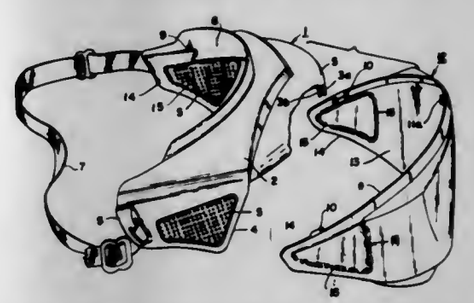
PATENTS

GRANTED SEPTEMBER 27, 1966



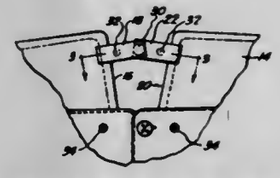
GENERAL AND MECHANICAL

3,274,612
HELMET FOR WATER SPORTS
Robert C. Merriam, 2222 Alice St., Santa Cruz, Calif.
Filed May 18, 1965, Ser. No. 456,621
4 Claims. (Cl. 2—3)



1. A safety helmet for use in water sports comprising:
a protective head-shaped shell;
a flexible liner attached to the inner surface of said shell, said flexible liner and said shell each being provided with a plurality of aligned openings therethrough; and
a network of drain channels extending from said aligned openings along the inside surface of said flexible liner to the edge of said safety helmet thereby permitting the escape of water entrapped inside said helmet.

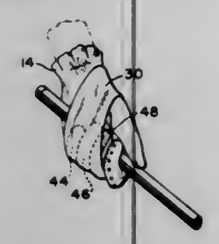
3,274,613
PIVOTING FACE GUARD ASSEMBLY
Theo J. Sowle, 2525 Martin Ave., Grand Rapids 7, Mich.
Filed Feb. 3, 1964, Ser. No. 342,201
3 Claims. (Cl. 2—9)



1. A pivoting face guard assembly for mounting in aligned holes in the opposite side walls of a protective helmet, said assembly comprising
an approximately U-shaped face guard having a central face-protecting portion disposed forwardly thereof and having opposite laterally-spaced side arms extending rearwardly from the opposite ends of said central portion,
said side arms near their rearward ends having a pair of aligned holes therethrough adapted to be aligned with the aligned holes in the helmet side walls;
and a pair of pivotal face guard connectors,
one face guard connector being mounted in each of said pair of aligned side arm holes:
each pivotal connector including
a headed threaded inner fastener having a tubular internally-threaded shank adapted to be inserted through and extend outwardly from one of the aligned helmet side wall holes and having means thereon adapted to engage the helmet side wall in rotation-preventing relationship therewith,
a tubular spacer disposed in one of said face guard side arm holes in telescoped relationship with said inner fastener and having an axial length substantially equal to the thickness of its respective face guard arm,
and a headed threaded outer fastener having an externally-threaded shank extending through said spacer into threaded engagement with said inner fastener and with its head having an abutting connection with said spacer.

3,274,614
HEADSHIELD
Charles J. Boyer, Reading, Pa., assignor to The Electric Storage Battery Company, Philadelphia, Pa.
Filed Oct. 7, 1964, Ser. No. 402,216
3 Claims. (Cl. 2—14)

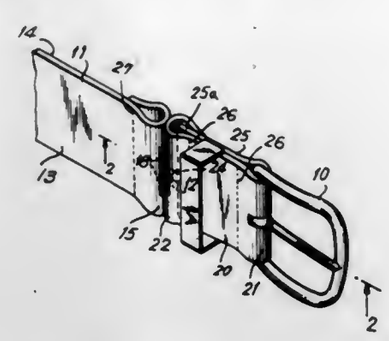
1. A headshield comprising a front portion adapted to be spaced from and surround the forehead of the wearer, a vertical slot formed on the bottom and extending along the perimeter of said front portion and terminating in arcuate cut-out portions at the ends of said slot said slot being defined by a front and rear wall, and a protective element having a top rim portion inserted in said slot and having stud elements at the ends of the rim portion detachably engaging said cut-out portions to provide a pivotal connection therewith, and means latching the intermediate portion of said rim portion to said headpiece.



3,274,615
COLLAR CONSTRUCTION FOR SHIRTS
Wendell H. Piehler, Box 11, New London, N.H. 03257
Filed Dec. 21, 1964, Ser. No. 419,994
2 Claims. (Cl. 2—141)

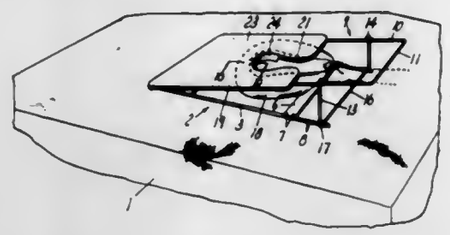
1. In a shirt having an attached tab collar which has an inner fold and an outer fold, the outer fold forming a turn-down portion having two opposed ends which are spaced in front of the shirt to define a necktie receiving space, the combination therewith of a pair of tabs having a first position at which the opposed ends are detachably

connected and having a second position at which each of said tabs is secured to the inner fold at a position adjacent the corresponding end and hidden from view, each tab being connected at one end to the inside of the outer fold adjacent a corresponding end of the outer fold, the other end of said each tab extending to the front center of the collar across the necktie receiving space, a first snap fastener having male and female portions respectively carried by the free ends of said tabs, and second and third snap fasteners, one associated with each tab, each second and third fastener having male and female elements, one of said elements being attached to the corresponding tab at a point intermediate the ends thereof, the other of said elements being secured to the inner fold adjacent the corresponding opposed end of the outer fold but hidden from view, all of said fasteners having alternative locked and open positions, whereby said shirt is adapted to be worn with a tie when said tabs are in the first position and the opposite ends are connected and the fasteners are secured in locked position and whereby said shirt is adapted to be worn open neck without a tie when said tabs are in the second position and at least said first fastener is in the open position.



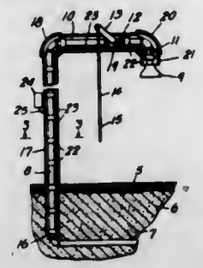
3,274,616
GRIP LOCKING GLOVE ASSEMBLY
Allie Russo, 488 Maywood Ave., Maywood, N.J.
Filed Oct. 14, 1965, Ser. No. 495,830
3 Claims. (Cl. 2—161)

1. A grip locking glove assembly adapted to compel the wearer to retain a firm grip upon the shaft of a golf club when the hands are gripping the club shaft, comprising a glove assembly positioned on a hand of the wearer, said glove assembly including a glove and a swatch of fastening material attached to the back thereof, a resilient band assembly including a band having a mating attachment on one end detachably secured to the swatch of fastening material, said band being wrapped completely around the glove and hand, a second mating attachment on the opposite end of said band detachably fastening into the swatch to hold the gloved hand firmly about the shaft of the golf club.



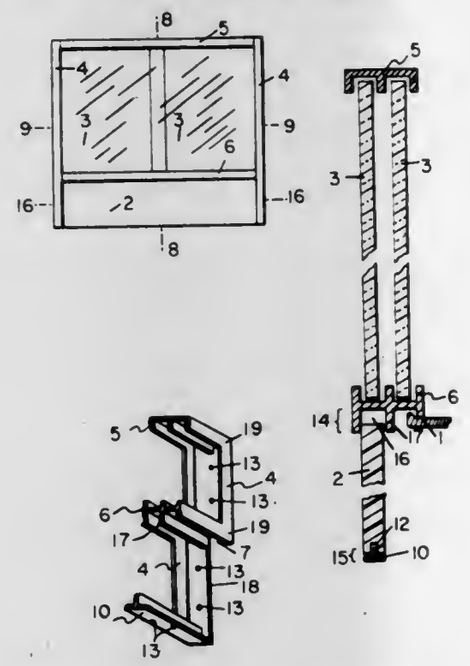
3,274,617
BELT STRUCTURE HAVING SWIVEL MEANS
Leon Krantz, Jamaica, N.Y., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed May 6, 1965, Ser. No. 453,699
2 Claims. (Cl. 2—301)

1. A belt comprising a body circling portion and a buckle carrying portion, a loop formed adjacent one end of said body encircling portion, an aperture formed in said loop, a rivet member having a shank passing through said aperture and having leg portions disposed within said loop, said leg portions being laterally spaced apart to prevent relative rotation of said rivet member and body encircling portion, a circular head on said rivet member spaced from said legs, a short length of material of substantial thickness having a buckle fixed at one end and having a bight portion at the other end, a second aperture formed in said bight portion, said shank of said rivet member passing through said second aperture and said circular head of said rivet member lying adjacent said second aperture, an end portion of said short length of belting material being disposed adjacent the head of said rivet member, thereby to space apart the portions



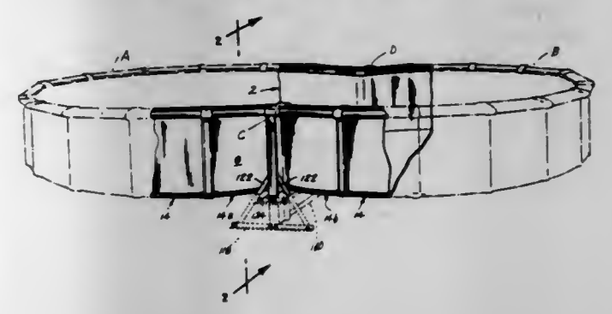
of said short section defining said bight, and fastening means passing through said portions defining said bight and said end portion.

3,274,618
BODY SUPPORTING APPARATUS
Mary Kahllo, 620 W. Paterson St., Kalamazoo, Mich.
Filed Oct. 24, 1963, Ser. No. 318,664
6 Claims. (Cl. 4—112)

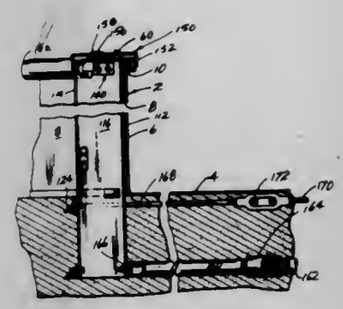


1. A body supporting apparatus adapted to be positioned on a supporting surface and comprising, a base member formed of rod stock having laterally spaced substantially parallel side bars fixedly connected at their front ends by a crosspiece aligned therewith, a rear crosspiece fixedly secured to said side bars adjacent to but in forwardly spaced relation to their rear ends, the side bars at the rear of said crosspiece having a plurality of upwardly facing notch like keepers, an adjustable body support member formed of rod stock and comprising a pair of laterally spaced and substantially parallel side bars connected at their rear ends by a crosspiece said support member side bars having eyes at their front ends pivotally engaging said crosspiece at the front end of said base member, said support member side bars being of a length substantially exceeding the length of said base member side bars and having offsets therein spaced forwardly from said handle, an upwardly facing U-shaped supporting strut for said body support member, the arms of which terminate in eyes hingedly engaged with said offsets of said support member side bars, its bight portion being inwardly offset and being selectively engageable with said keepers on said base member side bars when the support member is in erected position, said strut being adjustable to erected and to a collapsed position in which it is mainly disposed between said base member and said support member, and a user supporting panel supportedly and detachably mounted on said body support member side bars with portions thereof projecting laterally therefrom, said supporting panel terminating at its rear end in forwardly spaced relation to said strut and having an opening therein extending forwardly from its rear end, and having means facilitating the positioning of a bedpan relative to said opening.

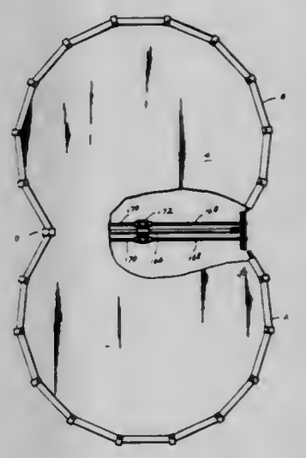
3,274,619
EMERGENCY SHOWER
Hans Rolfes, Bronx, N.Y., assignor to Trans Continental Electronics Corp., New York, N.Y., a corporation of New Jersey
Filed Apr. 2, 1964, Ser. No. 356,831
4 Claims. (Cl. 4—145)



1. An emergency shower comprising a shower head in predetermined position above an outdoor ground slab, means for supplying water to said shower head, said means comprising a supply line submerged a frost safe distance below said ground slab, a riser extending upwardly from said supply line and coupled with a horizontal pipe extending to said shower head through a depending pipe, said first named means including a manually actuated valve controlling discharge of water from said shower head, a casing completely enveloping the riser, the horizontal pipe and the depending pipe extending to the shower head, interconnected induction heating coils mounted on and spaced longitudinally of the riser horizontal pipe and depending pipe, a thermostat controlling said coils, and insulating material in said casing around said coils, riser, horizontal pipe and depending pipe.

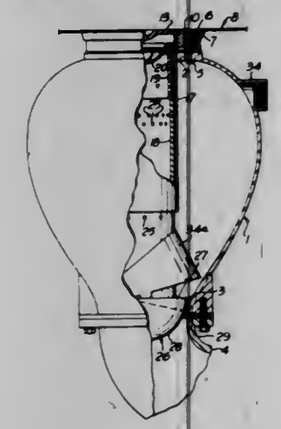


3,274,620
BATHING ENCLOSURE AND RECEPTACLE
Russell W. Smith, Jr., Arlington, Va.
(2403 Holt St., Vienna, Va. 22180)
Filed Aug. 26, 1963, Ser. No. 304,312
5 Claims. (Cl. 4—149)

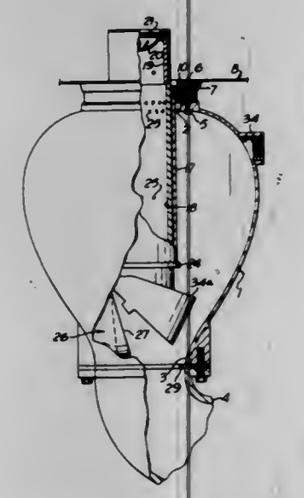


1. A bathing receptacle and an enclosure, in combination, comprising a bathtub having generally vertical walls, and a horizontal flange member located at the end portion of one of said vertical walls and integral therewith, and an enclosure consisting of a plurality of panel members held in place by a plurality of related framing members, one of said framing members being substantially horizontal and coextensive in length with said horizontal flange member of said bathtub, and having a flange coextensive in length with said framing member for matingly overlapping said horizontal flange member of said bathtub to thereby produce a water tight joint, said horizontal framing member having upper and lower supporting surface portions, said upper supporting surface having disposed therein at least one of said panel member that extends upward as a shower shield, said lower supporting surface having disposed therein at least one of said panel members extending downward from said horizontal framing member substantially to the floor.

3,274,621
WATER-RETAINING RECREATIONAL STRUCTURE FOR SWIMMING POOLS AND THE LIKE
Joseph Diemond, Simsbury, and Melvin Y. Gershman, West Hartford, Conn., and Henry L. Sundberg, Jr., and Norbert A. Vangmess, Longmeadow, Mass., assignors to Coleco Industries, Inc., Hartford, Conn., a corporation of Connecticut
Filed Dec. 27, 1965, Ser. No. 516,287
21 Claims. (Cl. 4—172)



1. A water-retaining, above ground prefabricated recreational structure adapted to be disassembled and having a curvilinear peripheral configuration defined by a plurality of generally circular components intersecting at apices, the chords extending between said apices being of lesser length than the diameter of the intersecting circular components, said recreational structure having a liner member of flexible, relatively waterproof sheet



material providing a bottom wall portion and a side wall portion extending about the periphery of said bottom wall portion; a relatively rigid, generally vertical support panel extending about the periphery of said liner side wall portion and closely adjacent thereto to provide a relatively rigid horizontal support therefor in said curvilinear peripheral configuration; a plurality of elongated horizontal support members extending in end-to-end relationship about said liner member in said curvilinear configuration; vertical support members at said apices between said circular components extending vertically of the outer surface of said support panel; coupling means engaging the adjacent ends of horizontal support members with said vertical support members at said apices to provide a firm assembly thereof with said horizontal support members diverging outwardly from said vertical support members; and means at said vertical support members compensating against pressures thereon.

3,274,622
HOUSEHOLD AND OTHER REFUSE STORAGE AND DISPOSAL APPARATUS

Douglas Michael Venison, Billericay, Essex, and John James Pite, West Wickham, Kent, England, assignors to Matthew Hall & Co. Limited, London, England, a corporation of the United Kingdom

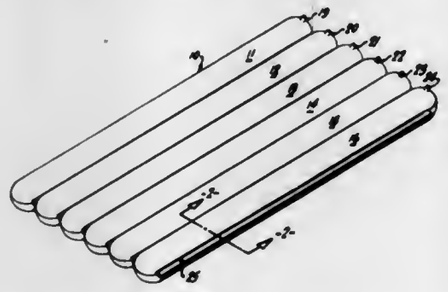
Filed Nov. 21, 1963, Ser. No. 325,311
11 Claims. (Cl. 4—287)

1. A refuse storage and disposal unit of the kind adapted to be fitted to a kitchen sink, comprising an outer chamber for receiving waste liquid, said outer chamber having an inlet opening for connection to said sink outlet and an outlet opening for connection to the pipework of a disposal plant, valve means for normally preventing the escape of liquid through said outlet opening and for retaining a quantity of liquid in said outer chamber, an open ended cylinder arranged for communication with said inlet opening to receive both waste liquid and solid refuse, apertures formed in said cylinder to allow the bulk of said waste liquid to pass therethrough into said outer chamber, closure means associated with the lower end of said cylinder for normally retaining said solid refuse therein, and means for actuating said valve means and said closure means so as to release said solid refuse simultaneously with said waste liquid so that it falls through said outlet opening to effect disposal thereof.

3,274,623
PILLOW CASES

Charles A. McCarthy, 342 Beach 40th St., Far Rockaway, N.Y.

Continuation of application Ser. No. 300,139, Aug. 2, 1963. This application Oct. 12, 1965, Ser. No. 495,205
3 Claims. (Cl. 5—339)

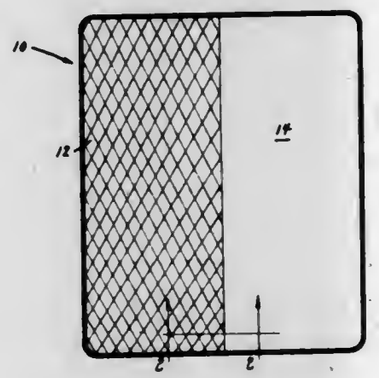


1. A combination pillow case and pocket construction adapted to be turned inside-out for use on a pillow, wherein one wall of a pocket comprises a relatively small right-triangular two-ply sheet of fabric consisting of a doubled-back rectangular sheet doubled back along a diagonal fold line and the pillow case consists of a doubled back relatively large rectangular sheet of fabric doubled back along a median fold line through the longitudinal edges of the sheet thereby providing opposed pillow case walls, said pocket wall being mounted in a corner of the doubled-back pillow case sheet opposite said fold line thereof with the mutually right-angle edges of the pocket wall plies positioned between the corresponding mutually adjacent edges of the pillow case walls and said pocket wall positioned wholly between said pillow case walls, and stitching extending along the length of and through said edges of the pillow case walls and hence also through said edges of said pocket wall plies.

3,274,624
INFLATABLE AIR MATTRESS

Claude J. Noerdinger, 3825 Rumford St., Palo Alto, Calif.

Filed Apr. 28, 1964, Ser. No. 363,105
5 Claims. (Cl. 5—345)



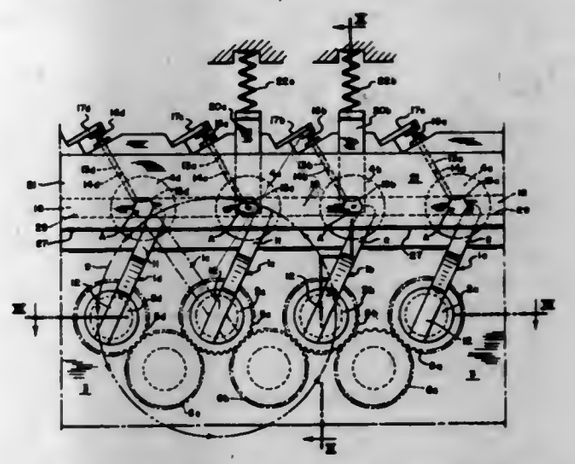
1. A resilient mattress, comprising a plurality of longitudinally extending cells disposed in side by side relation and being releasably interconnected along adjacent longitudinal surface portions thereof to enable cells to

be interchanged one for another and also to enable the transverse dimension of the mattress to be selectively altered, said cells being respectively equipped along each of such longitudinal surface portions thereof with fastener structure for effecting such releasable interconnection of said cells, and the fastener structures carried by any one cell along the respective longitudinal surface portions thereof being complementary and having cooperative elements interlockingly connected with the corresponding elements of the associated fastener structure of the cell adjacent thereto, said cooperative elements being resistive of separation tending to be enforced thereon by application of force thereto in the general plane of said mattress but being susceptible of ready separation by application of force thereto in a direction generally normal to such plane, each pair of interlocking connected fastener structures being disposed intermediate the edges of the cells corresponding to the top and bottom of said mattress and each such pair of connected fastener structures defining with the associated cells and I-beam-type configuration in which the adjacent cells are spaced from each other by the intervening fastener structure, such interconnected fastener structures in cooperation with the associated cells being effective to stiffen the mattress as well as interconnect the cells.

3,274,625
MATTRESS

Hendrix W. Metzger, R.R. 2, Boonville, Ind.

Filed June 21, 1965, Ser. No. 465,564
5 Claims. (Cl. 5—345)



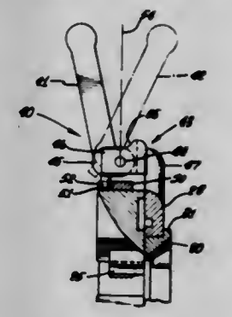
1. A mattress defining a body supporting surface comprising a cover assembly having one portion thereof quilted to present one firmness and another portion thereof unquilted to present a different firmness.

3,274,626
TRANSFER MEANS FOR MACHINE FOR MAKING BOLTS, NUTS AND THE LIKE

Gerardus C. van de Meerendonk, Helmond, Netherlands, assignor to Nedschroef Octrooi Maatschappij, N.V., Helmond, Netherlands, a limited-liability company of the Netherlands

Filed Dec. 10, 1963, Ser. No. 329,428
Claims priority, application Netherlands, Dec. 10, 1962, 286,483
15 Claims. (Cl. 10—12)

1. In a machine for forming articles of the type including a stationary die for receiving a workpiece, a reciprocable tool carrier movable toward and away from the die for pressing workpieces in the die, and a transfer mechanism for moving a workpiece into a position in front of the die, the improvement in which the transfer mechanism comprises a workpiece-guiding means located adjacent the die for guiding the workpiece along a path to a position in front of the die, and a continuously rotatable transfer arm mounted in a position with respect to the die such that its projecting end portion moves along the guiding means to engage a workpiece carried thereby and move the workpiece into a position in front



of the die where the transfer arm leaves the workpiece in a position to be pushed into the die and continues in its rotation.

3,274,627
RAPID INDEXING OF PIPE THREADING APPARATUS

Howard N. Behnke, South San Gabriel, Calif., assignor to Collins Machinery Corporation, Monterey Park, Calif., a corporation of California

Filed Jan. 2, 1964, Ser. No. 335,022
4 Claims. (Cl. 10—96)

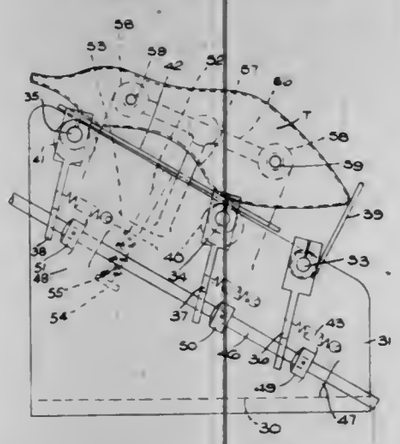
1. In pipe threading apparatus of the character described, an assembly including

(a) a housing member forming a central through opening to receive pipe extending generally horizontally for rotation about a first axis,

(b) a series of thread chaser units carried by the housing, said units disposed about said first axis for cutting presentment to the pipe,

(c) a body member forming a pipe receiving opening and carrying a series of cams spiraling about said first axis and located to effect simultaneous inward advancement or outward retraction of said chaser units upon relative rotation of the housing and body members about said first axis, the body member carried on the housing member,

(d) a latch including a handle carried to freely project outwardly away from said first axis at the exterior of said housing and body,

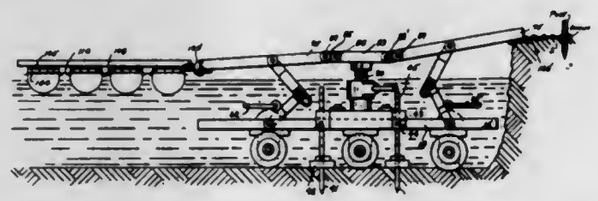


(e) connecting means including a pivot connecting the latch to said body member for free and unrestricted rocking of the latch about a second axis and between a primary position in which said body member may be freely rotated relative to the housing member in response to force applied to the handle in a direction generally normal to the direction of handle rocking, and a limited number of secondary positions in each of which relative rotation of said members is blocked,

(f) said handle in said primary and secondary positions being tilted at opposite sides of a vertical plane extending generally normal to said first axis and containing said second axis thereby to develop gravity bias acting to retain the handle in either of said positions,

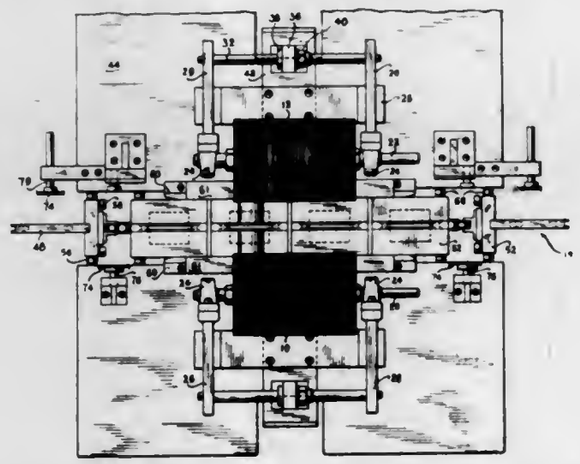
(g) indexing means carried by the housing member and forming a series of latch engagement shoulders spaced about said first axis to be selectively engaged by the latch in said secondary positions and disengaged by the latch in said primary position, the spacing of said shoulders being predetermined to correspond to the selected diameter pipe threads to be formed by said chaser units,

(h) and means for supporting said housing member so that the latch handle projects generally upwardly in each of the primary and secondary positions to be assumed by the latch, said support means including a support pivot at one side of said first axis and a downwardly received holder at the opposite side of said axis to transmit the weight of said assembly, said holder being liftable to rotate the assembly upwardly about said support pivot, said holder and pivot being generally horizontally spaced apart.



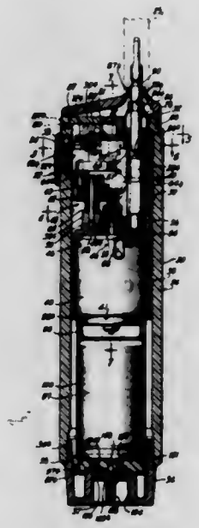
3,274,628
MANUFACTURE OF SHOE COMPONENTS
George Trevor Ralphs, Oadby, England, assignor to The Ralphs Engineering Company Limited, Leicester, England
Filed May 31, 1962, Ser. No. 198,989
4 Claims. (Cl. 12—146)

1. A method of producing pre-finished outsoles for shoes or shoe bottom units, wherein a plurality of sole blanks are superposed one upon another and held together in a stack, and, all while held together in the stack, the blanks are subjected to an edge trimming operation to produce the required edge contour on the blanks, any loose particles are removed from the trimmed edges, and afterwards, while the blanks are still held together in the same stack, the blanks are subjected to an inking operation to produce the required finished edge on the blanks.



3,274,629
PORTABLE JACK PIER
Mary E. Gearon, 4523 W. Adams St., Chicago, Ill. 60624, and Joseph B. Lindecker, Skokie, Ill. (53 W. Jackson Blvd., Suite 1657, Chicago, Ill.)
Filed Mar. 13, 1964, Ser. No. 351,728
9 Claims. (Cl. 14—71)

1. An adjustable portable jack pier for use with pontoon bridges consisting of a plurality of floats each embodying an inflated envelope having a normally flat rectangular surface region and a region normally arcuate in cross-section and a platform supporting frame secured to the upper portion of said envelope, and stringers mounted upon the supporting frames of a plurality of floats; the pier comprising a main frame having a front section, a rear section and a central section located midway between the ends thereof, said central section embodying a frame structure with a top supporting surface arranged in a plane above but parallel to the plane of said main frame, a jack housing mounted upon and secured to said top supporting surface, a threaded thrust bar extending through said housing, means within said housing for actuating said thrust bar including a manually rotated shaft, crank means outside said housing for rotating said shaft, an operating platform mounted upon the upper end of said thrust bar, central stringers secured to the sides of said platform, a pair of front stringers pivotally mounted with the front end of said operating platform



and extending above said front section, a pair of rear stringers pivotally mounted with the rear end of said central stringers on said operating platform and extending above said rear section, supporting members pivotally connected with said front and rear stringers intermediate the ends thereof and adjustably supported upon said main frame adapted to elevate the free ends of said stringers relative to the elevation of said central stringers on said operating platform, a plurality of axle housings secured to and extending below said main frame, an axle mounted in each pair of said housings, arranged transversely of the frame, each axle supporting a pair of wheels journalled for rotation thereon adapted to make said main frame mobile, vertical adjustable means for supporting said frame, and means for connecting the rear end of said rear section with an anchoring element on the shore.

3,274,630
BRUSHING MACHINE
Hovav Mileikowsky, Norwalk, Carl Horvath, Fairfield, and Saul Rosner, Norwalk, Conn., assignors to Burndy Corporation, a corporation of New York
Filed Mar. 11, 1965, Ser. No. 439,022
9 Claims. (Cl. 15—21)

1. A machine for scouring the opposed surfaces of a plurality of separate articles, comprising: a pair of opposed scouring members defining a passage therebetween; means for rotatably supporting said articles with the opposed surfaces thereof in exposed position; means for transporting said supporting means through the passage between said scouring members with the opposed surfaces of said articles in operative engagement with said opposed scouring members; and means including said rotatably supporting means for rotating said articles about an axis extending between said opposed surfaces during transport between said opposed scouring members.

3,274,631
ELECTRIC CORDLESS TOOTHBRUSH
Albert R. Spohr, Park Ridge, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Mar. 20, 1964, Ser. No. 353,327
14 Claims. (Cl. 15—22)

2. A power unit for an electric toothbrush comprising a generally cylindrical casing having an open end and a closed end, means defining an opening in said closed end, a subassembly adapted to be inserted into said casing through said open end, said subassembly comprising an electric motor, a driving mechansim, an electric switch and support means, a housing for said motor open at one end, said support means comprising a mechanism support for said driving mechanism, said support means including a lower portion closing the open end of said motor housing and an elongated U-shaped upper portion, said U-shaped upper portion being generally concentric with said cylindrical casing, an output drive shaft drivingly connected to said motor through said driving mechanism adapted to extend through said opening upon insertion of said subassembly into said casing, and means for closing the open end of said casing.

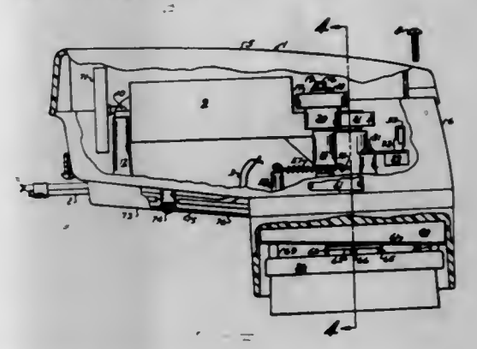
3,274,632
SHAMPOOING AND SCRUBBING DEVICE
Edmond G. Franklin, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Filed Dec. 28, 1964, Ser. No. 421,538
3 Claims. (Cl. 15—29)

1. A hand held and manipulatable scrubbing device comprising;

(a) a casing, said casing having a handle portion dimensioned to be easily grasped in a person's hand,

(b) a shaft having a first end portion rotatably mounted on said casing and a second end portion projecting from said casing,

(c) scrubbing means mounted on said second end portion of said shaft,

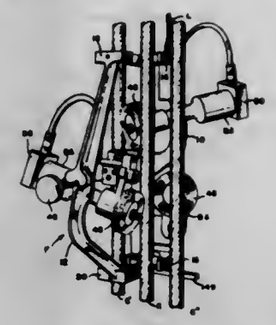


(d) sponge type foam generating means including a sponge mounted on said device and abutting against said casing adjacent said scrubbing means,

(e) self-priming positive displacement type of pump means on said device, said pump having an inlet and an outlet,

(f) said pump inlet being adapted to be connected to a liquid supply receptacle separate from said device,

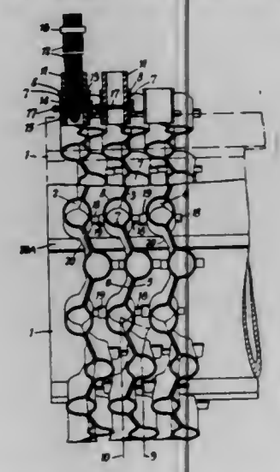
(g) said pump outlet being positioned in contact with said sponge of said sponge type foam generating means between said sponge and said casing,



(h) driving means mounted within said casing for rotating said shaft and operating said pump and said foam generating means,

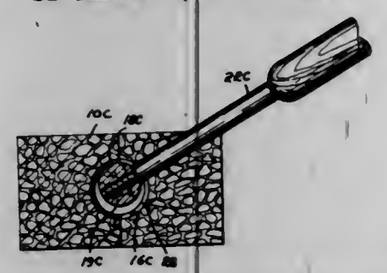
(i) and finger operated control means on the exterior of said casing adjacent said handle portion for selectively starting and stopping delivery of liquid from said pump to said foam generating means through said pump outlet,

(j) whereby liquid under pressure is selectively supplied to said foam generating means by operation of said control means and the location of said pump outlet in contact with said sponge between said casing and sponge provides active foam generation when said device is used to scrub vertical and sloping surfaces as well as horizontal surfaces.



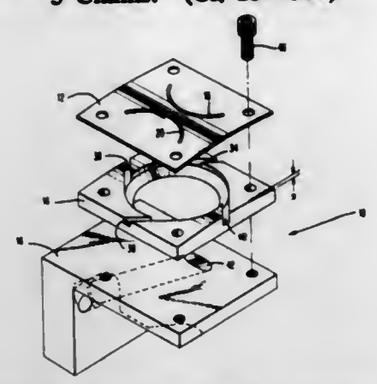
3,274,633
PORTABLE POWER CABLE CLEANER
Clair V. Stevenson, Seattle, Wash., assignor to Cable-Clean Corporation, Seattle, Wash., a corporation of Washington
Filed Apr. 6, 1965, Ser. No. 445,993
24 Claims. (Cl. 15—88)

24. A cable cleaning mechanism comprising: a frame; a plurality of brush assemblies, each including a rotary, bristle brush and an air motor for rotating said brush; means mounting said brush assemblies onto said frame at different locations circumferentially about the cable position, so that the brushes contact the cable at circumferentially spaced locations thereon, said means permitting yieldable engagement of the bristle brushes with said cable; an air cylinder means connected with each said brush assembly for urging same toward the cable, and in that manner urging the bristle brush of such assembly into contact with the cable; a source of compressed air; conduit means for delivering compressed air from said source to each air motor and to each air cylinder means; and pressure control means in said conduit means for main-



taining sufficient air pressure in said conduit means for actuating the air cylinder means during air delivery to the air motors.

3,274,634
ROTARY BRUSHES AND COMPONENTS FOR USE IN ROTARY BRUSHES
Leonard Robert Godfrey, Chepstow, England, assignor to Dendix Brushes Limited, Chepstow, England, a British company
Filed July 29, 1965, Ser. No. 475,633
8 Claims. (Cl. 15—198)



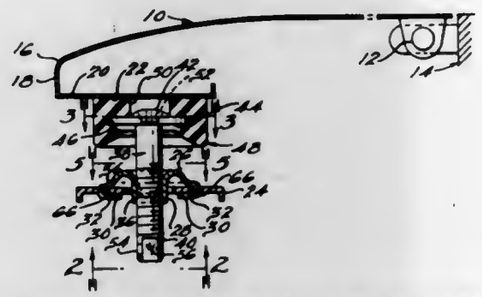
8. A component for a rotary brush, comprising a tuft-holding ring of zig-zag form, rigid tuft holders disposed at the peaks of the zig-zag and thereby arranged in two annular rows, the tuft holders all being substantially equidistant from the axis of the tuft-holding ring, tufts of brush filaments held by the tuft holders and extending outwardly of the tuft-holding ring, in each tuft holder a tubular support of resilient material which encloses the root of the tuft and is gripped by the tuft holder adjacent to and outwardly of the root of the tuft, and pivotal connections between the tuft holders and the tuft roots, the pivots being substantially parallel to the axis of the tuft-holding ring whereby when a tuft is bent in use in a plane perpendicular to said axis the tuft root is able to rock for short distances around its pivot and against the resistance provided by its tubular support.

3,274,635
SPONGE MOPS
Howard A. Myers, 63 Neponset Ave., Foxboro, Mass.
Filed Aug. 20, 1965, Ser. No. 486,256
11 Claims. (Cl. 15—244)

7. A sponge body for a mop having two principal, substantially flat and parallel work-engaging faces, a chamber centrally of said body and extending therethrough parallel to said faces and at right angles to the principal direction of movement of the mop body in normal use, and a slot opening through the rear edge of the body at right angles to and extending through said faces and intersecting said chamber, and sleeve-like, body reinforcing means within said chamber reinforcing substantial lengths of the chamber on both sides of the slot and having a yieldable inner friction surface.

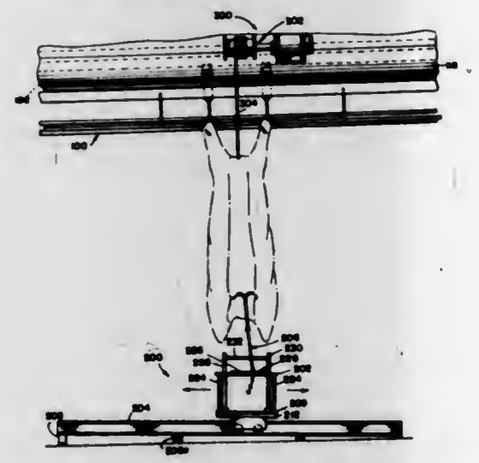
3,274,636
TAPE CLEANER
Raymond E. MacGregor, Doylestown, Pa., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed June 29, 1964, Ser. No. 378,791
5 Claims. (Cl. 15—306)

1. A tape cleaner comprising: a scraper unit having a relatively hard smooth cylindrical surface for engagement with said tape, said scraper unit having a pair of arcuate slots, each of said slots including a single cutting edge disposed to contact said tape during operation, a block element having a chamber disposed below said scraper unit for receiving particles removed from said tape by said cutting edge, said chamber being shaped to provide a vortex movement of air when air is caused to be moved within said chamber, said block including a plurality of apertures arranged to permit air from the atmosphere to enter said chamber in the same tangential flow direction, and vacuum means connected to said chamber to cause a vortex movement of said air within said chamber to force particles removed from said tape to be moved away from said tape and out of said chamber.



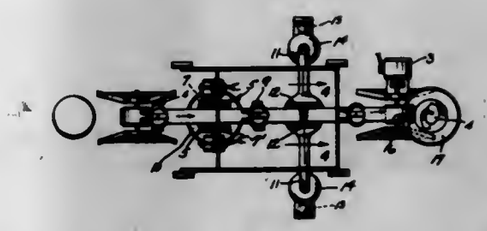
3,274,637
PAINT APPLICATOR AND ROLLER THEREFOR
Ernest G. Schulze, 78 Black Oak Ridge Road, Wayne, N.J.
Filed Mar. 11, 1966, Ser. No. 536,563
18 Claims. (Cl. 15—522)

1. A roller paint applicator comprising a housing, said housing including a trough portion and end members closing the ends of said trough portion; a roller member formed of porous spongy resiliently deformable material freely rotatably journaled in said end members; a flap member carried by said housing and pivoted for rotation about a pivotal axis parallel to the rotational axis of said roller member, said flap member having a free rectilinear edge portion extending parallel to said rotational axis, said flap member comprising a pressure-applying portion spaced from said free edge portion toward said pivotal axis, said pressure-applying portion being engageable with a lateral portion of said roller to compress said roller into a deformed cylindrical configuration, said free edge portion being engageable with a flat surface to maintain said roller in said deformed condition for applying a free



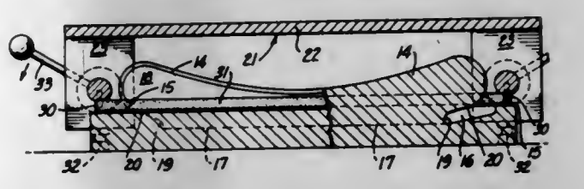
portion of said deformed roller against another surface forming a corner with said flat surface; and stop means limiting pivotal movement of said flap member away from said roller member.

3,274,638
FASTENER ARRANGEMENT
Alfred A. Bien, Dearborn, Mich., assignor to Chrysler Corporation, Highland Park, Ill., a corporation of Delaware
Filed Aug. 8, 1963, Ser. No. 300,793
6 Claims. (Cl. 16—86)



1. In combination with a pivotally mounted panel member, adjustable means for abuttingly engaging a swingable end of said panel, said means comprising a support, a self-piercing nut secured to said support, said nut comprising a flange, a generally tubular threaded portion, a body portion interconnecting said flange and threaded portion, a plurality of piercing tabs formed on said flange extending through said support and formed thereagainst in order to retain said support generally between said flange and said tabs, a screw having a threaded shank portion threadably received by said tubular threaded portion and a head portion, a radially extending flange portion formed on said screw near said head, a resilient member received generally about said screw flange portion, an opening formed in said resilient member providing a means of access to said screw head for adjustment of said screw, and a tool-engaging surface formed on said shank portion for axially adjusting said screw and said resilient member so as to cause said resilient member to abut against said swingable end of said panel at a desired portion of said panel.

3,274,639
HIDE-PULLING APPARATUS
Robert L. Knauss, Omaha, Nebr., assignor to Armour and Company, Chicago, Ill., a corporation of Delaware
Filed June 3, 1964, Ser. No. 372,286
8 Claims. (Cl. 17—21)

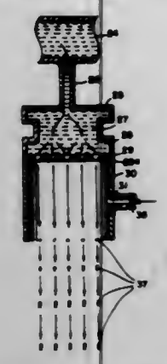


1. In an apparatus for removing the hides from animal carcasses, means for supporting a carcass to hang downwardly from the two hind legs and for moving the carcass in one direction horizontally, means for pulling the hide of the carcass substantially vertically upwardly from the head end and completely off the carcass during the movement of the carcass horizontally, and means secured for movement with the carcass to hold the carcass downwardly in opposition to the forces exerted by the pulling means.

3,274,640
METHOD OF REMOVING MEAT FROM CRABS
Michael Rossnan, 11724 Lovejoy St., Silver Spring, Md.
Original application Sept. 23, 1965, Ser. No. 489,622, now Patent No. 3,249,962, dated May 10, 1966. Divided and this application Jan. 13, 1966, Ser. No. 520,419
4 Claims. (Cl. 17—45)

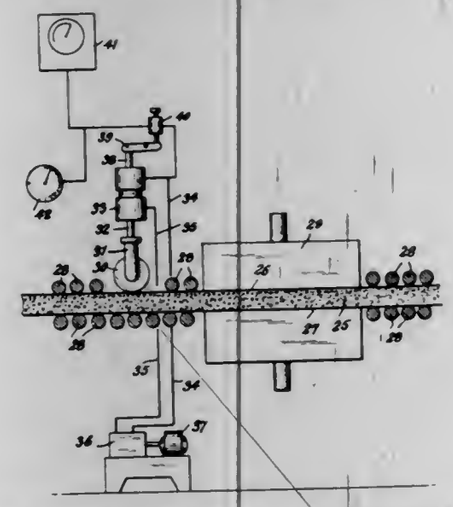
1. The method of removing meat from a crab body, comprising removing the claws, crawling fingers, paddles and ends of the main shell to leave open ended stubs leading to the cavities of the crab body, and sucking the meat from all the cavities simultaneously.

3,274,641
APPARATUS AND METHOD FOR MAKING CRUTCH PADS
Howard C. Lien, Los Angeles, Calif., assignor to Alfred A. Smith, North Hollywood, Calif.
Filed Feb. 28, 1963, Ser. No. 261,798
10 Claims. (Cl. 18—1)



5. In an apparatus for making molded crutch pads of the type having a crutch receiving opening with an elastic reinforcing band disposed adjacent to said opening, said pad being formed on a mandrel, a loading device having holding means slightly larger than said mandrel, said band adapted to be mounted on said holding means, said loading device adapted to be disposed adjacent to said mandrel so that said band substantially surrounds said mandrel, and means for releasing said band from said holding means into engagement with said mandrel.

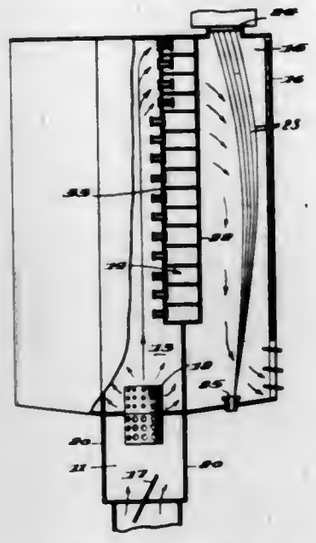
3,274,642
APPARATUS FOR PRILLING AMMONIUM NITRATE
John W. Cramer, Crystal City, Mo., assignor to Armour and Company, Chicago, Ill., a corporation of Delaware
Filed May 12, 1965, Ser. No. 455,272
10 Claims. (Cl. 18—2.7)



1. An apparatus for prilling liquid ammonium nitrate, including a prilling tower equipped at its top with a plurality of stationary quiescent liquid reservoirs, an orifice plate forming the bottom of each of said reservoirs and through which may freely fall streams of liquid ammonium nitrate, a sound producing system, a sound chamber communicating with and depending from the lower portion of said plate, means for communicating said sound

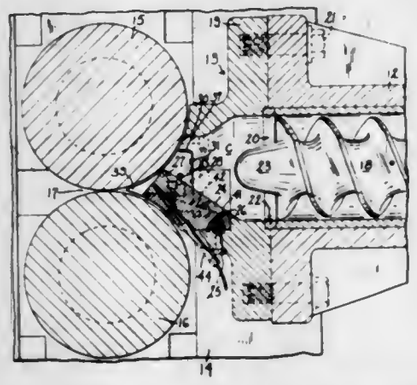
producing system and said sound chamber, means for impinging sonic vibrations upon said streams, and means for

passing upwardly in countercurrent to said streams blasts of cooling gas.



3,274,643
APPARATUS FOR DETERMINING THE EXPANSIVE PRESSURE OF MOLDED POLYSTYRENE BEADS
Berton R. Oxel, New Castle, Pa., assignor to Dyfoam Corporation, New Castle, Pa., a corporation of Pennsylvania
Filed July 20, 1964, Ser. No. 383,822
3 Claims. (Cl. 18—4)

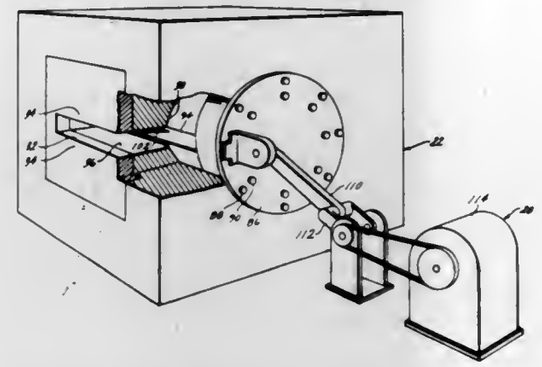
1. In an apparatus for the molding of plastic from the expansion of polystyrene beads, the combination comprising a pair of moving endless bands between which said beads are expanded and molded, said bands being supported and motivated by a plurality of spaced rollers; a steam chest positioned along the path of said bands and through which said bands and said beads travel to cause the expansion of said beads; the improvement comprising the replacing of one of said spaced supporting and motivating rollers immediately adjacent the discharge end of said steam cabinet by a motion indicating means, said means being in direct contact with said band so as to be responsive to, and to be able to transmit, any relative movement of said bands caused by the expansion of said beads.



3,274,644
ADJUSTABLE PROFILE CHIMNEY
William Moore Massey, Signal Mountain, and Bill L. Pope, Hixson, Tenn., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Apr. 27, 1964, Ser. No. 362,908
4 Claims. (Cl. 18—8)

1. In combination with apparatus for cooling textile filaments formed by extruding molten film-forming material through a spinneret, a quenching chamber comprising essentially vertical inlet and outlet panels for allowing a gaseous cooling medium to pass through said chamber, and means for passing the extruded filaments vertically downwards through said chamber, each of said inlet and outlet panels comprising a plurality of adjacent, horizontally disposed sections and each of said sections contain-

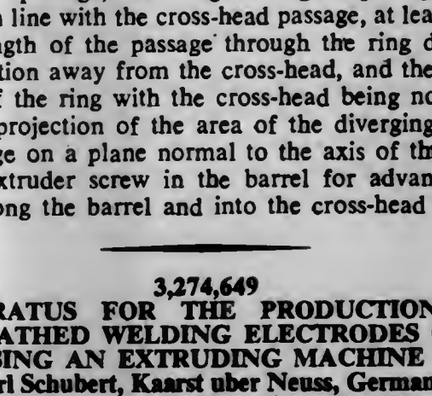
ing means for individually regulating the stream of said gaseous cooling medium passing through said section, whereby both the total strength of the gaseous stream going through the quenching chamber and its general direction as it contacts the descending plurality of filaments may be regulated.



3,274,645
EXTRUDER-ROLLER DIE
Donald C. Chase, Milford, Conn., assignor to Farrel Corporation, Ansonia, Conn.
Filed Nov. 20, 1963, Ser. No. 324,973
8 Claims. (Cl. 18—12)

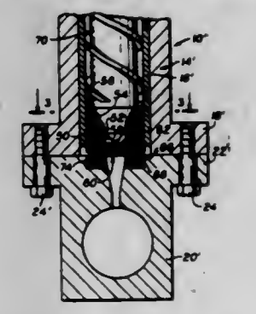
1. An extruder-roller die comprising an extruder head defining an extruder die cavity therethrough between a discharge orifice and an inlet orifice adapted to receive material forced therein in a plastic state, a pair of cooperating rolls defining a nip therebetween, said extruder head and said discharge orifice being arranged to introduce the material onto said rolls adjacent the nip thereof for forming said material by said nip, said discharge orifice being of substantially greater horizontal and lesser vertical dimension than said inlet orifice, the vertical dimension of the discharge orifice at the center thereof being lesser than the vertical dimension of the discharge orifice at the ends thereof so that material introduced into the cavity through said inlet orifice is uniformly spread along the width of the cavity and material is discharged from said discharge orifice on to said rolls with

substantially uniform characteristics, and said rolls act to pull material through said cavity and discharge orifice to said nip.



3,274,646
APPARATUS FOR MAKING EXTRUDED SHEET MATERIAL
Joseph P. Krystof, Kensington, Conn., assignor to Rowland Products, Incorporated, Kensington, Conn., a corporation of Connecticut
Filed May 13, 1963, Ser. No. 279,919
13 Claims. (Cl. 18—13)

1. An extrusion assembly for fabricating synthetic thermoplastic sheet material having a differentially colored band therein comprising an extruder die member having a chamber therein and an extrusion orifice in one surface thereof communicating with said chamber; a first conduit for supplying a mainstream of fluid synthetic thermoplastic material to said chamber at a point spaced from said extrusion orifice; a second conduit for supplying a stream of differentially colored fluid synthetic thermoplastic material to said chamber, said second conduit having a portion extending within said chamber generally parallel to said extrusion orifice and of smaller external dimension than said chamber to allow flow about at least one surface of a main stream of fluid synthetic thermoplastic material issuing from said first conduit, said second conduit portion having a discharge portion within said chamber reciprocable substantially rectilinearly and substantially parallel to said die orifice between said point of supply from said first conduit and said die orifice, said reciprocable discharge portion having a discharge aperture thereing opening adjacent said die member orifice; and means for reciprocating said discharge portion and its discharge aperture substantially parallel to said die orifice and transversely of a plastic mainstream issuing from the first conduit to discharge thereinto a differentially colored band moving longitudinally of said second conduit and to produce a sheet of thermoplastic material extruding from said die orifice comprised of the thermoplastic material of the mainstream with a generally longitudinally extending color band embedded therein and having a transverse directional component.

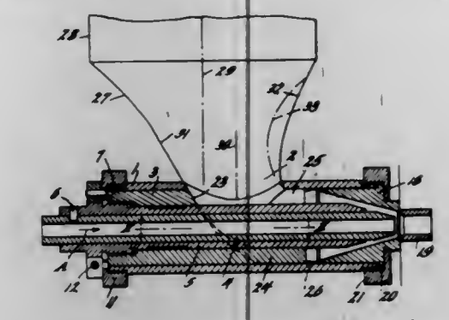


3,274,647
EXTRUSION MACHINES FOR PLASTIC MATERIAL
Léon Andouart, Paris, France, assignor to Societe des Etablissements Andouart, Bezons, Seine-et-Oise, France, a corporation of France
Filed June 19, 1964, Ser. No. 376,388
Claims priority, application France, July 29, 1963, 942,994
3 Claims. (Cl. 18—12)

1. In an extrusion machine for the manufacture of objects of plastic material from powder, comprising a vertical screw that feeds downwardly to a horizontal screw, the improvement comprising heating means for said vertical screw so that a monomeric plastic powder may be transformed to a jelly during passage along said vertical screw, drive means for said vertical screw connected to the lower extremity of said vertical screw, and a supply hopper

coaxial with the upper end of said vertical screw, the axes of said screws being spaced apart and a portion of said vertical screw extending down beside said horizontal screw.

3,274,648
SEAL RING FOR SCREW TYPE EXTRUDERS
William B. Van Orman, Clearwater Beach, Fla., assignor to General Cable Corporation, New York, N.Y., a corporation of New Jersey
Filed June 29, 1965, Ser. No. 468,046
15 Claims. (Cl. 18—13)

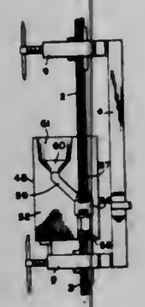


1. In plastic extrusion apparatus, the combination including an extruder barrel having a cylindrical chamber therein, a cross-head connected with the extruder barrel and extending across the end of the chamber, the cross-head having a passage therein into which plastic material is discharged from the barrel, a seal ring that fits into the end portions of the barrel and that is axially movable in the barrel into contact with the cross-head, around the cross-head passage, the ring having a passage therethrough in line with the cross-head passage, at least a part of the length of the passage through the ring diverging in a direction away from the cross-head, and the area of contact of the ring with the cross-head being no greater than the projection of the area of the diverging part of the passage on a plane normal to the axis of the barrel, and an extruder screw in the barrel for advancing the plastic along the barrel and into the cross-head passage.

3,274,649
APPARATUS FOR THE PRODUCTION OF SHEATHED WELDING ELECTRODES COMPRISING AN EXTRUDING MACHINE
Karl Schubert, Kaarst uber Neuss, Germany
Filed Oct. 24, 1965, Ser. No. 504,458
Claims priority, application Germany, Mar. 14, 1962, R 32,284
5 Claims. (Cl. 18—13)

1. Apparatus for the production of sheathed welding electrodes comprising a nozzle holder in the form of a bored body member having a lateral feed orifice therein

for the feeding an electrode sheathing material to the bore of said body member, an extrusion cylinder in front of said lateral feed orifice and arranged substantially transversely of said bored body, a forming nozzle positioned at an open end of said bored body, an electrode wire guiding tube positioned in said bored body and comprising a supporting tube which fits the outer wall of said



bored body, the space between said lateral feed orifice and said forming nozzle comprising a feed chamber for said sheathing material and having a cross-section which decreases substantially constantly along the path of said sheathing material between said lateral feed orifice and said forming nozzle with no substantial increase in cross-section along the path between said lateral feed orifice and said forming nozzle.

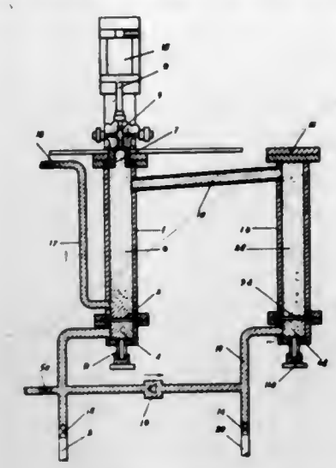
3,274,650

METHOD AND APPARATUS FOR JOINING METAL PARTS

Leonard Gelfand, South Euclid, Ohio, assignor to Erico Products, Inc., Cleveland, Ohio, a corporation of Ohio

Filed Apr. 8, 1964, Ser. No. 358,214
7 Claims. (Cl. 22—58)

1. Apparatus for splicing the opposed ends of deformed metal reinforcing bars and the like comprising a refractory mold having a weld chamber therein adapted to receive molten weld metal and the like, passages in said mold entering said chamber adapted to receive such bars with the ends thereof projecting into such chamber, a refractory batting surrounding at least one of such bars, and a thin deformable yet irresilient metallic wrapped on sleeve surrounding said batting and closely conforming to and within the respective passage.



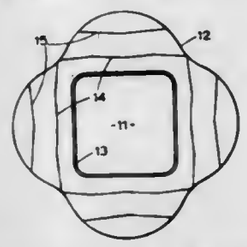
3,274,651

METHOD FOR INJECTING SAND IN MOULDING MACHINES

Fabio de Azevedo Oliveira, Rua Atlantica 114, Sao Paulo, Brazil

Filed Mar. 29, 1965, Ser. No. 443,346
4 Claims. (Cl. 22—193)

1. The method of injecting a mixture of resin and sand into a mould cavity comprising taking two columns of said mixture and applying low pressure air through a filter against the bottom of said columns to force the mixture into said cavity, thereafter increasing said air pressure a substantial amount to compact the mixture in said cavity, thereafter releasing the air pressure applied against one column while maintaining said pressure against the bot-



tom of the other column, thereafter permitting the pressure against said other column to progressively reduce to atmospheric pressure.

3,274,652

METHOD OF CONSTRUCTING A CASTING MOULD BY DETERMINATION OF ISOTHERMAL PATTERN

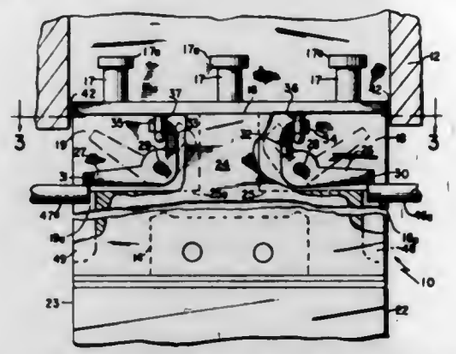
Allan Pearson Banks, Workington, Cumberland, England, assignor to Distington Engineering Company Limited

Filed Aug. 24, 1964, Ser. No. 391,808
Claims priority, application Great Britain, Aug. 23, 1963, 33,444/63
4 Claims. (Cl. 22—193)

1. A method of constructing a casting mold for casting metal, the mold having a cavity of given cross-sectional shape and dimensions, said method comprising the steps of:

(a) determining the cross-sectional isothermal pattern which exists in the wall of a trial mold having a wall of uniform thickness and a cavity of given shape and dimensions during cooling of metal cast in such mold; and

(b) constructing a final mold having a cavity of said given cross-sectional shape and dimensions and having a wall the outer cross-sectional periphery of which conforms substantially to a selected one of the isotherms of said isothermal pattern.



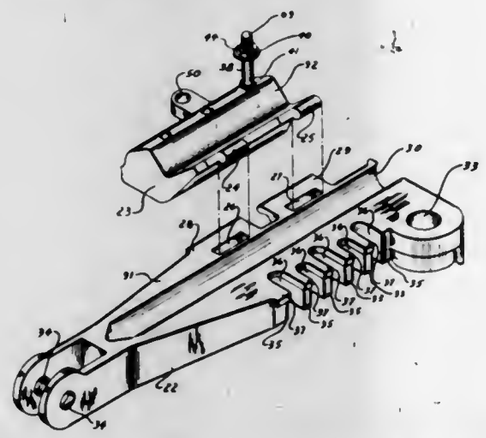
3,274,653

QUICKLY DISCONNECTABLE STARTER BAR

Justin E. Foldessy, Ogden Dunes, and Andrew L. Poulos, Ross Township, Lake County, Ind., assignors to United States Steel Corporation, a corporation of Delaware

Filed Dec. 26, 1963, Ser. No. 333,449
2 Claims. (Cl. 22—57.2)

1. In a continuous metal casting apparatus comprising a mold of rectangular cross-section in which metal is cast, a plurality of guide rolls below the mold for guiding a metal casting as it descends, and pinch rolls below said guide rolls for controlling the rate of descent of the casting, the improvement comprising a chill plate of rectangular cross-section slightly smaller than that of said mold for closing the bottom of the mold when the metal is first cast, a rigid starter bar for connection to said plate to support the plate until the cast metal solidifies thereon and becomes attached thereto and to then move the plate and casting downwardly and thus start the casting process, the top section of said starter bar being of the same cross-sectional size and shape as said chill plate and having a pair of recesses therein, a pair of latches respectively located in said pair of said recesses, each of said latches



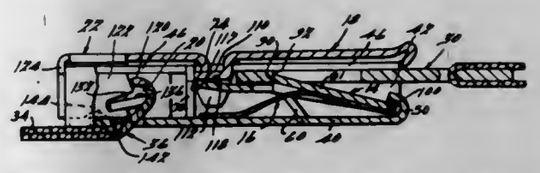
being pivotally mounted on said starter bar for rotation about a horizontal axis and including an outwardly extending arm and an upwardly extending arm terminating in a hook for securing said chill plate to said starter bar, and means located exteriorly of said starter bar for engaging said outwardly extending arms when said top section of said starter bar reaches a predetermined elevation between said mold and said pinch rolls in its descent and for holding said arms against downward travel with the bar long enough to disengage said starter bar from said chill plate and the attached casting.

3,274,654

HINGED DEAD END

Stephen P. Becker, Poughkeepsie, N.Y., assignor to Fargo Mfg. Company, Inc., Poughkeepsie, N.Y., a corporation of New York

Filed Aug. 4, 1964, Ser. No. 387,387
4 Claims. (Cl. 24—125)



1. A dead end connector for a transmission cable including an elongated body, a cable-receiving longitudinal channel formed in said body, a pressure pad, a flange projecting from said body, a slot provided in said flange, an underlying first contact surface at the free end of said flange, a hook member projecting from said pressure pad and through said slot, a second contact surface formed on said hook member engaging said first contact surface in the closed position of said pressure pad, one of said contact surfaces being arcuate and the other of said contact surfaces being pointed forming a hinged connection, and first and second cooperating coupling means attached to said pressure pad and said body respectively with said channel between said hinged connection and said second coupling means whereby said pressure pad overlies said channel when said first and second coupling means are in cooperative relationship.

3,274,655

SAFETY BELT BUCKLE

Robert C. Fisher, Bloomfield Hills, Mich., assignor to Hamill Manufacturing Co., Washington, Mich., a corporation of Michigan

Original application July 3, 1962, Ser. No. 207,262, now Patent No. 3,131,451, dated May 5, 1964. Divided and this application Mar. 12, 1964, Ser. No. 366,673
5 Claims. (Cl. 24—196)

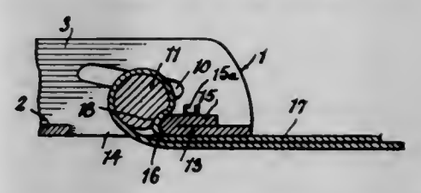
1. In a safety belt buckle comprising a base member, means for attaching one portion of the belt to said base member, an improved mechanism for adjustably securing a looped portion of the belt to the base member comprising

a slide supported by said base member for movement relative thereto and having

a pair of laterally spaced ears thereon with

a pair of truncated triangular apertures therein, respectively, and

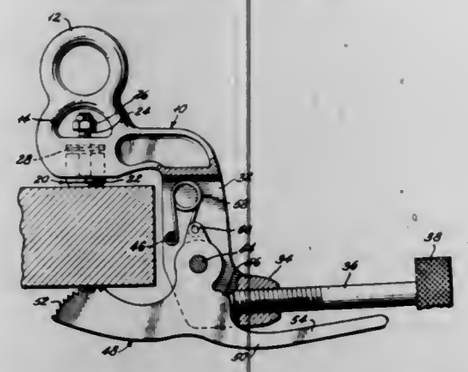
a belt bar having



flat opposite end portions supported within the apertures of said slide, respectively, tensioning of one side of the looped portion of said belt effecting rotation of said belt bar so that the end portions thereof engage one side of the apertures in said slide thereby to facilitate shortening of said belt, tensioning of the other side of the looped portion of the belt effecting rotation of said belt bar so that the end portions thereof engage the opposite sides of the apertures in said slide thereby to hold the belt against slippage.

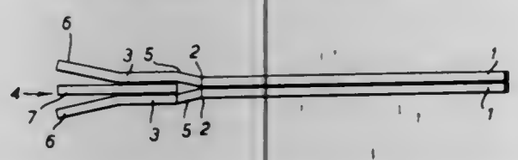
3,274,656

BELT MOUNTING IN SAFETY BELT BUCKLES



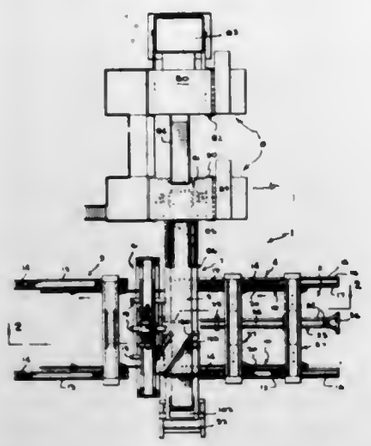
Walter F. Hamann, Huntington, N.Y., assignor to American Safety Equipment Corporation, New York, N.Y., a corporation of New York

Filed May 28, 1964, Ser. No. 370,930
2 Claims. (Cl. 24—196)



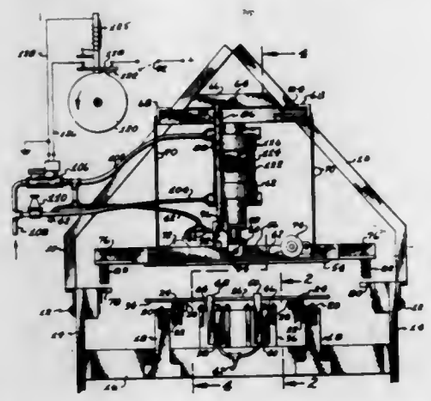
1. A buckle having a body provided with a bottom wall and side walls, the bottom wall having an opening constituting a belt passage, a portion of said bottom wall being turned over inwardly upon itself to locate such turned-over portion on the inside of the body and between the side walls thereof to thereby provide an abutment extending wholly between the side walls and constituting an edge of the opening, the side walls of the body having slots inclined in relation to said bottom wall, a rod slidable in said slots to and from the abutment, said rod having an arcuate edge facing the abutment and adapted for contact therewith, and means extending inwardly from the side walls and overlying the ends of the turned-over portion to thereby confine said portion between them and the inside face of the bottom wall of the body.

3,274,657
SAFETY CLAMP
Raymond L. Renfroe, Jacksonville, Fla., assignor to J. C. Renfroe & Sons, Inc., Jacksonville, Fla., a corporation of Florida
Filed Mar. 5, 1964, Ser. No. 349,722
10 Claims. (Cl. 24—248)



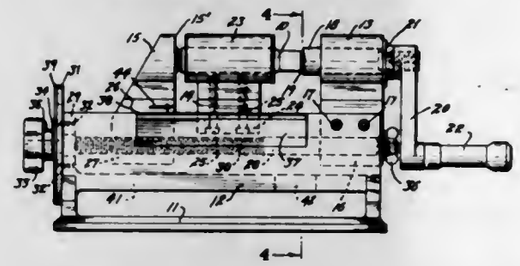
1. A safety clamp adapted to be operated with one hand and to be quickly and securely attached to and removed from a structural member comprising: a light portable clamp body; connection means on said body for attachment to a safety line; a first jaw mounted on said body; a second jaw movably mounted on said body for movement between open and closed positions in relation to said first jaw, said jaws having gripping surfaces defined by pointed protrusions adapted to bite into the structural member; spring means biasing said second jaw from said open position to said closed position; manually operable means connected to said second jaw for moving said second jaw to said open position; manually operable locking means mounted on said body in cooperative relation to said second jaw for positively urging said second jaw toward said first jaw; and grip means connected to said body closely adjacent and opposite said first named manually operable means to facilitate one hand operation of the safety clamp.

3,274,658
CLAMPING DEVICES
Charles Edward Pile, Greenford, Middlesex, England, assignor to Down Bros. and Mayer & Phelps Limited, Mitcham, England, a British company
Filed Nov. 30, 1964, Ser. No. 414,584
Claims priority, application Great Britain, Dec. 5, 1963, 48,090/63
10 Claims. (Cl. 24—259)



1. A clamping device comprising a pair of co-operating clamping members and at least three superposed coils forming a coil spring, one of the outermost of said coils being secured, in the region of the free end of said outermost coil, to one end of one of said clamping members, and the other of the outermost of said coils being secured, in the region of the free end of said other outermost coil, to one end of the other of said clamping members, at least a portion of at least one of said outermost coils being inclined outwardly from a plane parallel to the plane of the adjacent coil of said spring to form a lever that, when brought towards said adjacent coil, causes said clamping members to separate against a restoring force arising at least in part from torsion in the portion of the spring between the said outermost coils.

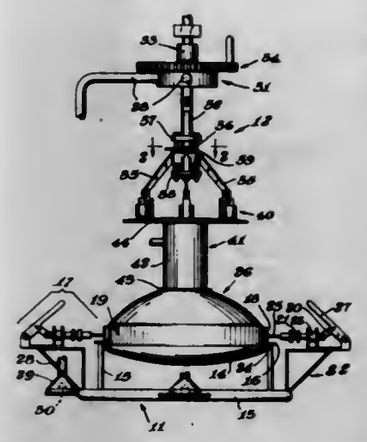
3,274,659
APPARATUS FOR FORMING CONCRETE ARTICLES
Robert S. Baker, P.O. Box 11615, Tampa, Fla.
Filed June 10, 1965, Ser. No. 462,904
7 Claims. (Cl. 25—2)



5. Apparatus for delivering mixed concrete into a mold box comprising, a support, a frame mounting the support to lie parallel to the mold box, the support being pivotally connected at one end to the frame, a load registering device on the frame upon which the other end of the support rests, an endless belt mounted on the support and having a concrete-receiving flight above the plane of the top of the mold box, a deflector movable over the concrete-receiving flight of the belt in sweeping relation thereto, and means to move the deflector along the said belt flight to sweep concrete therefrom into the mold box.

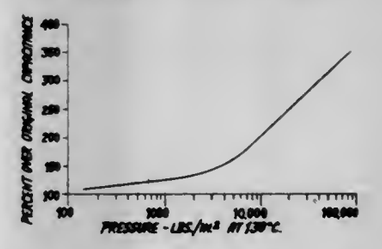
3,274,660
SLUMP BLOCK PRODUCING MACHINE
Bill L. Mizer, Phoenix, Robert T. Mizer, Scottsdale, and Donald E. Whitehurst, Phoenix, Ariz., assignors to Builders Equipment Company, a corporation of Arizona
Filed Oct. 17, 1960, Ser. No. 63,040
4 Claims. (Cl. 25—41)

1. In a slump block producing machine the combination of: a delivery conveyor of a conventional high production concrete block machine; a vertically movable pressure plate disposed above said conveyor and adapted vertically to move into engagement with the upper surfaces of concrete blocks disposed on a pallet carried by said conveyor; actuating means coupled to said pressure plate and supporting the same; a frame for supporting said actuating means whereby said pressure plate is suspended thereby; said actuating means pivoted to said last mentioned frame so that the plane of said pressure plate is readily conformable to the planes of concrete blocks supported on a pallet therebelow; first vibrating means disposed to vibrate a pallet on said conveyor below said pressure plate; and second vibrating means coupled with said pressure plate for vibrating it; first means operable by a high production concrete block machine in connection with said conveyor said first means coupled to said actuating means and said first and second vibrating means for automatically initiating operation of said pressure plate actuating means and said first and second vibrating means; limit switch means disposed to be actuated in accordance with downward movement of said pressure plate for deenergizing said actuating means and said first and second vibrator means when said pressure plate reaches a predetermined vertical position; stop means in connection with said pressure plate; members stationarily disposed to be engaged by said stop means for mechanically limiting the downward travel of said pressure plate, said conveyor comprising compressible belts supporting a pallet thereon and bars slightly below the upper surfaces of said belts disposed to support the lower surface of a pallet when said pressure plate engages and compresses blocks on the upper surface thereof.



3,274,661
DEVICES FOR MEASURING AND TRIMMING GUN CARTRIDGE CASINGS
John W. Westbrook, 4951 S. Rio Grand, Littleton, Colo.
Filed Dec. 31, 1964, Ser. No. 422,722
4 Claims. (Cl. 29—1.32)

1. A cartridge casing measuring and trimming device comprising:
(a) a pair of horizontal, parallel, spaced-apart ways;
(b) a head stock mounted on and arising from the rear extremities of said ways;
(c) a horizontal trimmer shaft journalled in said head stock, above, parallel to, and intermediate said ways;
(d) milling teeth formed on the forward extremity of said trimmer shaft;
(e) shell casing supporting means supported from said ways and adapted to support a casing forwardly of and in alignment with said trimmer shaft;
(f) stop means supported by said ways forwardly of said casing supporting means to be contacted by said shell casing for limiting the forward movement of the latter;
(g) means for rotating said trimmer shaft to cause said milling teeth to trim away one extremity of said shell casing;
(h) a threaded shaft journalled between and parallel to said ways, said stop means being threaded on said threaded shaft; and
(i) means for rotating said threaded shaft to cause said stop means to travel along said ways.

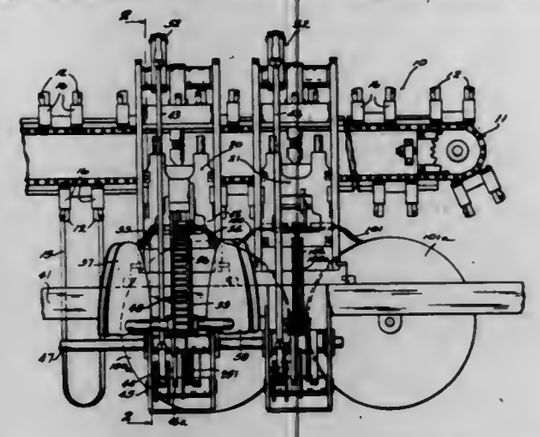


3,274,662
POSITIONING MACHINE
Robert M. Jackman and Jerry L. Allswede, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 23, 1961, Ser. No. 84,412
8 Claims. (Cl. 29—25.19)

1. A mechanism for aligning in spaced apart relationship two members having substantially mating surfaces which comprises a perimetric receiving, spacing and holding frame having matching member locating means, said frame being provided with self-centering means about its periphery; a matching member moving element, said moving element consisting of a frame network having self-centering mating engagement means to mate with said holding frame self-centering means and being provided

with an axially positioned adjustable moving means having in engageable intermittently lockable position an open ended vacuum cup closed on one end by a plate which extends peripherally beyond the cup diameter, said cup being engageable with one of said matching members and capable of holding said member for movement axially away from said other member.

3,274,663
ELECTRICAL CAPACITOR AND METHOD OF MAKING THE SAME
Leo J. Bonenfant and George T. Thurston, Hudson Falls, N.Y., assignors to General Electric Company, a corporation of New York
Filed Sept. 6, 1962, Ser. No. 221,779
6 Claims. (Cl. 29—25.42)

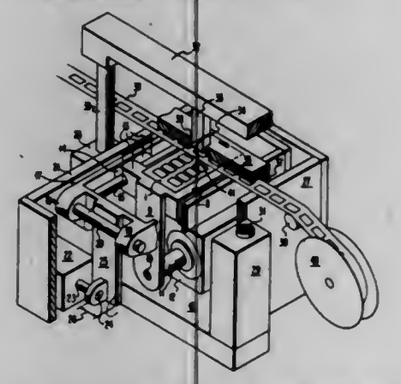


1. The method of making an electrical capacitor which comprises forming a wound roll of a superposed assembly of a pair of aluminum foil electrodes separated by polyethylene terephthalate dielectric sheets, and subjecting said wound roll to a pressure of about 10,000 to 75,000 pounds per square inch at a temperature of about 90° C. to 220° C. for reducing the thickness of said dielectric sheets and removing the air between said electrodes, whereby the capacitance of the capacitor is increased and the volume of the capacitor is reduced.

3,274,664
TERMINAL ATTACHING DEVICE
Karl H. Andren, West Allis, and Clarence R. Tuttle, Milwaukee, Wis., assignors to Artos Engineering Company, Milwaukee, Wis., a corporation of Wisconsin
Filed June 12, 1964, Ser. No. 374,592
8 Claims. (Cl. 29—33)

1. In a terminal attaching device, a supply of terminals for feeding along a center line of a terminal die, a supply of terminals for feeding along an axis in angular relation

to said terminal die center line, means for feeding said terminals along said center line, means for feeding said terminals at an angle thereto, means for presenting a cord having a plurality of conductors to said terminals, means



for simultaneously crimping a plurality of terminals on said plurality of conductors, and means actuated by said crimping means for advancing said terminals toward a terminal attaching zone.

3,274,665

MECHANICAL CHIP POSTING MECHANISM

Austin H. Higginson, Santa Clara, and Clyde C. Roshon, San Jose, Calif., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Oct. 6, 1964, Ser. No. 401,935
8 Claims. (Cl. 29—33)

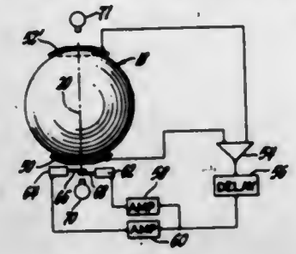
1. In a storage system wherein inserts cut from a length of film are removably mounted in apertures in carriers, the combination comprising:

a carrier having inner, front and back laminations,

at least one composite aperture in said carrier,

the apertures in the inner lamination being slightly larger than the apertures in the front and back laminations at two opposite extremities thereof whereby retaining slots are formed in the composite apertures, and

means for cutting said inserts from said length of film and frictionally mounting them in the retaining slots of said composite apertures.



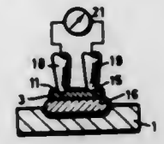
3,274,666

METHOD OF PRODUCING A SPHERICAL GYRO ROTOR

Arnold T. Nordsieck, Santa Barbara, Calif., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed May 26, 1965, Ser. No. 459,011
7 Claims. (Cl. 29—148.4)

1. A method of producing a body which assumes a spherical shape when rotated about a design axis at a relatively high design speed comprising the steps of forming a generally spherical body of substantially uniform plurality of randomly oriented axes at a relatively low density material, successively rotating the body about a speed, sensing, during the low speed rotation, surface nonuniformities and prefecting the static sphericity of the



body by eliminating the surface nonuniformities sensed, rotating the body about the design axis at the design speed, sensing the centrifugal distortion in the body and altering the quantity of material in the surface of the body thereby to perfect the dynamic sphericity of the body at the design speed.

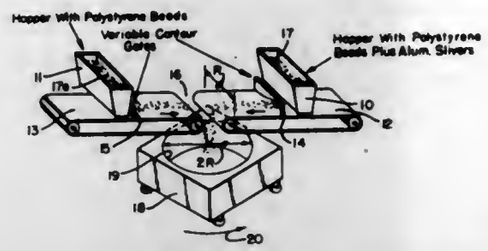
3,274,667

METHOD OF PERMANENTLY CONTACTING AN ELECTRONIC SEMICONDUCTOR

Karl Siebertz, Munich-Obermenzing, Germany, assignor to Siemens & Halske Aktiengesellschaft, Berlin, Germany, a corporation of Germany

Filed Sept. 17, 1962, Ser. No. 223,976
Claims priority, application Germany, Sept. 19, 1961, S 75,819
1 Claim. (Cl. 29—155.5)

The method of contacting an electrode of an electronic semiconductor assembly which comprises placing a strip member of contact material having a width substantially equal to a face dimension of the electrode in substantially full face-to-face relation against the electrode of the semiconductor assembly to be contacted, pressing at least two mutually insulated punches of thermoelectrically different respective materials against the strip member in the direction toward the electrode of the semiconductor assembly, simultaneously passing electric current through said punches and thus through the strip-member portion intermediate the pressure locations to thereby electrically heat said locations to an elevated temperature for permanently attaching said member, and measuring the thermoelectric voltage generated between said two punches as a measure of said temperature.



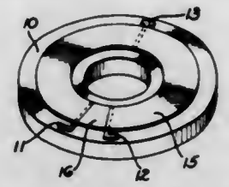
3,274,668

METHOD OF MAKING THREE-DIMENSIONAL DIELECTRIC LENS

Robert L. Horst, Lancaster, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

Filed Aug. 2, 1965, Ser. No. 477,669
22 Claims. (Cl. 29—155.5)

16. The method of fabricating a three-dimensional dielectric lens having a varying dielectric constant which comprises the steps of fabricating a substantially cylindrical starting mass of dielectric material exhibiting a two-dimensional variation in dielectric gradient in directions between the central axis and outer circular side of said cylindrical starting mass, slicing said starting mass along oppositely inclined planes extending transverse to the outer circular side of said mass with said oppositely inclined planes intersecting one another substantially along a diametrical plane in said mass thereby to form plural wedges of two-dimensionally graded material, each of which wedges has a relatively thin substantially linear edge taken from a central portion of the starting mass with the opposing ends of said linear edge being intercon-



nected by a substantially semi-circular varyingly thickened edge taken from the outer circular side of a said mass, and assembling a plurality of said wedges into a three-dimensional mass with the linear edges of said wedges being disposed in substantially colinear relation to one another and with the thickened edges of said wedges being disposed closely adjacent one another.

3,274,669

METHOD OF MAKING ELECTRICAL RESISTANCE ELEMENT

Thomas M. Place, Sr., Newport Beach, Calif., assignor to Beckman Instruments, Inc., a corporation of California

Original application Dec. 11, 1961, Ser. No. 158,317. Divided and this application Dec. 31, 1964, Ser. No. 435,767
4 Claims. (Cl. 29—155.7)

1. A method of making a resistance element, including the steps of:

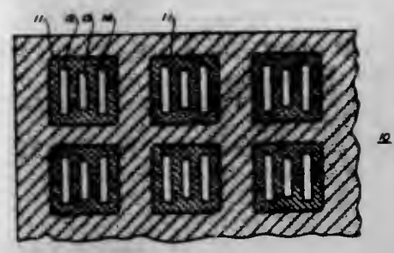
applying a metallic paste to a nonconductive support structure in a thin layer to define a terminal;

heating the unit to a first temperature to convert the paste to a metal layer adhered to the support structure;

applying a cermet resistance material mixture to the support structure in a first film, with the film covering a portion of the metal layer and having a gap therein;

applying a cermet resistance material mixture with a refractory oxide additive therein to render said mixture nonconductive to the support structure in a second film and bridging the gap in the first film;

and heating the unit to a second temperature lower than the first temperature and lower than the melting point of the metallic constituents of the mixtures and exceeding the melting point of the glass constituents of the mixture to produce a continuous glassy and substantially flat surface.



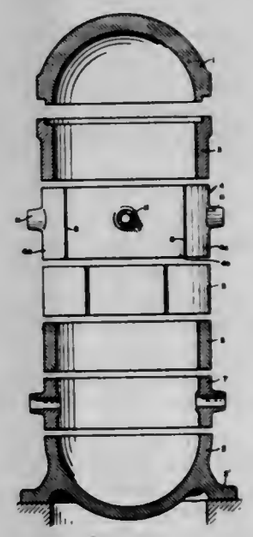
3,274,670

SEMICONDUCTOR CONTACT

Martin P. Lepselter, New Providence, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Mar. 18, 1965, Ser. No. 440,782
3 Claims. (Cl. 29—155.5)

1. The method of making low resistance contact to a body of semiconductor material of silicon comprising forming an oxide mask on a portion of the surface of said semiconductor body, depositing on said surface a layer of platinum, heating said body at a temperature and for a time sufficient to produce a solid phase reaction between the platinum and said semiconductor to form a compound of platinum and said semiconductor which has a lower light reflectivity than platinum of such degree as



to enable visual determination of the formation of said compound on the unmasked portions of said surface and which is insoluble in aqua regia, treating said surface with an aqua regia solution to remove the remaining platinum areas leaving the compound portions in place, and applying additional metal layers to said compound portions to complete the contacts.

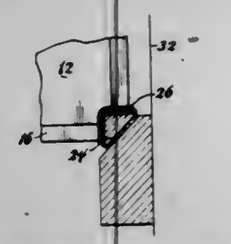
3,274,671

METHOD OF PRODUCING A PROJECTION ON A MACHINE COMPONENT

Josef Hauer, Radcice u Plzne, and Zdeněk Kobera, Plzen, Czechoslovakia, assignors to Zavody V.I. Lenina Plzen, narodni podnik, Plzen, Czechoslovakia

Filed Aug. 4, 1965, Ser. No. 479,048
Claims priority, application Czechoslovakia, Aug. 29, 1962, 4,980/62
6 Claims. (Cl. 29—157)

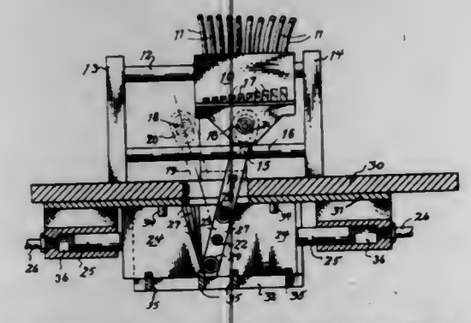
1. A method of producing a unitary machine element having a wall portion of substantially uniform thickness and a projecting portion integral with said wall portion, the dimension of said projecting portion in the direction of said thickness being substantially greater than said thickness, which method comprises:



(a) forming a unitary piece of material to an initial thickness substantially equal to said dimension, said piece having a minor central portion and a major peripheral portion extending from said central portion transversely of the thickness of said piece in all directions;

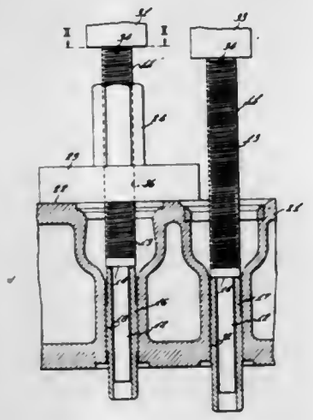
(b) selectively applying pressure to said peripheral portion in the direction of said thickness of said piece until the thickness of said peripheral portion is reduced to said substantially uniform thickness while retaining said central portion at said initial thickness.

(1) said peripheral portion of reduced thickness constituting said wall portion, and said central portion of initial thickness constituting said projecting portion, and



(c) piercing said central portion to form a passage therethrough in the direction of said dimension.

3,274,672
METHOD OF MAKING A HEAT EXCHANGER
Franklyn Doré, Wellsville, N.Y., assignor, by mesne assignments, to The Air Preheater Company, Inc., a corporation of Delaware
Filed June 4, 1963, Ser. No. 285,357
2 Claims. (Cl. 29—157.3)



1. The method of forming a plate type heat exchanger which comprises the steps of forming a multiplicity of plain sided rectangular element sheets to include flanged edges between recessed corners, welding pairs of sheets together along one pair of parallel flanged edges to provide a series of open-ended envelopes, assembling the envelopes together with their plane sides in mutually adjacent relationship and their open ends similarly disposed at opposite sides of the assembly, welding the open ends of the envelope assemblies at their flanged edges to other flanged edges adjacent thereto to connect the envelopes into an integral assembly, forming sealing bars with a surface conforming to the recessed corners of the assembled envelopes, fitting the sealing bars to the recessed corners, inserting the envelope assembly including sealing bars into a casing, and drawing the casing tightly around said assembly to force a sealing relationship between the sealing bars and the confronting edges of the recessed corners.

3,274,673
MAGAZINE AND TUMBLER PIN SELECTING DEVICE
Max G. Roland, San Carlos, Calif., assignor to Maromatic Company, Inc., Burlingame, Calif., a corporation of California
Filed June 21, 1965, Ser. No. 465,274
6 Claims. (Cl. 29—211)

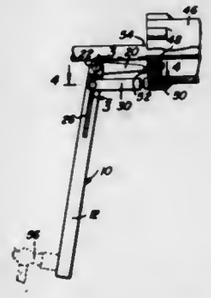
1. In a apparatus for selecting and assembling the key engaging pins of a tumbler lock to conform with the bits of a key, the combination of a movable pin supply magazine having segregated groups of tumbler pins of different lengths, stationary means for ejecting pins from said supply magazine as said magazine assumes different positions relative thereto, a preloading means movable with respect to said stationary pin ejecting means for transferring pins ejected from said supply magazine to a cylinder lock plug, and means for supporting a pinless key plug in a position to receive the pins ejected from said pin supply magazine as said preloading means is positioned thereover.

3,274,674
VALVE GUIDE REMOVING AND INSTALLING TOOL
Donald M. Hooper, Markham, Ill., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Filed Nov. 2, 1964, Ser. No. 408,015
4 Claims. (Cl. 29—214)

1. A valve guide removing and installing tool comprising:

an elongated cylindrical driver having

a pilot portion at one end thereof adapted for insertion into a tubular valve guide,



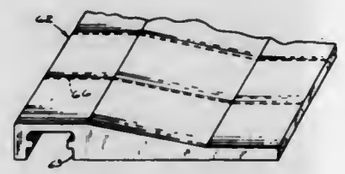
a shoulder of greater radial width than said pilot portion and spaced axially from said one end of said driver, said shoulder adapted to engage an axial end of said tubular valve guide, and

a threaded portion on said driver intermediate said shoulder and the other end of said driver,

a stop member having an opening through which said threaded portion extends, and

a nut threaded on said threaded portion of said driver on the side of said stop member remote from said shoulder, said nut being in abuttable relation to said stop member.

3,274,675
STRAIGHT AND CURVED BEARING PULLER
Beal S. Jackson, Rte. 10, Tulia, Tex.
Filed Sept. 4, 1964, Ser. No. 394,416
5 Claims. (Cl. 29—267)



1. A bearing puller comprising an elongated lever, a pull arm pivotally secured at one end to a first end of said lever for rotation about an axis extending transversely of said lever and arm, the other end of said arm including means adapted to engage a bearing race through which said other end of said arm is received, an elongated fulcrum member carried on a mid-portion of said elongated lever and projecting laterally outwardly therefrom and disposed in the plane of swinging movement of said pull arm, said lever and fulcrum member including coacting means defining a pivot connection between said lever and said fulcrum member for swinging movement of the free end of said fulcrum member relative to said lever through a plane substantially coinciding with the first-mentioned plane, said coacting means also including means operative to shift said pivot connection longitudinally of said lever.

3,274,676
METHODS OF MAKING SHADES
John E. Gallagher, Flossmoor, Orin N. Crider, Chicago Heights, and Bryson McCulloch, Flossmoor, Ill., assignors, by mesne assignments, to Slick Industrial Company, Chicago Heights, Ill., a corporation of Delaware
Continuation of application Ser. No. 197,185, May 21, 1962. This application Oct. 31, 1963, Ser. No. 320,274
9 Claims. (Cl. 29—400)

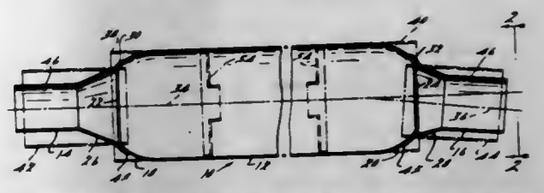
1. A method of making a shade comprising the steps of: expanding a foam plastic composition, curable to form a rigid foam, within a rigid tube; curing said foam to form said core; assembling end members including spring re-winding means on the ends of said tube; and attaching a shade to said tube by an end of said shade.

3,274,677
METHOD OF MAKING LEVER ARMS
Eugene L. Kilbourn, Marengo Township, Calhoun County, Mich., assignor to S. H. Leggitt Company, Marshall, Mich., a corporation of Michigan
Filed Apr. 24, 1963, Ser. No. 275,307
9 Claims. (Cl. 29—417)

1. A method of constructing a lever arm for a fluid pressure regulator comprising:

forming an elongated rigid member having a constant cross-sectional configuration and having an elongated, open groove longitudinally aligned with the longitudinal axis of said member;

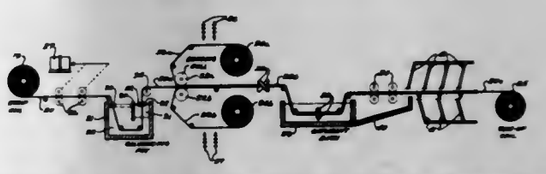
orienting said elongated member so that said groove opens upwardly;



providing retention means at the ends of said groove for constituting with said groove a container capable of holding a liquid;

pouring a resilient material in liquid form into said groove and allowing same to harden to a resilient state;

removing said retention means from said elongated member; and



severing successive, generally identical, segments from said member using cutting planes transverse to the longitudinal axis of said member, whereby each of said segments constitutes one of said lever arms.

3,274,678
METHOD OF MAKING A MUFFLER
Peter G. Andrews, Kitchener, Ontario, Canada, assignor to Walker Manufacturing Company, a corporation of Delaware
Original application May 11, 1962, Ser. No. 193,927, now Patent No. 3,159,239. Divided and this application May 25, 1964, Ser. No. 370,021
1 Claim. (Cl. 29—471.1)

The method of making a muffler for automotive exhaust systems, said muffler having an outer shell and conduit connecting fittings at opposite ends which comprises inserting silencing means inside said shell, indenting the opposite ends of a tubular outer shell to form spherical surfaces, enlarging the ends of tubular end fittings to form spherical surfaces thereon, positioning the spherical surfaces of the fittings on the spherical surfaces at the ends of the shell and adjusting said fittings so that the axes thereof make the desired angles with the axis of the shell, and welding the spherical surfaces of the fittings to the spherical surfaces of the shell.

3,274,679
PROCESS FOR FABRICATING PROTECTED METAL SHEETS
Harold E. Kennedy, Pittsburgh, Pa., assignor to H. H. Robertson Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 19, 1963, Ser. No. 331,719
4 Claims. (Cl. 29—473.1)

1. In the process of producing a protected metal sheet from a coil of metal core sheet including the sequential steps of:

metal-coating the metal core sheet;

applying a substantially asbestos felt sheet to said metal coating while said coating is at least partially molten, thereby bonding said substantially asbestos felt sheet to said metal sheet;

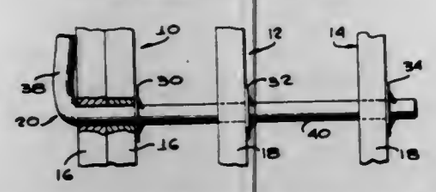
impregnating the said asbestos felt sheet with a high flash point asphalt saturant in molten condition; and

recoiling the resulting protected metal sheet;

the improvement comprising: recoiling the said resulting protected metal sheet at a temperature between 250° and 400° F.

3. In the process of producing a protected metal sheet from a coil of metal core sheet including the sequential steps of:

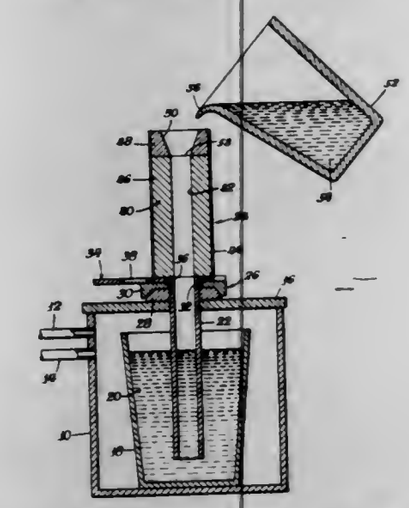
metal-coating the metal core sheet;



applying a substantially asbestos felt sheet to said metal coating while said coating is at least partially molten, thereby bonding said substantially asbestos felt sheet to said metal sheet;

impregnating the said asbestos felt sheet with a high flash point asphalt in molten condition; and

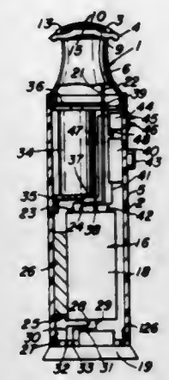
recoiling the resulting protected metal sheet;



the improvement comprising: heating the asphalt-impregnated, fibrous-bonded, metal-coated core sheet to a temperature between 280° to 400° F. prior to recoiling and thereafter carrying out the said recoiling between 250° and 400° F.

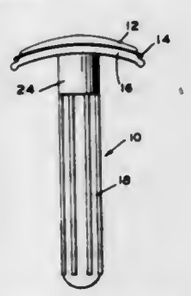
3,274,680
METHOD OF TYING TOGETHER A PLURALITY OF BODIES
William C. Cruse, Chippawa Lake, Ohio, assignor to The Akron Products Company, Seville, Ohio, a corporation of Ohio
Filed June 14, 1963, Ser. No. 288,018
3 Claims. (Cl. 29—509)

1. The method of anchoring or tying together at least two bodies having openings therethrough and in alignment with one another, which method consists in extending an end of a tie rod through the openings to a position where one end of the rod extends beyond one body, then slipping a self-gripping nut on the extended end of the rod and effecting movement of the nut to a position in which it bears against said one body, and then bending the other end of the rod into clinching engagement with the other body.



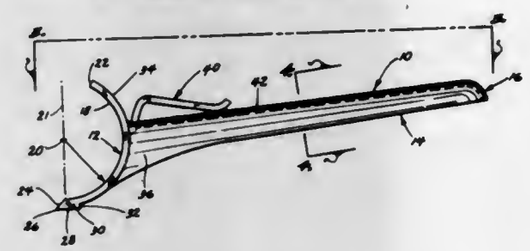
3,274,681
METHOD OF FORMING CLAD METAL
Gordon R. Lohman, Glen Ellyn, Ill., assignor to Amsted Industries Incorporated, Chicago, Ill., a corporation of New Jersey
Filed June 12, 1964, Ser. No. 374,703
6 Claims. (Cl. 29—528)

1. A method of cladding metal in a mold open at both ends comprising the steps of introducing a quantity of molten cladding metal up into the mold through the bottom opening thereof to achieve a predetermined interface level with the atmosphere by applying fluid pressure to a reservoir of said molten cladding metal, retaining the cladding metal in the mold by maintaining said fluid pressure until a surface portion freezes and forms a shell, displacing the remaining molten portion of the cladding metal downwardly from the central portion of the mold by introducing molten core metal into the mold through the top opening thereof against said fluid pressure while maintaining said atmosphere/molten metal interface level in the mold, and permitting said core metal to freeze to produce a solidified body after all the remaining molten cladding metal has been displaced.



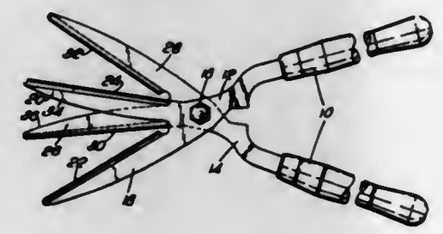
2. A method of producing a clad metal sheet comprising forming a billet according to the method of claim 1 and thereafter rolling the billet into a thin sheet in an operation that reduces the thickness of the core metal and cladding metal proportionately.

3,274,682
RAZOR WITH SOUND DETECTING MEANS
John H. Worthington, 108 Mohican Court, West Lafayette, Ind.
Filed Feb. 28, 1964, Ser. No. 348,037
4 Claims. (Cl. 30—34)



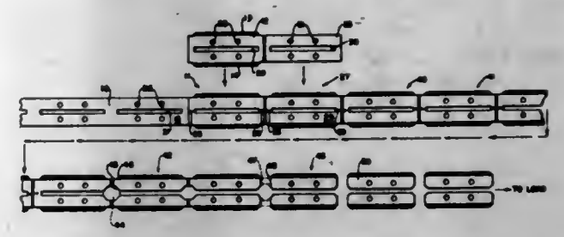
1. A razor for shaving comprising
(a) a handle,
(b) a blade
(1) removably carried by said handle, and
(2) having a sharp edge projecting outwardly from said handle in operative position to cut hairs in a shaving operation,
(c) means carried by said handle in position to pick-up vibrations of said blade,
(d) a speaker, and
(e) means operatively connected to said first-mentioned means for operatively actuating said speaker in accordance with such vibrations of said blade picked up by said first-mentioned means and thereby convert said vibrations to sound emitting from said speaker.

3,274,683
PLASTIC DISPOSABLE SAFETY RAZOR HAVING SEPARABLE PARTS RELEASABLY SECURED TOGETHER
Leonard W. Sachs, Grosse Pointe, Mich., assignor to Sachs Safety Razor Co., Inc., Detroit, Mich., a corporation of Michigan
Filed Oct. 26, 1964, Ser. No. 406,977
4 Claims. (Cl. 30—51)



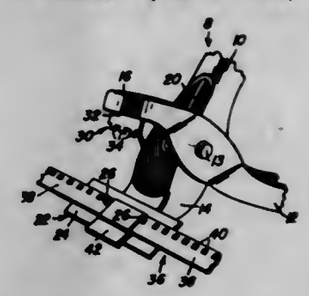
1. A disposable razor comprising a head, blade and guard member secured together in assembly, a handle projecting from said guard member at right angles thereto, and a connection between said guard member and handle comprising a socket on said guard member having a generally cylindrical cavity therein, said handle having a generally cylindrical inner end portion adapted to rotatably fit in said socket, a shoulder separating said inner end portion of said handle from the remainder thereof, said handle also having a locking lug projecting laterally outwardly from the generally cylindrical inner end portion thereof, said cavity in said socket having a longitudinally extending groove and at the inner end of said groove a circumferentially extending generally helical ramp, said groove being of sufficient width to clear said locking lug, whereby said inner end of said handle can be inserted in said cavity and during such insertion the longitudinal groove will clear said locking lug, and said handle can be thereupon rotated causing said locking lug to climb said ramp and draw said handle shoulder against the end of said socket to frictionally retain said handle.

3,274,684
SCRAPER DEVICE
William J. Marks, 5348 W. Lazy Heart St., Tucson, Ariz.
Filed Dec. 17, 1964, Ser. No. 419,147
8 Claims. (Cl. 30—171)



1. A scraper device, comprising,
a cutting blade having a concave front surface, said blade terminating along its lower edge in a rearwardly tapering front surface when said blade is substantially vertically disposed, a shoe surface defining a cutting edge with the lower edge of said blade and extending rearwardly from the lower edge of said tapering front surface and terminating in a substantially vertically disposed rear cutting surface, and
an elongated handle member secured to the back surface of said cutting blade, said handle member extending rearwardly of said front surface.

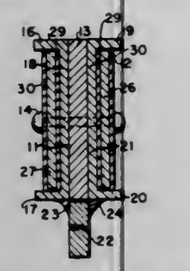
3,274,685
CUTTING APPLIANCES
Arthur William Knox, Longford, West Drayton, England, assignor to Mitchel & King Limited, Slough, England
Filed Aug. 12, 1963, Ser. No. 301,253
Claims priority, application Great Britain, Aug. 16, 1962, 31,418/62
2 Claims. (Cl. 30—211)



1. Hedge trimming shears comprising two stems joined together by a pivotal connection, each stem carrying inner and outer cutting blades which are splayed apart to form an acute angle on one side of the pivotal connection, said stems also carrying handles extending on the opposite side of the pivotal connection, the outer blade of each stem extending in substantial alignment with its corresponding handle, an open position of the blades having both blades on one stem disposed to one side of both blades of the other stem wherein none of the blades overlap any other blade, and the cutting edges of the blades of one stem facing the cutting edges of the blades of the other stem, whereby on closing the stems three cuts are obtained.

3,274,686
LAMINATED RAZOR BLADE FOR INJECTOR RAZOR
Jan Dawidowicz, Fairfield, Conn., assignor to Eversharp, Inc., Milford, Conn., a corporation of Delaware
Filed Mar. 2, 1965, Ser. No. 436,438
3 Claims. (Cl. 30—348)

1. A laminated razor blade for use in an injector razor comprising a thin flat metal razor blade of resiliently flexible material having a thickness of no greater than about .005 inch, a cutting edge formed along at least one elongated edge of said blade, a thin flat reinforcing strip having a thickness from about .003 to about .008 inch attached to at least one of the flat surfaces of the blade with their respective broad faces in a face-to-face adhesive bond to define a composite blade having a combined flat and uniform thickness with the end edge of the blade and reinforcing strip defining with their combined thickness an edge surface area sufficient for abutting contact with a corresponding edge surface area on the edge of a similar blade, one side edge of the reinforcing strip extending parallel to but spaced from the cutting edge, whereby the cutting edge extends from the side edge of the reinforcing strip an extent sufficient to extend the cutting edge out of the head of the razor in safety cutting position relative to the safety guard of an injector razor.



3,274,687
MOTION PICTURE FILM SPLICING TAPE PUNCH
Roger C. Le Blanc, 138 N. Brandywine Ave., Schenectady, N.Y.
Filed Nov. 13, 1964, Ser. No. 410,887
5 Claims. (Cl. 30—360)

1. In combination with a strip of film including a pair of end aligned sections with uniformly and longitudinally spaced sprocket holes formed therein in at least one pair of corresponding edge portions of said sections and a piece of splicing tape secured to at least one side of said strip throughout an area extending longitudinally of said strip a distance greater than the distance between two adjacent sprocket holes formed in said strip, a motion picture film splicing tape punching tool comprising a pair of jaws operatively interconnected for relative guided movement toward and away from each other, a die on one of said jaws for receiving the film thereon, said die having spaced openings therein with which the sprocket holes formed in said strip and disposed in said area are registrable, positioning means on said die engaging and positioning said strip in predetermined position on said die with the sprocket holes in said area registered with said openings, and punch means on the other jaw projecting outwardly thereof toward said one jaw and cooperable

with the openings in said die for punching through said tape in the portions thereof covering said holes in said area upon movement of the other jaw toward said one jaw.

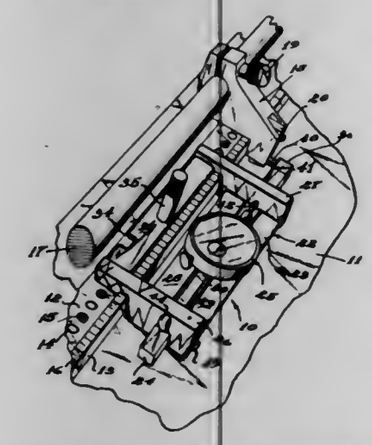
3,274,688
CABLE JOINTING TEMPLATE
Joseph B. O'Mara, Hastings on Hudson, and Ralph G. D'Ascoli, Yonkers, N.Y., assignors to Anaconda Wire and Cable Company, a corporation of Delaware
Filed Feb. 8, 1965, Ser. No. 431,032
1 Claim. (Cl. 33—112)

A template for tapering the insulation at a joint in a high-voltage cable comprising:

(A) an aluminum bar having opposing flat surfaces sufficient in extent for guide lines for said template,

(B) two extruded aluminum channels, each having a web and two flanges, fastened to said bar, the webs of said channels each being mounted against one of the opposing flat surfaces of said bar,

(C) a positioning projection fixed to one end of said template in the plane of said bar and substantially at right angles thereto,



(D) two blue-print paper strips,

(a) each being bonded to the exposed surface of the web of one of said channels,

(b) said strips bearing guide lines for tapering said insulation, and

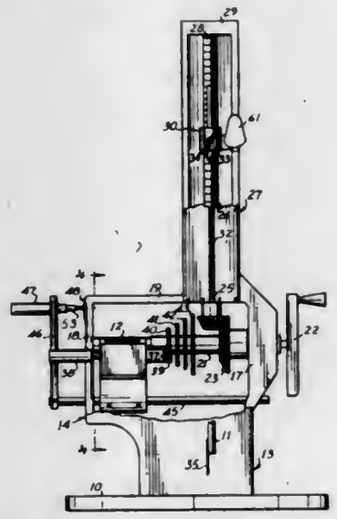
(E) transparent, abrasion-resistant resin coatings covering said strips.

3,274,689
GAGING APPARATUS FOR A MACHINE TOOL
Arthur K. Schott, Clarence, N.Y., assignor to Houdaille Industries, Inc., Buffalo, N.Y., a corporation of Michigan
Filed Apr. 1, 1963, Ser. No. 269,461
9 Claims. (Cl. 33—125)

2. A structure for positioning a part with respect to a predetermined reference point, comprising in combination:

(a) an elongated rigid means having a series of aligned locating holes spaced predetermined distances from said reference point;

(b) a rigid rail bar secured in parallel spaced axially fixed relation to said elongated rigid means;



(c) a workpiece-locating stop slidably supported on only said rail bar and clampable thereto, said stop including a finger part having a workpiece-engaging surface extending perpendicularly to said rail bar;

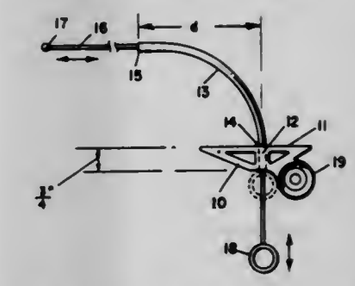
(d) a holder having a locating plug receivable in any one of said locating holes;

(e) a movable slide bar guided only by said holder and having a reference surface engageable by said workpiece-engaging surface of said finger; and

(f) a direct-reading gage coactive with said holder and said slide bar for indicating the distance that said workpiece-engaging surface is disposed from a basic position.

3,274,690
DEVICE FOR MEASURING LIQUID IN CONTAINERS
Robert E. Beverly, Jr., Atlanta, Ga., assignor to Zac-Lac Paint & Lacquer Corp., Atlanta, Ga., a corporation of Georgia
Filed July 24, 1963, Ser. No. 297,441
3 Claims. (Cl. 33—126.7)

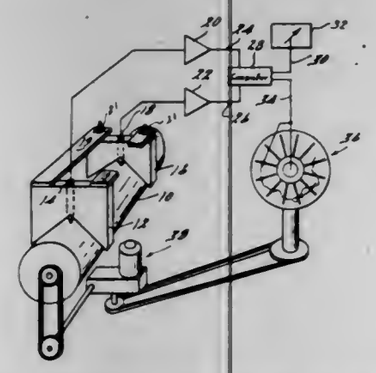
1. A device for measuring the volume of liquid in pint, quart, half gallon, or gallon containers in terms of the same particular volume of liquid measurement, said device comprising, in combination, a horizontal platform; a gear housing fixedly positioned adjacent to the platform having a left end panel with a slot, a right end panel, a front panel with a window, and a top panel; a vertical casing extending from the top panel of the gear housing perpendicular to the horizontal platform and having a vertical slit in its side; a gear axle extending within the gear housing between the left end panel and the right end panel of the gear housing; a screw within the vertical casing perpendicular to the gear axle and having a lower end which extends into the gear housing; a bevel gear having its pinion on and rotatable with the gear axle and its ring on and rotatable with the lower end of the screw; a sleeve positioned on the screw and vertically movable in response to the rotation of the screw; an arm fixedly attached at one end to the sleeve, extending horizontally through the slit, and having its extending end over the platform; a collar fixedly attached to the extending end of the arm; a rod fixedly, but movably inserted through the collar, said rod extending perpendicular to and toward the platform and having a lower end; a plate fixedly attached to the lower end of the rod and having an edge substantially parallel to the platform with a notch in it; a counter pin extending between the left end panel and the right end panel parallel to the gear axle, said counter pin being rotatable and slidably movable along its length; a counter having a counter shaft, indicia which change with revolutions



of the counter shaft, and a clearing pin which changes the indicia to zero when rotated, said counter being fixedly positioned on and movable with the counter pin and having its counter shaft extending parallel to the gear axle toward the right end panel, its clearing pin extending through the slot in the left end panel, and its indicia visible through the window of the front panel; a gear wheel on and rotatable with the extending end of the counter shaft; a lever extending perpendicular to the counter pin and having a first end and a second end fixedly attached to that end of the counter pin extending through the left end panel; a peg fixedly positioned in the first end of the lever and having an end extending toward the left end panel of the gear housing, said peg having a first segment with a diameter and a length, a second segment between the first segment and the lever and with a diameter greater than the diameter of the first segment and a length, a third segment between the second segment and the lever and with a diameter greater than the diameter of the second segment and a length, and a fourth segment between the third segment and the lever and with a diameter greater than the diameter of the third segment and a length; a scale fixedly mounted on the left end panel of the gear housing and having four recesses located along the arc described by the first segment of the peg when the lever pivots with rotation of the counter pin, the first recess having a diameter substantially equal to that of the first segment of the peg, the second recess having a diameter substantially equal to that of the second segment of the peg and being a first straight line distance from the first recess, the third recess having a diameter substantially equal to that of the third segment of the peg and being a second straight line distance from the second recess, and the fourth recess having a diameter substantially equal to that of the fourth segment of the peg and being a third straight line distance from the third recess; four drive wheels on and rotatable with the gear axle, the first drive wheel having a position along the length of the gear axle which places it in engagement with the gear wheel when the first segment of the peg is in the first recess in the scale, the second drive wheel being positioned on the gear axle between the first drive wheel and right side panel of the gear housing a distance from the first drive wheel equal to the length of the second segment of the peg and having a diameter larger than the diameter of the first drive wheel by an amount equal to the straight line distance between the first recess and the second recess, the third drive wheel being positioned between the second drive wheel and the right side panel a distance from the second drive wheel equal to the length of the third segment of the peg and having a diameter greater than the diameter of the second drive wheel by an amount equal to the straight-line distance between the second recess and third recess, the fourth drive wheel being positioned between the third drive wheel and the right side panel of the gear housing a distance from the third drive wheel equal to the length of the fourth segment of the peg and having a diameter greater than the diameter of the third drive wheel by an amount equal to the straight-line distance between the third recess and the fourth recess, and the diameters of the four drive wheels being such that a point on the first drive wheel travels a specific distance as the rod moves a vertical distance equal to the change in the surface level of a liquid in a pint container when the particular volume of liquid is added, a point on the second drive wheel travels the same specific distance as the rod moves a vertical distance equal to the change in the surface level of a liquid in a quart container when the particular volume of liquid is added, a point on the third drive wheel travels the same specific distance as the rod moves a vertical distance equal to the change in the surface level of a liquid in a half gallon container when the particular volume of liquid is added, and a point on the fourth drive wheel travels the same specific distance as the rod moves a vertical distance equal to the change in surface level of a liquid in a gallon container when the particular volume of liquid is added; and means for rotating the gear axle.

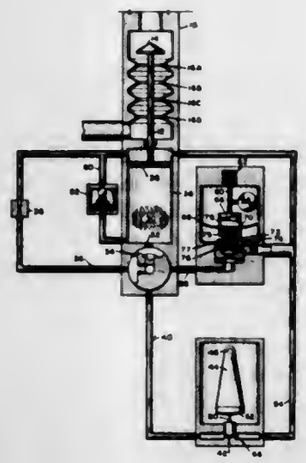
3,274,691
FLUID LEVEL INDICATORS
Charles P. Bolles, Dearborn, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 6, 1964, Ser. No. 380,387
10 Claims. (Cl. 33—126.7)

1. A fluid level indicator comprising, in combination, an elongated element adapted to be inserted into a container of a fluid whose level is to be indicated, temperature responsive means so positioned on the element as to be sensitive to the temperature of the fluid, and a fluid level indicating scale positioned on the element so as to be immersible in the fluid and adapted to be maneuvered on the element by the temperature responsive means distances reflecting the influence of the fluid temperature on the fluid level indicated by the scale.



3,274,692
STUD LOCATING DEVICE
Thomas E. Morrison, 2658 Butler, Los Angeles, Calif.
Filed Jan. 14, 1964, Ser. No. 337,634
1 Claim. (Cl. 33—169)

A stud locating device comprising, in combination; a body member having an elongated straight surface portion for engaging the flat surface of a wall and including an elongated wire guide tube having an inlet end secured to said body, said wire guide tube extending away from said straight surface portion and curving to terminate in an outlet end facing in a direction generally parallel to the direction of elongation of said straight surface portion so that the direction of said outlet end may be determined by the direction of said elongated straight surface; and a flexible wire received in said wire guide tube and of a



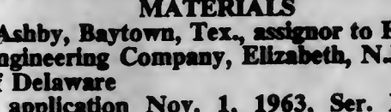
length greater than the length of said wire guide tube so that the ends of said wire extend from said outlet and inlet ends of said wire guide tube whereby said wire guide tube may be passed through a small hole in said flat surface of said wall until said straight surface portion engages said flat surface, said straight surface portion being oriented at right angles to a stud in said wall to be located so that said outlet end is directed towards said stud, said wire then being urged through said wire guide tube until its end passing from said outlet end of said wire guide tube engages said stud in said wall, thereafter said wire guide tube being withdrawn and said stud being located by noting the extent that said wire was urged through said wire guide tube, and in which said wire is guided into said inlet end of said wire guide tube at a point on said body spaced a distance from said straight surface portion equal substantially to one-half the thickness of said stud, the end of said wire from the outlet end of said wire guide tube terminating in an enlargement constituting a stop whereby the center of said stud may be located by retracting said wire back through said wire guide tube after the end of said wire has been urged into engagement with said stud, until said stop engages said outlet end of said wire guide tube, the portion of wire adjacent said point on said body being noted prior to retraction so that said point may be disposed at said hole in said wall after removal of said wire guide tube from said hole with said retracted portion of said wire lying in the direction of said stud, the outlet end of said wire guide tube then denoting the center of said stud.

3,274,693
METHOD AND APPARATUS FOR ROUNDNESS MEASUREMENT
Frederick W. Witzke, Cleveland, Ohio, assignor to The Bendix Corporation, Ann Arbor, Mich., a corporation of Delaware
Filed Feb. 4, 1965, Ser. No. 430,371
6 Claims. (Cl. 33—174)

1. A roundness gage for measuring the radial deviation of objects comprising:
a first three pronged V-angle device having a predetermined included angle,
a second three pronged V-angle device having a predetermined included angle different than the included angle of said first device, reciprocably mounted relative to said first device,
first and second displacement transducers respectively mounted in fixed angular relation to said first and second devices adapted to measure the radial displacement of the periphery of said objects relative to said devices, and
means connected to said transducers for factoring the outputs therefrom and combining said outputs to provide a single output indicative of the actual radial deviation of said objects.

3,274,694
APPARATUS FOR MEASURING THE AZIMUTH AND INCLINATION OF A BOREHOLE
Alexander B. Hildebrandt, Tulsa, Okla., assignor, by mesne assignments, to Esso Production Research Company, Houston, Tex., a corporation of Delaware
Filed July 15, 1964, Ser. No. 382,783
14 Claims. (Cl. 33—205)

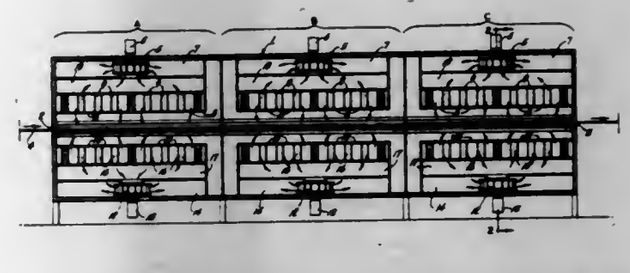
5. A drilling drift indicator for use in drilling a borehole which comprises:
a housing member, said housing member having a first passage means for conveying fluid from one end of the housing member to the other end, one portion of said passage means having a first restriction, a second restriction, a third restriction, and a fourth restriction, such restrictions being equally spaced;
a first hydraulic fluid cylinder within said housing member and having an upper and a lower end;
a pendulum compartment within said housing member;
a compass compartment within said housing member;
a plunger rod within said housing member extending at least from said first restriction downwardly through the upper end of said cylinder;
a cap means mounted on the upper end of said plunger rod;
a piston mounted on the lower end of said plunger rod and within said cylinder;
means biasing said piston upwardly within said chamber;
a discharge conduit in fluid communication with the cylinder beneath said piston;
a first conduit means establishing fluid communication between said discharge conduit and the interior of said cylinder above said piston, said first conduit means having a fixed restriction therein;
a second conduit means having a variable restriction therein and connecting said discharge conduit with said cylinder above said piston;
a third conduit means establishing fluid communication between said discharge conduit and the interior of said cylinder above said piston;
a pendulum pivotally supported within said pendulum compartment;
means to vary the restriction within said second conduit means in response to the position of said pendulum within said pendulum compartment;
a rod loaded with an eccentric weight and rotatably mounted within said compass compartment;
means to restrict the flow within said third conduit means as a function of the position of the eccentric weight;



a first dampening fluid within said pendulum compartment;
a second dampening fluid within said compass compartment;
means for equalizing the pressure of said first dampening fluid and said second dampening fluid with that of the pressure within said cylinder above said piston;
valve means having three positions, one position fluidly connecting said discharge conduit with said first conduit means, a second position connecting said discharge conduit with said second conduit means and a third position connecting said discharge conduit with said third passage means;
means to actuate said valve means such that said valve is in its first position when said cap means is between said first and said second restriction, in its second position when said cap means is between said second and third restrictions and in its third position when said cap means is between its third and fourth restrictions;
a second passage means between the cylinder above said piston and the first passage means for conveying drilling fluid through the tool; and
a diaphragm within said second passage means.

3,274,695
LEVEL AND RULE COMBINATION
Dominick Aiola, 112 Church St., Box 214, Washington, Pa.
Filed Mar. 14, 1963, Ser. No. 265,208
1 Claim. (Cl. 33—215)

In a brick mason type of level and rule combination having a longitudinal slot which is relatively short compared to the length of the level and rule combination, a longitudinally extending container within said slot, a plumbing device in said container comprising a plumb bob universally suspended from one end of said container, cross-hairs formed at the other end of said container and cooperable with said plumb bob, and liquid in said container for damping movements of said plumb bob, whereby inclinations of said rule in any direction radially of the longitudinal direction may be detected, said rule having a wooden body portion provided with concave opposed outer surfaces of greatest width, edge surfaces of smaller width which are also concave and provided with central well portions extending along the length of the level and being covered by metallic shields for use as guides for plumbing corners of buildings.

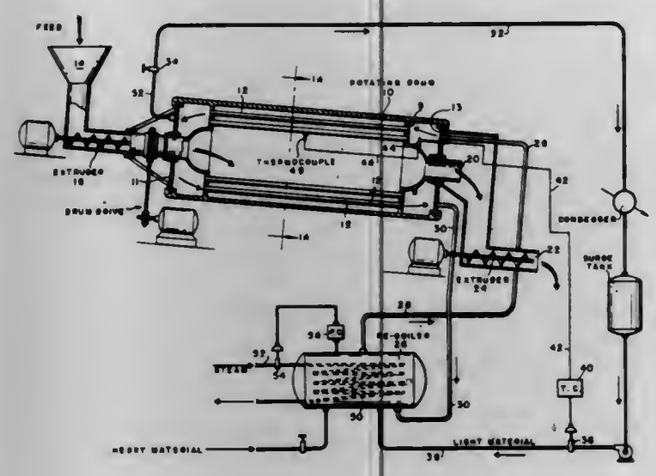


3,274,696
GYROSCOPIC COMPASSES
Douglas Barnett, Northwood, and David Langton Brook, Watford, England, assignors to S. G. Brown, Ltd., Watford, England, a company of Great Britain
Filed July 19, 1965, Ser. No. 472,998
11 Claims. (Cl. 33—226)

1. A method of checking azimuthal deviation of a gyroscopic compass from its settled position, which comprises the steps of generating in the compass a pendulum signal variable with the degree of the deviation; substantially suppressing from said pendulum signal may superposed components therein resulting from periodic movements such as may be caused by pitching and rolling of the body on which the compass is mounted and which are of a high

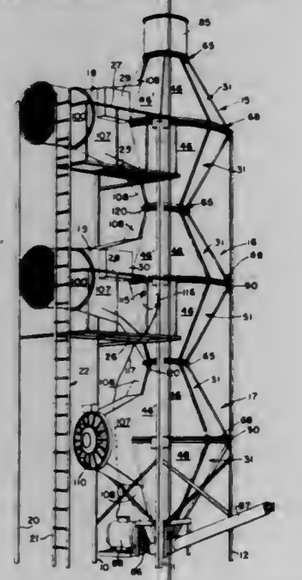
frequency, transient nature relative to the frequency of azimuth deviations represented by said pendulum signal; and employing the remaining component of said pendulum signal to provide an indication of the angle of azimuthal deviation.

3,274,697
METHOD FOR CONDITIONING WEB- OR SHEET-LIKE MATERIAL
Arent Aronsson, Nacka, Sweden, assignor to Aktiebolaget Svenska Flaktfabriken, Stockholm, Sweden
Filed Mar. 2, 1964, Ser. No. 349,535
7 Claims. (Cl. 34—36)



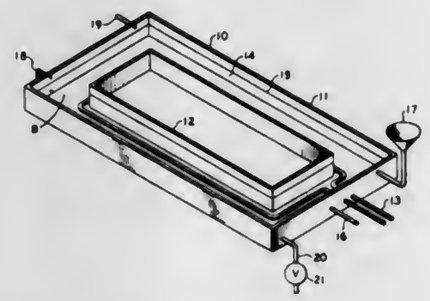
1. A method of conditioning web or sheet-like material in a chamber comprising the steps of: feeding the material to be treated through said chamber, blowing a heated, moist, gaseous medium against one surface of the material, blowing a cold, moist, gaseous medium against the opposite surface of said material to thereby conduct away the heat released by the condensation of moisture in and on the material.

3,274,698
APPARATUS FOR DRYING PARTICULATE MATERIALS
Billy B. Ashby, Baytown, Tex., assignor to Esso Research and Engineering Company, Elizabeth, N.J., a corporation of Delaware
Original application Nov. 1, 1963, Ser. No. 320,898. Divided and this application Nov. 18, 1965, Ser. No. 508,441
6 Claims. (Cl. 34—48)



1. In an inclined tube heat exchanger having a rotating drum, upper and lower tube sheets within and depending from said drum, a plurality of tubes extending longitudinally within said drum and depending from said upper and lower tube sheets, upper and lower stationary heads sealingly connected to said drum for allowing rotative movement of said drum relative thereto, means for charging a particulate material into said drum through an inlet at said upper stationary head, and means for discharging said particulate material from said drum at an exit at said lower stationary head, the improvement of
vapor inlet means in the upper portion of said lower stationary head,
condensate outlet means in the lower portion of said lower stationary head,
vent means in said upper stationary head,
reboiler means including heating means,

means for sensing the vapor pressure within said reboiler,
means responsive to said vapor pressure sensing means for controlling said heating means,
bleed conduit means fluidly connecting said vent means with said reboiler,

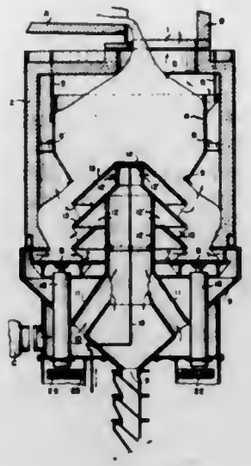


condenser means in said bleed conduit means,
condensate conduit means fluidly connecting said condensate outlet with said reboiler,
and vapor conduit means fluidly connecting said reboiler with said vapor inlet means.

3,274,699
UPRIGHT CROP DRYER
Straut W. Naylor, 302 Miller St., P.O. Box 395, Sterling, Ill.
Filed Oct. 23, 1963, Ser. No. 318,356
16 Claims. (Cl. 34—56)

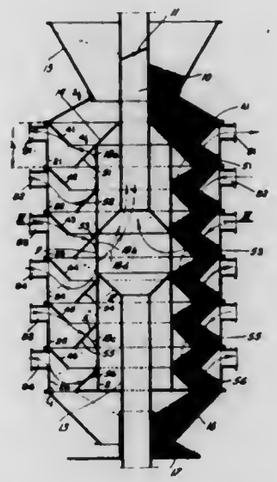
13. An upright drying chamber structure for a crop dryer comprising: an inner perforated conical-shaped wall; having a large base and small top; an inwardly extending flange projecting from the base; an external upright conical-shaped perforated wall formed about the axis of the inner conical-shaped wall and spaced therefrom, and having a relatively small annular upper end and a relatively large horizontal base; and outwardly extending flanges at the upper end and base; radially extending upright panels traversing the spacing between the inner and outer walls and having opposite inclined edges fixed to the inner and outer walls and defining therewith a series of upright compartments, said upright panels having openings therein for affording communication between the compartments.

3,274,700
GENERATING APPARATUS FOR USE IN REMOVING FLAMMABLE MATERIALS FROM DUCTS
Edward J. Maguire, Sr., 4 Jochum Ave., Larchmont, N.Y.; Eugene F. Maguire, 10 Ellsworth Road, Larchmont, N.Y.; and Edward J. Maguire, Jr., 160 Theodore Fremd Ave., Rye, N.Y.
Original application June 21, 1960, Ser. No. 37,617. Divided and this application July 1, 1965, Ser. No. 483,385
1 Claim. (Cl. 34—104)



A portable gas-generating apparatus useful in removing flammable materials from the interior surfaces of a stationary duct, which apparatus comprises a horizontally disposed trough having endless inner and outer substantially vertically disposed wall sections and an endless substantially horizontally disposed base section, said endless inner wall defining an opening of sufficient cross-sectional area to permit passage of gas therethrough and said inner, outer and base sections defining an endless open-topped channed adapted to contain a fire-resistant solvent liquid which is to be converted to the gaseous state, an electrical heating element positioned in the lower portion of the trough and located in a generally parallel relationship with the base section, said heating element, upon activation, effecting controlled generation of solvent gas from the fire-resistant solvent liquid contained in the open-topped channel, a releasable flexible duct secured at its upper portion to the lower peripheral edge of the stationary duct and at its lower portion to the outer wall section of the trough, and means provided on the trough to allow rolling movement thereof.

3,274,701
STATIONARY CIRCULAR CONTACT COOLER FOR CALCINED LIME AND OTHER MATERIALS
Gerhard Niemitz, Bronx, N.Y., assignor to Kennedy Van Saun Mfg. & Eng. Corp., New York, N.Y., a corporation of Delaware
Filed Mar. 3, 1964, Ser. No. 349,107
10 Claims. (Cl. 34—164)

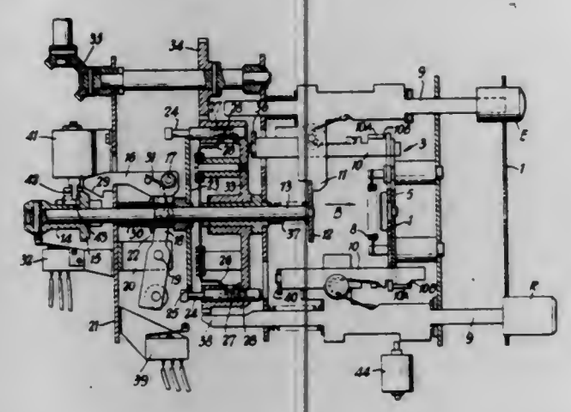


1. In a cooler for hot calcined material such as that of lime, cement and the like, including an upright insulated shell having an opening at its upper end for receiving hot calcined material from a kiln, a metal shell located in the upper portion of the insulated shell and spaced from its inner surface for receiving said material falling through said opening and providing a soaking chamber therefor, an air distributor located at the lower portion of said metal shell and providing therewith an annular passageway for material to be cooled to flow over the air distributor, means for supplying air to said distributor, means defining an annular outlet passageway for cooled material at the lower part of the air distributor,

an annular disc below said outlet passageway for supporting the material along the distributor, and means for

moving said disc to feed and discharge cooled material therefrom.

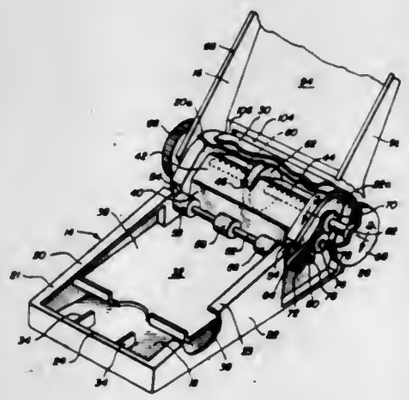
3,274,702
OVENS FOR TREATING COMPRESSED COAL BRIQUETTES
Gustave Kleinberg, 229 Blvd. Raspail, Paris, France
Filed May 31, 1963, Ser. No. 284,683
Claims priority, application France, June 4, 1962, 899,652
1 Claim. (Cl. 34—171)



A kiln for the thermal treatment of briquettes comprising a housing including a first cylinder concentric with and enclosed in a second cylinder, said first cylinder having a perforated opening near the center thereof, said cylinders being arranged in spaced relation to define an annular space therebetween, an opening at the upper end of said housing for permitting introduction of said briquettes into said annular space and an opening at the lower end of said housing for discharging said briquettes therefrom, a plurality of first baffle members having edge portions secured to the perimeter of said first cylinder and spaced in a vertical direction relative to each other, the alternate of said first baffle members being perforated to allow gases to pass therethrough, a plurality of imperforate second baffle members having edge portions secured to the inner wall of said second cylinder and spaced in a vertical direction relative to each other, said first and second baffle members comprising a series, the alternate ones of which project in opposite directions, said first and second baffle members further arranged such that the free edge portion of said first baffle members describe a series of circles of equal radius and the free edge portions of said second baffle members describe a series of equal circles of greater radius than that of said first baffle members with the free edge portions of all of said baffle members lying in a horizontal plane intersecting the point of attachment of the opposite set of baffles, a first zone to heat the briquettes near the top of said kiln having inlet openings in said second cylinder near the upper end thereof for introducing the heating gases into said housing between the point of securement and free edge portions of the second baffle member from the top of said second cylinder, whereby the gases pass below said second baffle member upwardly through the briquettes, and one of the perforated baffle members mounted on said first cylinder, thence again through the briquettes, under the topmost baffle mounted on said second cylinder, and out through openings provided above the free edge portion of said topmost baffle member in the second cylinder whereupon the said gases exit from the kiln; a second zone to treat said briquettes near the center of said kiln having inlet openings in said second cylinder near the center thereof for introducing gases to treat the briquettes between the point of securement and free edge portions of the third baffle from the top of said second cylinder, whereby the gases pass below said third baffle member downwardly through the briquettes, through a second perforated baffle member mounted on said first cylinder adjacent to said perforated opening in said first cylinder to selectively permit a portion of said treating gas to exit from the kiln through said first cylinder and the remaining treating gas through the briquettes under the fourth baffle member mounted on said second cylinder, and out through openings provided above the free edge portion of said fourth baffle member, a flap valve mounted within said first cylinder for controlling the amount of treating gases exiting through said first cylinder; a third zone to cool said briquettes prior to discharge from said kiln having inlet openings in said second cylinder near the bottom thereof for introducing cooling gases into said housing between the point of securement and free edge portions of the fifth baffle member from the top of said second cylinder, whereby the gases pass below said fifth baffle member downwardly through the briquettes, through a third perforated baffle mounted on said first cylinder, thence again through the briquettes under the sixth baffle member mounted on said second cylinder, and out through openings provided above the free edge portion of said sixth baffle member in the second cylinder, whereby the briquettes receive homogeneous treatment to produce a uniform product.

3,274,703
TEACHING MACHINES
Arthur Robert Brian Pavey and Alexander Puchnarewicz, Welwyn Garden City, and James Katavolos, Richmond, England, assignors to U.S. Industries Inc. Engineering Limited, Burtonwood, Warrington, England, a British company
Filed Oct. 30, 1964, Ser. No. 407,767
Claims priority, application Great Britain, Nov. 1, 1963, 43,169/63
5 Claims. (Cl. 35—9)

1. In a teaching machine employing text recorded on successive frames of a film and having film transport mechanism for moving the film forwardly and backwardly past a viewing position, a mechanical selector mechanism for selecting the frame to be viewed, the selector mechanism comprising first means co-operating with the transport mechanism for initiating, when operated, forward movement of the film, second means co-

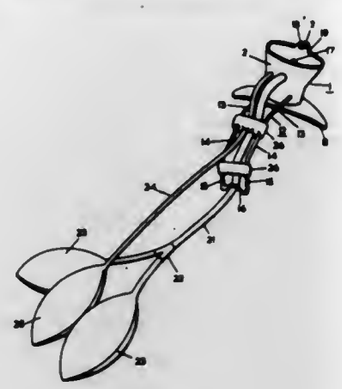


operating with the transport mechanism for initiating, when operated, backward movement of the film, a movable member connected to the transport mechanism for movement in correspondence with the film, a plurality of manually actuatable selector members for selecting a frame subsequent to the initial one to be moved to the viewing position, a manually actuatable return member for selecting the initial frame for return to the viewing position, locking devices associated one with each of the selector members and the return member for locking

the associated member, when actuated, in its actuated condition, a part carried by each selector member for operating the first initiating means when the associated member is actuated, a part carried by the return member for operating the second initiating means when the return member is actuated, and an element on said movable member for engaging, upon movement of the movable member, any locking device maintaining its associated member in its actuated condition for releasing the latter for return to its non-actuated condition whereby the operated initiating means reverts to its unoperated condition to stop movement of the film.

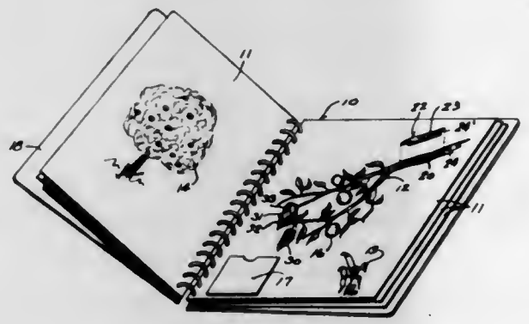
3,274,704
PORTABLE TEACHING MACHINES
Dudley E. Cornell III, Albuquerque, and Robert A. O'Connell, Cedar Crest, N. Mex., assignors to Teaching Machines, Inc., Albuquerque, N. Mex., a corporation of New Mexico
Continuation of application Ser. No. 206,992, July 2, 1962. This application May 3, 1965, Ser. No. 456,884
3 Claims. (Cl. 35—9)

1. In a teaching machine adapted for use with test sheets each bearing successive multiple groups of regularly disposed questions, answers, and answering areas,
a housing;
means for supporting a stack of test sheets within said housing;
means for collecting the test sheets in said housing;
means providing a movement path for test sheets from said supporting means to said collecting means;
a wall in said housing having a writing opening therein adjacent said movement path;
window panel means in said wall adjacent said movement path;
masking means on said wall adjacent said movement path;
a first rotatable shaft mounted on said housing over said stack of sheets and movable up and down thereover;
first roller means mounted on said first shaft rotatably therewith and resting on said stack of sheets for moving the top sheet from said stack to a position beneath said window panel means and said writing opening;
a second rotatable shaft mounted on said housing and spaced beyond said first shaft;
second roller means mounted on said second shaft rotatably therewith for moving said top sheet to said collecting means;
means for operating said first and second roller means synchronously including a manually operated knob and coupling means connected to said first and second shafts;
and a divider separating said coupling means from said sheet supporting means, said collecting means, and said movement path, said divider having openings therein and said first and second shafts projecting through said openings for connection to said coupling means, thereby separating said coupling means from test sheets being moved in said housing to prevent fouling;
whereby upon operating said knob, said top sheet is moved by said first roller means to a position wherein a question is visible through said window panel



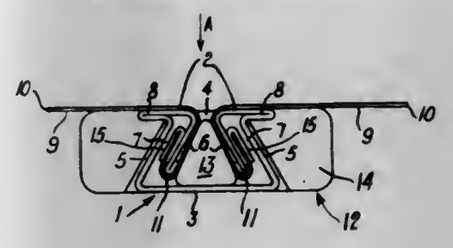
means, its answer is obscured by said masking means, and its answering area registers with said writing opening for writing the answer to said question on the answering area,
and thereafter said top sheet is advanced to move said answering area out of register with said writing opening and in a position visible through while rendered inaccessible by said window panel means, and the answer to said question is rendered visible through said window panel means for checking the written answer,
and thereafter said top sheet is advanced for writing the answers to successive questions and for checking the written answers thereto with said sheet disposed as aforesaid,
and said top sheet is moved by said second roller means to said collecting means after advancing past said window panel means,
and the remaining sheets in said stack are moved successively in like manner to said top sheet.

3,274,705
APPARATUS FOR PRACTISING AND TEACHING EXPIRED AIR ARTIFICIAL RESPIRATION
Francis Bertrand Breakspear, Emsworth, England, assignor to The British Oxygen Company Limited, a British company
Filed Aug. 20, 1963, Ser. No. 303,336
2 Claims. (Cl. 35—17)



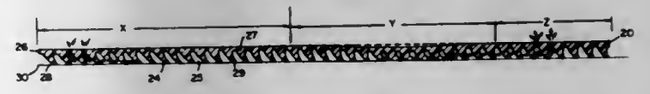
1. Apparatus for practising or teaching expired-air artificial respiration comprising a unit having a mouthpiece and associated nostril for use by a first person practising this method, first passage means connecting the said mouthpiece and associated nostril, support means whereby

the unit may be supported above the mouth of a second person in supine position acting as patient by the head of the said second person, an inflatable bag simulating a lung, second passage means connecting the mouthpiece and the first passage means to the said inflatable bag, and constricting means of substantially rigid material mounted on the unit and substantially rigidly attached to the support means and adapted to guide the second passage



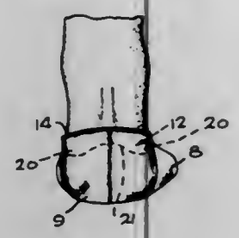
means towards the neck or chest of the second person in such a way that the second passage means is constricted by bearing against the body of the second person if the said second person in supporting the unit does not have his head tilted to the correct position in relationship to his body for expired-air artificial respiration, the constricting means being ineffective to cause constriction of the second passage means when the head of the said second person is correctly tilted.

3,274,706
BOOK HAVING PLASTIC PAGES AND ADHERENT PLASTIC OVERLAYS
Charlotte E. Friend, Milwaukee, Wis.
(311 S. Water St. East, Fort Atkinson, Wis.)
Filed Apr. 2, 1964, Ser. No. 356,730
1 Claim. (Cl. 35—20)



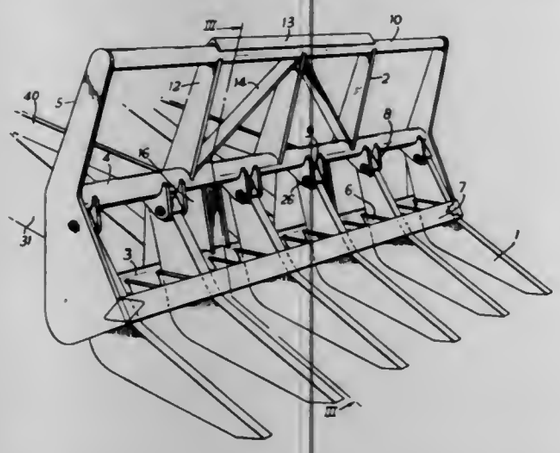
In combination, a page bearing a picture of a natural object, a portion of the picture area having a distinctive outline, and an overlay having a flat lower surface, said lower surface being permanently removable and mutually adherent to the page, at least the upper surface of said page and the lower surface of said overlay being comprised of plastics which are electrostatically adherent to each other, said overlay being further provided with an outline corresponding substantially exactly to the distinctive outline of said portion of the picture area, the upper surface of said overlay being provided with irregular surface features corresponding tactilely to the pictured portion of the natural object represented by said overlay and being colored like the said natural object, a plurality of said pages being bound into a book, said book being provided with a pocket adapted to store said overlays.

3,274,707
CONNECTING MEMBER FOR A BOARD FOR EDUCATIONAL PURPOSES AND A BOARD INCORPORATING SUCH A MEMBER
William Brownie Garden, Kilsyth, near Glasgow, Scotland, assignor to Wilson & Garden Limited, Glasgow, Scotland, a corporation of the United Kingdom of Great Britain and Northern Ireland
Filed Apr. 3, 1964, Ser. No. 357,227
Claims priority, application Great Britain, Apr. 4, 1963, 13,312/63
10 Claims. (Cl. 35—62)



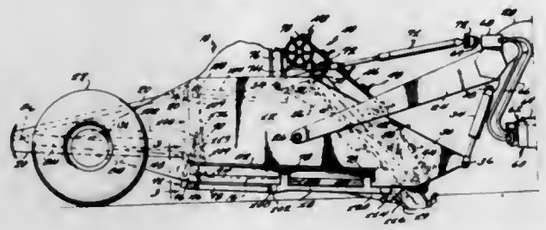
1. A connecting member for a board for educational purposes comprising a hollow bar of trapezoidal cross-section, a longitudinally extending slot formed in one side of the bar, and longitudinally extending channels so presented within said bar adjacent to the sides of said bar on either side of said slot as to be open to the interior of said bar adjacent to the side thereof remote from said side in which said slot is formed whereby the end portions of the sheet associated with the opposed ends thereof to be interconnected may be so located within said slot, with said ends, which present substantially rigid members, positioned within said channels, that insertion and removal of said end portions of the sheet into and from the bar, respectively, in other than the longitudinal direction are prevented.

3,274,708
AIR CIRCULATORY INSOLE
George A. Lukas, 4 W. Labonte Ave., Saco, Maine 04072
Filed Oct. 14, 1965, Ser. No. 495,855
1 Claim. (Cl. 36—3)



An insole for foot wear, comprising,
(a) a resilient body having an upper imperforate median surface,
(b) air intake ports disposed adjacent one distal end and extending transversely across said body,
(c) air discharge ports extending transversely across the other distal end of said body,
(d) a plurality of resilient support members extending downwardly from said body and angularly declined in the direction of said discharge ports, the angle of said support members with said body being greater than 90°,
(e) each of said support members extending completely across said body and being longitudinally spaced from each other defining compartments therebetween,
whereby said support members are deflected during walking directionally controlling the flow of air from the intake ports to the discharge ports.

3,274,709
FOOT COVER
John E. Lipinski, 116 Laurel Lane, Forest Brook Glen, Wilmington, Del.
Filed Aug. 30, 1965, Ser. No. 483,540
3 Claims. (Cl. 36—10)

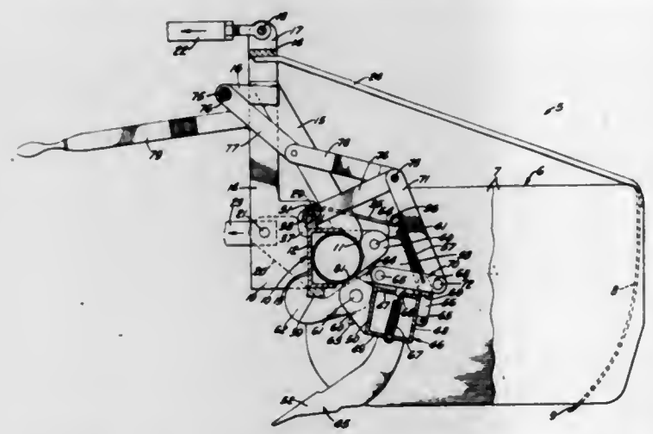


1. In a foot cover comprising a body of flimsy material formed to be stretched about a wearer's foot and including a heel portion, said body having a bottom wall and side walls having top edges defining a foot passing opening, means for reinforcing the heel portion of said body at and adjacent said top edge comprising a counter composed of relatively stiff, flexible material having its top edge conforming to and secured to the top edge of said body and having its lower portion symmetrically curved to define convexly curved end lobe portions and an intervening concavedly curved portion of a radius of curvature approximately twice the radius of curvature of each of said lobe portions; the maximum width of said lobe portions being not more than half the distance between the top edge and bottom portions of said body.

3,274,710
FORK STRUCTURES FOR PIVOTAL ATTACHMENT TO VEHICLE MOUNTED BOOMS
John Frederick Wright, White Owl, Hinton Martell, Wimbourne, Dorset, England
Continuation of application Ser. No. 243,475, Dec. 10, 1962. This application Jan. 5, 1965, Ser. No. 423,508
12 Claims. (Cl. 37—2)

10. A digging and carrying fork structure for digging in the ground and also carrying large objects while permitting smaller objects to pass therethrough, comprising: a plurality of parallel frame members, a plurality of parallel extending tines mounted perpendicular to said frame members, said frame members and tines presenting a generally dish-shaped form in side view, means for releasably securing said tines to said parallel frame members so that one end part of each tine is connected to a first of said parallel frame members, an intermediate part is held between a second of said parallel frame members and a retaining bar parallel to said second frame member, and another end part projects from said second frame member on the side thereof opposite said first frame member, said securing means comprising pairs of apertured lugs secured to said first frame member, the said one end part of each said tine being disposed between a pair of said apertured lugs and formed with an aperture in alignment with said aligned apertures of said lugs, a bolt which extends through said aligned apertures of said lugs and said tine to secure the said one end part of said tine relative to said first frame member.

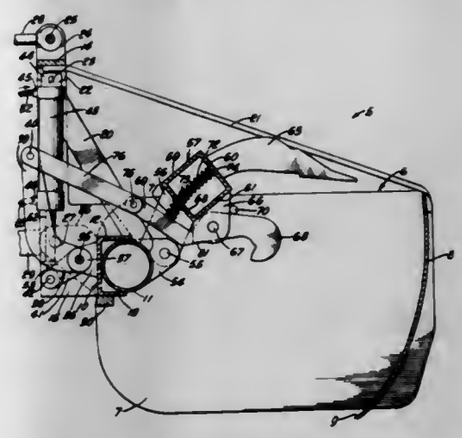
3,274,711
EARTH SCRAPER WITH RETRACTABLE BOTTOM WALL
Charles M. Johnson and James E. Lowder, Lubbock, Tex., assignors to Johnson Manufacturing Company, Lubbock, Tex., a corporation of Texas
Filed May 13, 1963, Ser. No. 279,987
14 Claims. (Cl. 37—129)



5. In an earth-moving apparatus which includes a mobile, open-front dirt-carrying container, a movable bottom wall section at the front of said container, means mounting said bottom wall section from said container for relative movement forwardly and readwardly, and a dirt-digging scraper blade carried by and disposed in advance of said movable bottom wall section the improvement comprising: auxiliary support means for restraining downward movement of the front of said wall section when said section is in its forwardmost position, said auxiliary support means including a first member carried by the forward portion of said wall section and a second member carried by said container at the forward end thereof in a position to be out of contact with said first member when said bottom wall is in a rearward position and to be engageable with at least the lower surface of said first member when said bottom wall section is in its forwardmost position, to prevent downward movement of said bottom wall section, said first and second members being disposed at the side of said apparatus out of the line of travel of dirt passing over said scraper blade.

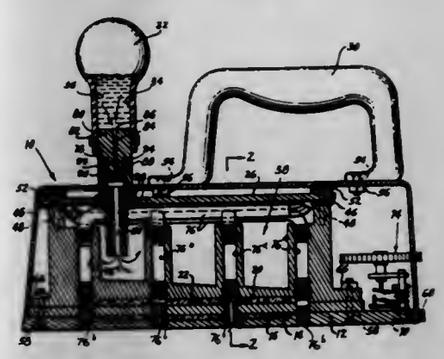
3,274,712
RETRACTABLE SCARIFIER
Dwight C. Jones, La Habra, Calif., assignor to Earthcavator Company, Inc., a corporation of California
Filed Apr. 16, 1964, Ser. No. 360,234
1 Claim. (Cl. 37—145)

A scarifier embodied in an earth scraping tool drawn by a powered tractor, said scarifier comprising: a draft beam adapted to be supported rigidly at its opposite ends on said tool; a scarifier bar having teeth attached thereto, said bar being arranged parallel with and generally rearwardly from said beam; pivotally connected lugs fixed on said beam and said bar at symmetrically spaced points thereon for pivotally mounting said bar on said beam on a transverse axis disposed between said bar and said beam whereby said bar is swingable between a downward teeth extending position and an upward teeth retracting position; striker plate means provided upon a forward lower edge of said beam; hook means disposed symmetrically with the central vertical fore-and-aft axial plane of said tool and pivotally mounted on said bar on a transverse axis between said striker plate means and said bar when the latter is in downward position, said hook means being adapted to hook upwardly over said



striker plate means when said bar is swung into its downward position; an arm integral with said hook means and extending rearwardly therefrom above said bar when the same is in downward position; spring means rotatively biasing said hook means and said arm about the axis of their pivotal mounting to move said hook means into hooking relation with said striker plate means when said bar is in downward position; a stop on said bar for limiting rotation of said hook means and said arm in an opposite direction and to a degree slightly past that necessary to unhook said hook means from said striker plate means; a first link, one end of which is pivoted to said arm close to the place where said arm is integrally joined with said hook means and on an axis above said bar when the same is in downward position, said link then extending rearwardly across said bar and having a lug underlying said arm whereby lifting on said link will lift on said arm and swing said hook means against said stop; a second spring means relatively biasing said bar to rotate

the same from its downward position to its upward position when said hook means is swung against said stop; and toggle means for applying power to swing said bar against the action of said second spring means and into its downward position, said means including a second link extending downwardly therefrom and pivotally joined at an obtuse angle at its lower end with the rear extremity of said first link when said bar is in its upward position whereby actuation of said toggle means to push said second link downward rotates said hook means and arm against the action of said first spring means and swings said hook means into engagement with said stop, whereupon further downward movement of said second link swings said bar against the action of said second spring means and into the downward position of said bar where a change thus caused in the angular relation between said links renders the first spring means effective in swinging said hook means upwardly into hooking relation with said striker plate means.



3,274,713
HYDRAULICALLY CONTROLLED SCARIFIER
Dwight C. Jones, La Habra, Calif., assignor to Earthcavator Company, Inc., a corporation of California
Filed Apr. 16, 1964, Ser. No. 360,248
5 Claims. (Cl. 37—145)

1. A scarifier embodied in an earth scraping tool drawn by a powered tractor, said scarifier comprising: a draft beam adapted to be supported rigidly at its opposite ends on said tool; a scarifier bar having teeth attached thereto, said bar being arranged parallel with and generally rearwardly from said beam; pivotally connected lugs fixed on said beam and said bar at symmetrically spaced points thereon for pivotally mounting said bar on said beam on a transverse axis disposed between said bar and said beam whereby said bar is swingable about said axis between a downward teeth extending position and an upward teeth retracting position; striker plate means provided upon a forward lower edge of said beam; hook means disposed symmetrically with the central vertical fore-and-aft axial plane of said beam and pivotally mounted on said bar on a transverse axis, said hook means being adapted to hook upwardly over said striker plate means after said bar has been swung into its downward position; a stop mounted on said bar; means for yieldably holding said hook means in non-locking position and in an engagement with said stop; and reversible hydraulically operable power means mounted on said beam and being connected by a rigid link to said hook means, said power means, when positively power actuated, holding sad bar, through said hook means, in upward position, said power means, when re-

versely power actuated, releasing said bar, permitting it to swing by gravity to its downward position the link connecting said power means and said hook means being effective, after said bar has reached said downward position, to positively overcome said yieldable means and swing said hook means upwardly into locking relation with said striker plate means, said power means holding said hook means in said locking relation until said power means is again positively actuated, whereupon, said power means relaxes its pressure holding said hook means in locking position, positively swings said hook means to non-locking position against said stop then returns said bar to its upward position and continues to hold said bar in said position.

3,274,714
STEAM IRON
Carlos Salomon Abraham, Rep. de Chile 43—16–A, Mexico City, Mexico
Filed Dec. 19, 1963, Ser. No. 331,705
3 Claims. (Cl. 38—77)

1. An iron comprising casing means having a top and a bottom, a sole plate secured to said bottom of said casing means and having a top surface and a bottom surface adapted for ironing, handle means secured to said top of said casing means, structural means defining a vaporizing chamber within said casing means above said sole plate, hollow open topped bosses extending upwardly from said sole plate and having means opening through said sole

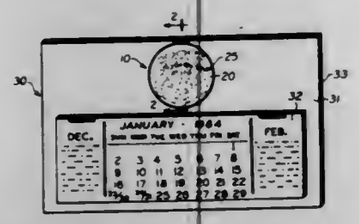


plate at their lower ends, said bosses extending into said vaporizing chamber, said vaporizing chamber having a bottom and a top, open-ended upwardly directed conduit means communicating between spaced points in said vaporizing chamber and the open tops of said bosses, reservoir means adapted to contain a quantity of water, means mounting said reservoir means externally of said casing, passageway means communicating between said reservoir means and said vaporizing chamber, heating means to heat said sole plate to an ironing temperature and said vaporizing chamber to a water vaporizing temperature, said heating means including a first heating unit juxtaposed to said sole plate, a second heating unit, juxtaposed to said bottom of said vaporizing chamber, and a barrier plate interposed between said first and second heating elements.

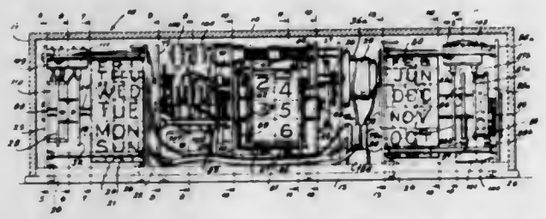
3,274,715
RECORD FILING DEVICE
Alexander Patton Janssen, Charlottesville, Va., assignor to Acme Visible Records, Inc., Crozet, Va., a corporation of Delaware
Filed Sept. 28, 1964, Ser. No. 399,553
2 Claims. (Cl. 40—102)



1. A record device comprising a plurality of flexible record panels, a spaced pair of hinges swingingly mounting each of said record panels, and a wire hanger, said hinges each being of uniform contour and comprising a flat main body portion, prongs extending integrally and return bent from one edge of said body portion and lying in plane parallel spaced relation to one face of said body portion projecting through and in engagement with one edge portion of said record panels, and an integral tubular portion at the opposed end of said body lying wholly on said one face and in engagement on said wire hanger and projecting over the engaged edge of the record panel, the length of said tube being greater than that of the adjacent flat main body portion of the hinge, the hinge tubes of one record panel being in substantial endwise abutment with the hinge tubes of an adjacent panel and freely pivotal with respect thereto.

3,274,716
INDICIA APPLICATION
Kermit Wolpin, New York, N.Y., assignor to Hit Sales Corporation, New York, N.Y., a corporation of New York
Filed Mar. 17, 1964, Ser. No. 352,470
3 Claims. (Cl. 40—107)

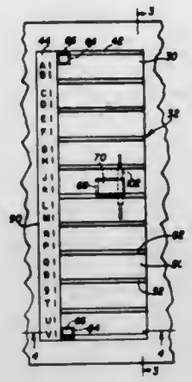
3. An advertising premium calendar structure permitting different advertising or promtional indicia to be associated therewith, said structure comprising: a baseboard of sheet material, said baseboard having a circular recess therein positioned at a point of desired indicia location; a circular matrix dimensioned to fit within the recess, said matrix having a smooth continuous rim providing a desired smooth regular circular contour about its upper face, said upper face bearing the desired indicia, and lying in a plane substantially coplanar with the surface of said baseboard, a lower face on the obverse side of said matrix formed with a plurality of radially extending striations increasing the surface area thereof, and providing adhesive flow channels serving to direct a drop of fluid adhesive positioned at the center of the matrix to the rim thereof; an indexing indent formed at the edge of the lower face of said matrix, and hidden from view by the upper indicia bearing face of the matrix; and a backing board secured to said baseboard and forming the rear surface of said recess to which said matrix is secured, whereby desired indicia may be separately formed on the matrix which is subsequently secured to the calendar with defects arising during indicia application not requiring discard of the calendar structure, and permitting the use of a variety of different indicia on a standard calendar structure.

3,274,717
AUTOMATIC CALENDAR
Charles H. Herr, St. Louis, Mo., assignor of one-half to L. W. Matheny, Brentwood, Mo.
Filed Apr. 16, 1964, Ser. No. 360,199
10 Claims. (Cl. 40—111)

1. A continuous calendar comprising a first motor adapted to be actuated by an electrical impulse, a first drum rotated by the output shaft of the first motor, said drum having indicia designating the days of the week on the outer surface thereof, a second motor means for supplying an electrical impulse to actuate said second motor in response to rotation of the output shaft of the first motor, two independent rotatable drums movable in response to the rotation of the output shaft of the second motor, said drums having numbered indicia indicating the date of the day of the month on the outer surface thereof, the rightmost drum being numbered from 1 to 0 and the leftmost drum having the numerals—to 3, means for rotating the rightmost drum one digit for each impulse received by the second motor except for the 31st impulse in each 31 impulse sequence, means for rotating the leftmost drum one digit when the rightmost drum moves from 9 to 0 and on the 31st impulse received by the second motor in each 31 impulse sequence, a third motor, a third drum having indicia indicating the month of the year on the outer surface thereof, said drum being movable when the third motor is actuated, means for supplying an electrical impulse to energize the third motor once during each 31 impulse sequence received by the second motor, and means for providing 31 impulses to the second motor for each impulse supplied to the third motor, said means including a plurality of cams controlling switches which energize the second motor one, two, or three extra times on the last day of a 30, 29 or 28 day month, respectively.

3,274,718
INFORMATION DISPLAY PANEL
Ralph G. Panochyk, Grand Rapids, Mich., assignor to Automatic Canteen Company of America, Chicago, Ill., a corporation of Delaware
Filed Dec. 28, 1964, Ser. No. 421,518
5 Claims. (Cl. 40—124)

1. Indicia structure for an automatic phonograph comprising:



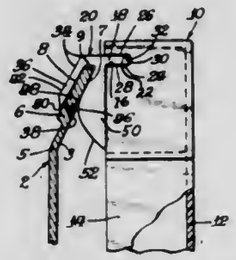
(a) a mounting surface,

(b) an indicia panel pivotally mounted on said surface,

(c) means pivoting said panel on said surface adjacent one end of said panel,

(d) a plurality of parallel grooves in said panel,

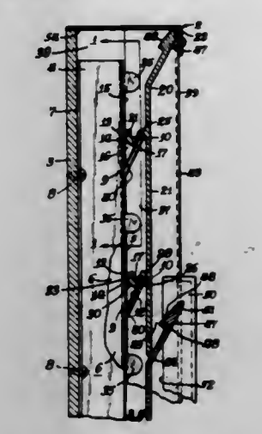
(1) said grooves open at the end of the panel remote from said pivotal mounting,



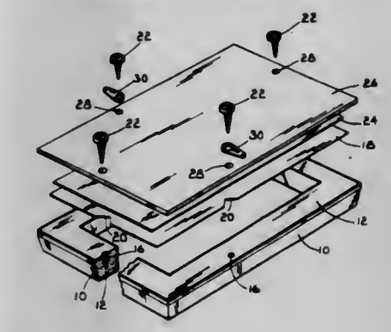
(e) a flap member extending beyond the pivoting means at said one panel end,

(1) said flap member angled with respect to said surface when said panel remote end is resting against said frame, and

(f) means responsive to depression of said flap member for releasing said remote end for movement to a position angled from said surface wherein said grooves are angled from said surface.



3,274,719
SIGN HANGING STRUCTURE
Wilfried Schubert, Northlake, Ill., assignor to Wagner Sign Service, Inc., Chicago, Ill., a corporation of Illinois
Filed Mar. 30, 1965, Ser. No. 443,793
14 Claims. (Cl. 40—142)

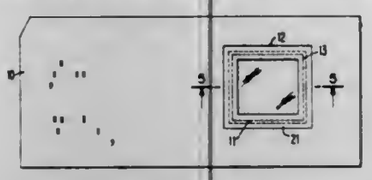


1. A sign structure, comprising: means providing a background panel having upwardly extending elongated rigid camming support surfaces, at least one sign indicia, and means for hanging said indicia on said panel having downwardly extending semi-rigid jaw means, spaced jaw surfaces being outwardly of the sign indicia and effective to be yieldingly cammed apart by said panel camming surfaces for removably providing a connection therebetween, at least one of said camming surfaces having portions disposed at different angles to the opposing surface of the jaw means and being widely spaced at the open end of the jaw means.

3,274,720
DISPLAY SIGN STRUCTURE
Wilfried Schubert, Northlake, Ill., assignor to Wagner Sign Service, Inc., Chicago, Ill., a corporation of Illinois
Filed Sept. 8, 1964, Ser. No. 394,760
10 Claims. (Cl. 40—143)

1. A display sign structure comprising a plurality of uprights each having a pair of vertically spaced locking lugs projecting outwardly therefrom and defining an angular space therebetween, background panel elements adapted for vertical mounting on said uprights and each having wedge locking means, said elements each having a rear surface on which is mounted a generally V shaped rib having diverging side portions, the lower of the lugs of said pair developing a generally V shaped slot with the plane of the front wall of the upright and providing a downwardly and inwardly sloping wedge surface engageable with a complementary surface on one of said rib side portions, said lower lug being adapted to be sprung forwardly from the front wall of the upright to permit entry of the upper edge of said other side portion of the V shaped rib under the lower edge of the upper lug, and said panel elements having upper sign indicia mounting means.

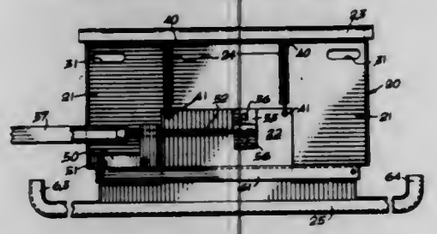
3,274,721
PICTURE FRAMING
Alwyn J. Dreyer, Lynwill Estate, Boskop, Roodepoort, Republic of South Africa
Filed Mar. 30, 1964, Ser. No. 355,718
2 Claims. (Cl. 40—152)



1. A picture frame assembly including a frame, a backing member and a transparent sheet larger than the frame aperture and having notches in its periphery, between which sheet and backing member a picture is adapted to be located, and fastener elements extending through the backing member and the notch spaces in the sheet into the frame to clamp the sheet between the backing member and the back of the frame.

3,274,722
FILM RECORD CARDS AND METHOD FOR MAKING SAME
Ernest P. Kollar, Vestal, and Lewis G. Taft, Endwell, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 10, 1963, Ser. No. 329,413
3 Claims. (Cl. 40—158)

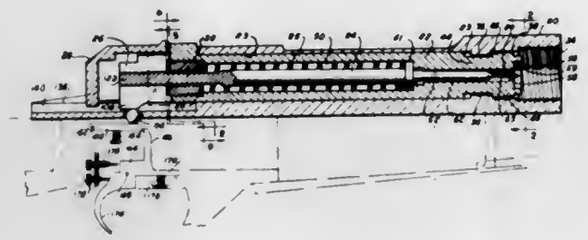
1. A film record card for use in card record systems comprising:



a card having an aperture therein with the edge portions of the card surrounding the aperture being shouldered;

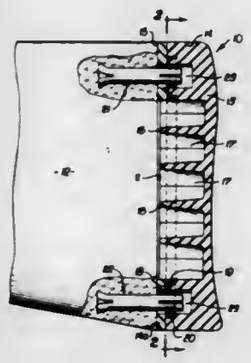
a film insert positioned within said aperture and having a thickness which is less than the thickness of said card, said insert being substantially of the same shape as the shape of the aperture and being smaller in size than the size of the aperture so as to leave a space between the peripheral edge of said insert and the peripheral edge of the card aperture; and

a molded closed-loop frame of polymer material having a T-shaped cross-section for securing said insert to said card, said frame of polymer adhesively contacting the shouldered portions of the card, the marginal edge portions of one face of said insert and the peripheral edges of both said insert and card aperture with said polymer frame lying between the opposite faces of the card and the other face of said insert lying substantially in the plane of the adjacent face of the card.



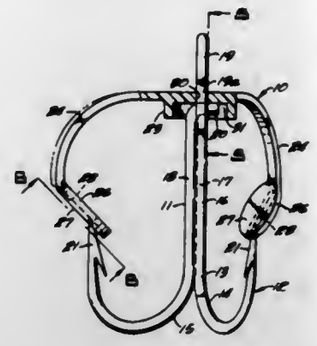
3,274,723
LICENSE PLATE HOLDER
Arthur Jacobs, 3575 SW. 23rd St., Miami, Fla.
Filed Jan. 28, 1964, Ser. No. 340,617
5 Claims. (Cl. 40—209)

3. A license plate frame and holder therefor adapted to be mounted in the recess of a recessed automotive bumper, hinged means for mounting said holder and license plate frame in said bumper recess, said holder having an upper clamping portion adapted to engage the upper edge of said frame and a lower clamping portion adapted to engage the lower edge of said frame, said upper and lower clamping portions being adapted to slidably move toward and away from each other, tension spring means arranged to normally urge said upper and lower clamping portions together, a two part locking device, one part fixed to the lower clamping portion and the other part fixed to the upper clamping portion of the holder, an elongated bolt adapted to operatively engage and connect both parts of said locking device in a manner to prevent relative movement between the upper said lower clamping portions, the mounting means including a back mounting plate adapted to be bolted to the recessed portion of the automobile bumper, a hinge fixed along the upper edge of said back mounting plate and along the upper edge of the holder in a manner to hingedly connect the holder to the bumper and permit it to be swung outwardly from said recessed portion of the bumper.



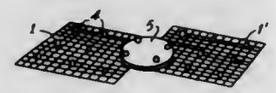
3,274,724
RIFLE BOLT MECHANISM
John H. Brandt, Irving, Tex.
(2120 Irving Blvd., Dallas, Tex. 75207)
Filed June 1, 1965, Ser. No. 459,990
9 Claims. (Cl. 42—16)

1. A rifle bolt mechanism comprising:
(a) a receiver member having a bolt channel therein adapted for being secured at the front end thereof to a barrel member and defining first locking lug means adjacent said front end,
(b) a bolt member rotatably and slidably mounted in said bolt channel defining second locking lug means adjacent the front end thereof for engaging said first locking lug means in locking relation therewith when said bolt is rotated to its firing position,
(c) said bolt member defining a pair of diametrically opposed cam surfaces in the rear wall thereof,
(d) a firing pin asembly mounted within said bolt member and extending from said rear wall thereof,



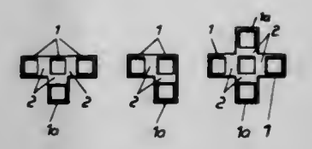
(e) a cocking piece adapted to engage a trigger mechanism securely attached to said firing pin assembly extending from said rear wall of said bolt member and defining a pair of diametrically opposed cams for engaging said pair of cam surfaces, respectively, for withdrawing said firing pin assembly and cocking piece to a cocked position relative to said bolt when said bolt is rotated from said firing position to an unlocked position, and
(f) a non-rotatable bolt sleeve member disposed about said cocking piece to prevent rotation of said cocking piece when said bolt is rotated.

3,274,725
DETACHABLE FIREARM RECOIL PADS
Frank A. Pachmayr, 1220 S. Grand Ave.,
Los Angeles, Calif. 90015
Filed Aug. 2, 1965, Ser. No. 476,590
12 Claims. (Cl. 42—74)



1. The combination comprising a gunstock having an end face, a recoil pad applied thereto including a rubber body peripherally conformed to said face and a metallic reinforcement member bonded to said body, and means for releasably attaching the pad to said face, said means including a pair of fasteners anchored within openings in said stock and having heads projecting from said face into a pair of openings in said reinforcement member and having holding engagement therewith, at least one of said heads being radially resiliently deflectable, said member being releasable from the fastener heads remaining anchored to the gun stock.

3,274,726
WEED GUARD FOR TREBLE HOOK
John Oney, 5872 Woodward Drive, Akron, Ohio
Filed Nov. 6, 1964, Ser. No. 409,492
7 Claims. (Cl. 43—43.4)



1. A weed guard for a treble hook having a shank terminating in an eye and provided with a transverse locking portion inwardly closely adjacent the eye, comprising: a hub having a central axis; said hub having axially opposite, outer and inner sides, and being of relatively hard but somewhat resilient synthetic resin plastic; said hub having a diametrically elongated slot extending axially therethrough and a groove of less depth than the thickness of the hub in said inner side of same and cross-wise of the slot to communicate therewith at the central portion of the hub; whereby the eye of the hook is yieldingly forcibly insertible axially through the slot to project outwardly of said outer side and engage said locking portion in said groove, thereby to prevent relative rotation of the hub with respect to the shank and whereby a widening portion of the eye overhangs and engages the ends of the slot to prevent axial retraction of the eye from the hub; said hub having integral, resiliently flexible, radial arms having terminal portions for yielding engagement with the hook points inwardly thereof; said flexible arms having outwardly arched portions intermediate said terminal portions and the hub to overhang the hook points, for deflecting weeds away from the points.

3,274,727
MOSAIC PLUG-IN TOY
Werner Zander, 20 Frobelstr., Zirndorf (Nbg. 2), Germany
Filed June 28, 1962, Ser. No. 206,083
Claims priority, application Germany, Aug. 26, 1961, Z 8,931; Sept. 9, 1961, Z 8,962; Oct. 10, 1961, Z 9,011
9 Claims. (Cl. 46—16)

1. A mosaic plug-in toy comprising grid-shaped base plates, each base plate being formed by a plurality of grid bars intersecting at right angles to each other so as to define rectangular grid openings therebetween, said base plate having a plurality of studs of specific length integral with and extending from said grid bars at one side of said base plate substantially at right angles to a plane passing through said grid bars; at least one substantially flat junction plate having a plurality of perforations and a thickness less than the specific length of said studs, the studs of a plurality of adjacent base plates being insertable in the perforations of said junction plate so that said studs protrude through said perforations and said junction plate being adapted to overlap said adjacent base plates and to be frictionally secured by said studs, said studs being adapted to support said base plate on a substantially horizontal supporting surface so that said junction plate and said grid bars are spaced from the supporting surface whereby the fingertips of a user are insertable in the space between the supporting surface on the one hand and said junction plate and said grid bars on the other hand for raising said junction plate and base plate from the supporting surface; and a multiplicity of mosaic element plates having a rear side and plug means extending only from said rear side thereof at substantially right angles thereto, said plug means defining a multicornered figure in cross section having effective cross-sectional dimensions corresponding to those of at least one of the rectangular grid openings of said base plate and being insertable in said rectangular grid openings so that it is frictionally engaged and positively held therein against rotation, said element plates having spacer means and at least one lateral surface portion at said rear side thereof, said spacer means extending from said lateral surface portion a distance less than the specific length of said plug means so that said spacer means is in abutting engagement with the grid bars of said base plate and said lateral surface portion is substantially parallel to the plane passing through said grid bars when said plug means is fully inserted in said grid opening whereby said lateral surface portion of said element plates is engageable by the fingertips of a user for removing said element plates from said base plate.

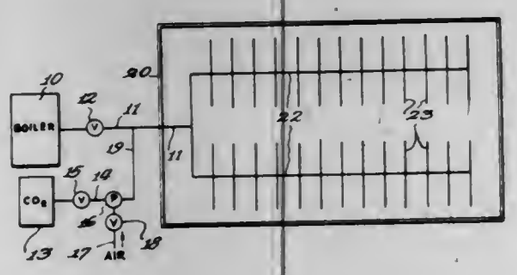
3,274,728
CONSTRUCTION TOY
Fritz Koch, 16 Plantagenstr., Berlin-Steglitz, Germany
Filed May 28, 1963, Ser. No. 284,294
Claims priority, application Germany, Feb. 16, 1959, K 36,974
3 Claims. (Cl. 46—29)

1. A construction toy comprising, in combination, at least a connector element and a plurality of rod elements adapted to be connected to one another by said connector element, said connector element having a central sleeve of rectangular cross section and two adjacent sleeves of rectangular cross section spaced from said central sleeve and from one another and a pair of substantially rectangular plate-like links interconnecting said adjacent sleeves with said central sleeve at one end portion of said sleeves, said plate-like links each connected along one edge to one side of said adjacent sleeves and connected along the edge opposite to said one edge to sides of said central sleeve respectively that are disposed perpendicularly to one another, said sleeves being formed with passages whose axes are substantially parallel to one another, said rod elements being received in said passages in friction-fit engagement with said sleeves, said plate-like links being disposed in a plane substantially perpendicular to the axes of said passages and being flexible about an axis lying substantially in said plane, whereby said rod elements may be disposed in selected angular positions with respect to each other by flexing said plate-like links.

3,274,729
DOLL HAVING PHOTOCELL-ACTUATED SOUNDING MEANS

Claude Refabert, Paris, France, assignor to Etablissements Clodrey Polyflex, Paris, France, a society of France

Filed June 17, 1964, Ser. No. 375,833
Claims priority, application France, Dec. 23, 1963, 958,250
11 Claims. (Cl. 46—232)



1. A toy comprising, in combination, a doll body, a photoelectric cell carried by the toy in such a position on said doll body normally covered by the clothes of said doll that it can be irradiated by light striking said toy, an electric transducer carried by said toy on the inside thereof, means carried by said toy and operatively connected with said cell for energizing said transducer in response to a given irradiation of said cell by light, and means operative by said transducer for producing a signal when said transducer is operating.

3,274,730
UNDERGROUND GAS DIFFUSION SYSTEM

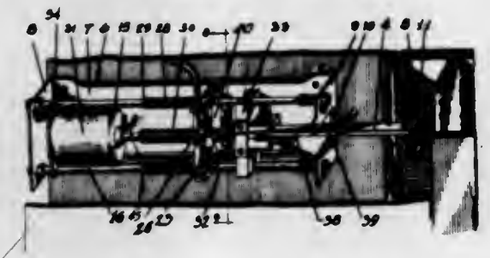
Robert N. Bose, St. Joseph, Mich., assignor to Whirlpool Corporation, a corporation of Delaware

Filed May 8, 1964, Ser. No. 365,985
6 Claims. (Cl. 47—1)

6. A device for sterilizing soil containing moisture and for supplying carbon dioxide to plants growing in said soil and having below the soil and above the soil portions, comprising: a source of steam; gas permeable conduit means positioned in said soil; means for directing steam from said source into said conduit means for sterilizing contact with said soil; means enclosing said soil and said plants; a gaseous carbon dioxide supply means; an air supply means; means for mixing carbon dioxide and air from the respective supply means to form a mixture; and means for flowing said mixture from said supply means, through said conduit means and into said soil for contact with said below soil portions, for solution in said moisture, and for upward diffusion contact with said above soil portions, said enclosing means serving to maintain said carbon dioxide in contact with said above soil portions.

3,274,731
METHOD OF MULCHING

Richard E. Vigneault, Raleigh, N.C., and Kenneth C. Finster and John V. Landry, Lake Jackson, Tex., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware



No Drawing. Filed Feb. 14, 1964, Ser. No. 344,831
5 Claims. (Cl. 47—9)

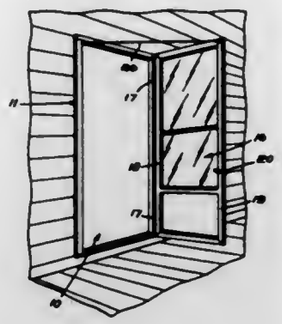
5. An agricultural method which comprises placing and maintaining around a plant, during the growing season, a mulch comprising a polymeric material consisting essentially of a solid, degradable copolymer of ethylene and an ethylenically unsaturated carboxylic acid, said acid being present in the copolymer in an amount from about 2 percent to about 20 percent by weight based on the weight of the copolymer, and subsequently disposed of said mulch by tilling it into the ground.

3,274,732
CAR DOOR ACTUATOR DEVICE

Paul Murakami, 10206 Armand Lavergne, Montreal, Quebec, Canada

Filed Aug. 24, 1964, Ser. No. 391,452
2 Claims. (Cl. 49—280)

1. An actuator for operating a vehicle's door having a door latch mechanism, particularly a thick hollow door having an inner wall and an outer wall and hingedly secured to an adjacent part of said vehicle for rotation relatively thereto about a hinge axis located near one edge of said door and close to the outer wall thereof, said actuator being located between the walls and comprising a straight track at right angle to the hinge axis and secured to one of said walls, a nut block slidably mounted on said track; a reversible electric motor slidably mounted on said track and having a long screw threaded shaft parallel to said track and projecting through a correspondingly threaded hole across said nut block; a bearing block slidably mounted on said track; said shaft terminating into said bearing block for simultaneous axial displacement therewith and free rotation therein; a connector rod secured at one end to said bearing block and freely rotatable about an axis essentially parallel to the hinge axis and similarly at the other end thereof to an adjacent part of said vehicle at a point thereof which is inwardly offset from the hinge axis of the door; cooperating means on said nut block and track to limit the displacement of said nut block on said track; spring means urging said nut block in the direction of said bearing block, and a cable connected to the said nut block and to the door latch mechanism; any displacement of said nut block against the action of said spring means being transmitted by said cable to the latch mechanism so as to cause unlatching of said door.



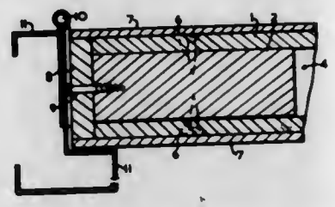
3,274,733
METAL STORM DOOR AND STOP THEREFOR

David N. Bailey, 95 Grove St., South Braintree, Mass.

Filed Feb. 19, 1964, Ser. No. 345,981
3 Claims. (Cl. 49—387)

1. In combination, a door frame, and a metal storm door hingedly mounted within said frame of the type having hollow top, hinge and latch sides, and with said latch side being blocked by a latch, a

weight vertically slidable in one of said sides, said door having an opening in the form of an anti-friction grommet adjacent the upper corner of the latch side thereof, a flexible member extending through said opening and connected to said weight, the free end of the flexible member being attached to the top of the frame for the door

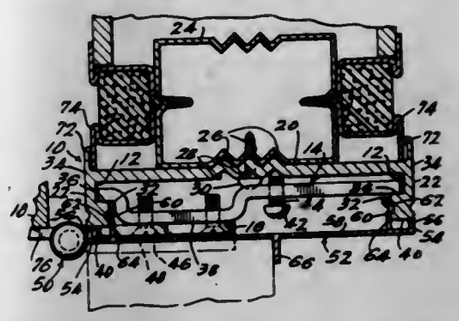


adjacent the latch side of the door when the door is closed, and a resilient bumper secured within said one side adjacent the upper end thereof and engageable by said weight for resiliently limiting movement of said door as it approaches its wide-open position, said position being determined by the length of said flexible member within said door when said door is in its closed position.

3,274,734
FIRE RESISTANT DOOR

Harold Geoffrey Davis, Sydney, New South Wales, Australia, assignor to Padde Pty. Limited, New South Wales, Australia, a company of New South Wales, Australia

Filed Sept. 21, 1964, Ser. No. 397,728
2 Claims. (Cl. 49—503)

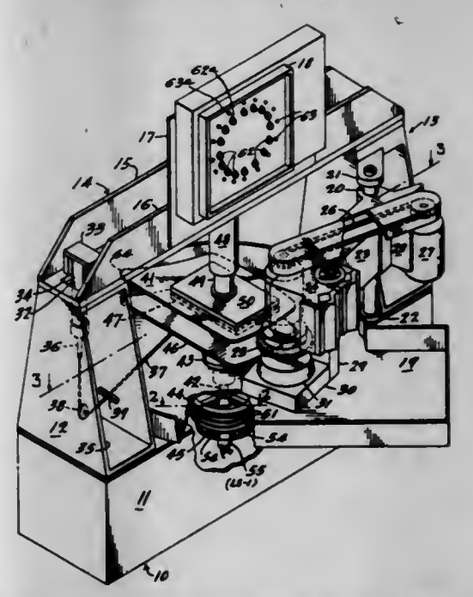


1. A fire resistant door comprising two panels of high density fire resistant material having high thermal insulation and low coefficient of expansion, said panels being fixed to opposite sides of a frame of high density fire resistant material also having high thermal insulation and low coefficient of expansion and providing a space between the panels, said frame comprising stiles flush with the vertical edges of the panels and a head rail located between the stiles and the top edge of the panels and flush therewith, said stiles being covered on their exposed edges by decorative sheets, said space being filled with fire resistant material of low density, said low density fire resistant material comprising blocks laid horizontally in the space between the panels, the lowermost block being flush with the bottom edge of the panels and stiles, decorative sheets covering the exposed faces of said panels, said sheets being made of timber and impregnated with a fire retardant material, the stile at one vertical edge of the door formed of higher density material than the remainder of the frame, door hinges secured to said last mentioned stile, door locking means mounted in the door medially and adjacent the other vertical edge thereof, said higher density stile formed of a densely bonded calcium silicate composition, the remainder of the frame and the panels formed of a less densely bonded asbestos composition, and said blocks are formed of a still less densely bonded calcium silicate composition.

3,274,735
JAMB AND DOOR HINGE SUPPORT

David W. Stackhouse, Bronson, Mich., assignor to The L. A. Darling Company, Bronson, Mich., a corporation of Delaware

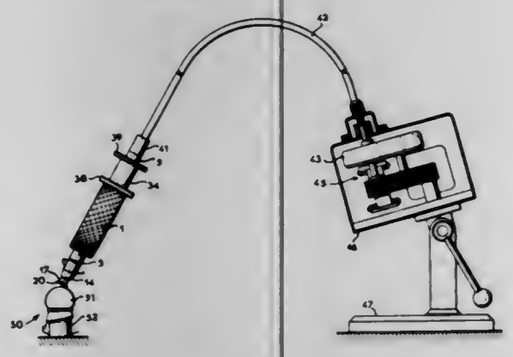
Filed Dec. 10, 1964, Ser. No. 417,412
4 Claims. (Cl. 49—504)



1. A doorjamb assembly comprising: an upright generally U-shaped channel member having a web and a pair of laterally extending flanges respective ones of which are located at opposite ends of said web, said flanges having inner sides which face each other and outer sides which face away from each other, each of said inner sides forming a first recess adjacent said web with a shoulder facing said web, a hinge support plate opposite ends of which are seated in said first recesses, said hinge support plate having a section intermediate said ends which is flush with the lateral outer ends of said flanges when said ends are seated against said shoulders, a hinge having two hinge plates, means fastening one of said hinge plates to said intermediate section of said hinge support plate, at least one jamb screw for forcing said hinge support plate laterally outwardly from said web against said shoulders of said flanges, a generally U-shaped facia strip overlying said channel member laterally outwardly of said hinge plate, and means securing said facia strip to said channel member.

3,274,736
EDGE TOOLING APPARATUS

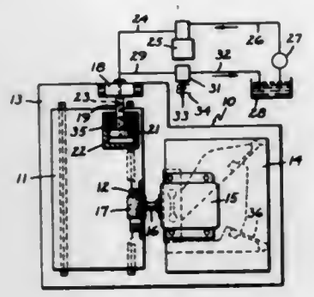
Roscoe Theron Brokaw, Ann Arbor, Mich., assignor to The Sun Tool & Machine Co., Toledo, Ohio, a corporation of Ohio



Filed Mar. 20, 1964, Ser. No. 353,404
7 Claims. (Cl. 51—105)

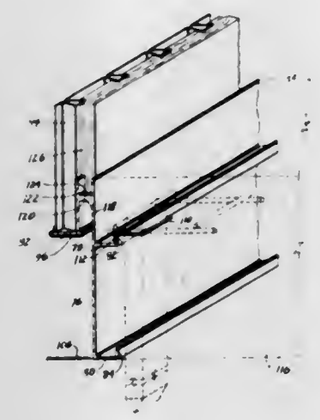
1. In a machine for edge tooling a generally planar workpiece which is unsymmetrical about an axis of rotation normal to the plane of such workpiece, a speed control device comprising, in combination, means for rotat-

ing such workpiece on such axis, switching means, a plurality of variable speed control means responsive to said switching means and means for actuating said switching means at predetermined angular increments of each revolution of such workpiece, whereby the angular speed of such workpiece is separately controlled as it passes through consecutive angular increments.



3,274,737
POLISHING OF CORNEAL LENSES
Pierre Michel Rocher and Claude Gabriel Thomas, Saint-Maur, France, assignors to Lentilles Ophtalmiques Rationnelles, Saint-Maur, France, a corporation of France
Filed Sept. 12, 1963, Ser. No. 308,580
Claims priority, application France, Oct. 6, 1962, 911,505
2 Claims. (Cl. 51—131)

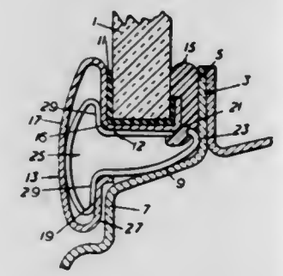
1. Polishing apparatus for polishing the rim of corneal lenses, comprising, in combination, a rotary polisher and a hand tool for holding the lens to be polished and rotating it around its axis, said polisher comprising a head made of a resilient material, a rotary shaft on which is mounted said head, while said hand tool comprises a handle having an axial bore, a support spindle carried in bearings fitted in said axial bore of the handle, which bearings are adapted to prevent axial displacement of the spindle, a gripping device for holding the lens to be polished mounted at one end of the spindle, said gripping device being a suction cup made of a resilient material, the bottom of said cup being in communication with an internal axial bore in the support spindle, a piston sliding in said internal bore for moving towards and away from the cup, a rod disposed along the axis of said internal axial bore and fixed to said piston, an actuating sleeve surrounding the spindle and solid with the rod, a screw passing through an elongated opening formed lengthwise in the wall of the spindle and connecting the rod to the sleeve, a return spring disposed in the internal axial bore and surrounding said rod so as to tend to move said piston away from said cup, said apparatus further comprising driving means for the spindle, said driving means comprising a driving motor having an output shaft, a reduction gear connected to said output shaft, a flexible drive connecting said reduction gear to the end of the support spindle opposite to the cup.



3,274,738
GRINDING MACHINE
Martin L. Kunlholm, Worcester, Mass., assignor to The Heald Machine Company, Worcester, Mass., a corporation of Delaware
Filed Feb. 13, 1964, Ser. No. 344,653
6 Claims. (Cl. 51—165)

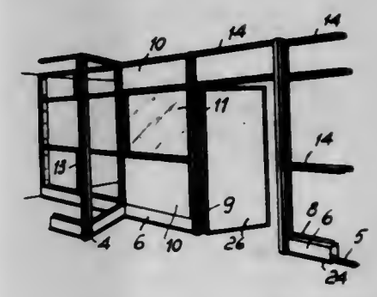
1. An internal grinding machine, comprising
(a) a base,
(b) a workpiece support adapted to hold a workpiece, the said support being mounted on the base for transverse sliding motion thereover,
(c) a wheelhead adapted to carry an abrasive wheel pivotally mounted on the base.
(d) a hydraulic linear actuator for bringing about the sliding motion between the support and the base to bring about engagement between the wheel and the workpiece,

(e) a strain gage means associated with the wheelhead for indicating the force between the wheel and the workpiece, and
(f) a control including an electrohydraulic servo valve responsive to a signal from the strain gage means for regulating the feed means to maintain the force between the wheel and the workpiece at a predetermined constant value.



3,274,739
SHEET PANEL ASSEMBLY AND SUPPORTING MEMBERS THEREFOR
Resta S. Gregoire, Washington, D.C., assignor to Gregoire Engineering and Development Company, Adelphi, Md., a corporation of Maryland
Filed June 7, 1962, Ser. No. 200,682
8 Claims. (Cl. 52—169)

1. A sheet panel wall assembly comprising
a plurality of sheet panels, each panel having edge formations at opposite side edges of the panel,
said edge formations being complementary in the formation of an interlocking joint of substantially triangular-ridge outer form between adjacent panels in the assembly, said outer form being that of the edge formation of one of said adjacent panels and having an open apex at the terminal edge of said formation, the other of the adjacent panels having a tongue formation extending through said apex into locking engagement therein,
each panel having at least one substantially triangular ridge fold in it at intervals between said opposite side edges, the folds of the panel sheet at the base

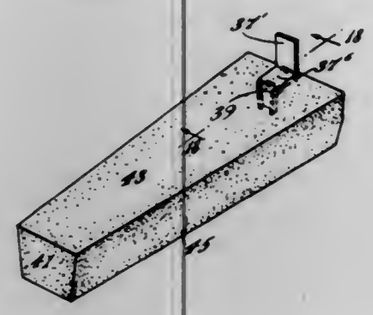


of each ridge being only slightly spaced sufficiently to provide for expansion and contraction of the panel under normal temperature changes without causing the flat panel portions between ridges and between the side edges and adjacent ridges to buckle,
said intermediate ridges and said edge formation ridges extending to the same side of the panels in said assembly presenting a substantially continuous flat surface on the other side of the assembly,
said plurality of panels forming a wall having self supporting vertical rigidity in the direction of said ridges,
a footing extrusion member having a vertical guide web portion extending downwardly with a horizontal ledge extending outwardly at the bottom thereof supporting the bottom edge of said wall,
retaining clip means holding said wall on said ledge and biased against said vertical guide web so as to impart the strength and form of said extrusion member to the rigidity of the panel wall at its lower edge,
an eave support extrusion member having a vertical guide web portion extending upwardly with a horizontal ledge extending outwardly at the top thereof and supported on the upper edge of said wall, and
retaining clip means holding said upper edge under said ledge at the top of said vertical guide web portion and biased against said vertical guide web, so as to impart the strength and form of said eave support extrusion member to the rigidity of the panel wall at its upper edge,
whereby a lightweight, strong and easily assembled wall may be built without the use of any tools or additional framework or attachments, such as screws, rivets, nails or bolts.

3,274,740
MOTOR VEHICLE WINDOW
Leslie Hall, Northfield, Birmingham, England, assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed June 3, 1964, Ser. No. 372,279
8 Claims. (Cl. 52—208)

1. A motor vehicle window assembly comprising a glass panel;
a window frame defining a glass panel receiving aperture,
said frame including a shoulder vertically spaced from an edge of said panel,
said shoulder terminating in a flange in parallel spaced relationship to a marginal area of one face of said panel;
adhesive means interposed between said marginal area and said flange bonding said panel to said window frame;
at least one spring clip interposed between said panel edge and said shoulder,
said spring clip having at least one resilient leg portion in engagement with said frame shoulder;
a decorative moulding,
and coacting means on said spring clip and said decorative moulding retaining the latter in spring clip concealment position against the other face of said panel.

3,274,741
ASSEMBLABLE AND DISASSEMBLABLE PARTITION
Richard Neagle, Milan, Italy, assignor, by mesne assignments, to Edison, Milan, Italy, a corporation of Italy
Filed May 7, 1962, Ser. No. 192,865
Claims priority, application Italy, May 9, 1961, 8,577/61
5 Claims. (Cl. 52—242)

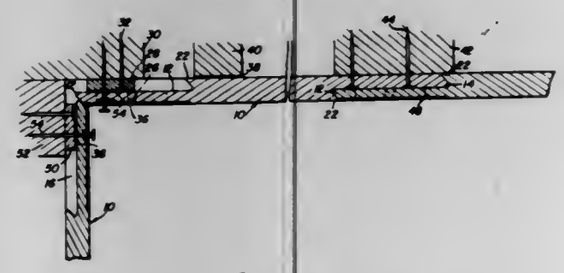


2. A readily assemblable and disassemblable partition comprising:
at least two spaced tubular plug-like outwardly extending synthetic-resin anchoring elements adapted to be secured to a supporting surface;
respective tubular prismatic uprights of synthetic-resin material having socket portions of a configuration corresponding to that of each of said elements and fitting removably thereover while being resiliently held thereon under the elasticity of said material, said uprights each having a pair of respective flanges extending longitudinally therealong on opposite faces of the upright adjacent diagonally opposite corners thereof, at least a first one of said flanges on each of said uprights extending in the direction of the other of said uprights;
a pair of plug-like tubular connecting members of synthetic-resin material, each mounted upon one of said uprights and extending in the direction of the other upright;
a longitudinally extending tubular stringer of synthetic-resin material bridging said uprights and having socket-forming extremities of a configuration conforming to that of said connecting members and removably fitting thereover while being resiliently held thereon under the elasticity of said material; and
a panel of synethic-resin material abutting said stringer and said first flanges of said uprights, said uprights having confronting faces resiliently sandwiching said panel between them, said partition further comprising a T-shaped member intermediate said upright having a vertically extending web portion, and a hollow socle member of synthetic-resin material provided with a groove releasably receiving said web with resilient engagement thereof, said panel abuttingly engaging said socle member and being disposed between the latter and said stringer, said socle member being provided with a pair of longitudinally extending ribs adapted to rest against said supporting surface laterally outwardly of said T-shaped member and a pair of downwardly and outwardly extending longitudinal wing-like projections adjacent said supporting surface, said partition being provided with respective cover members having a pair of flanges forming an acute angle disposed between the respective wing-like projection and said supporting surface with one of the flanges of each of the cover members overlying the respective projection and the other flange of each cover member underlying the respective projection.

3,274,742
REFRACTORY WALL CONSTRUCTION

Wortley B. Paul, Jr., Berwyn, Pa., and George C. Mayhew, Dearborn, Mich., assignors to General Refractories Company, Philadelphia, Pa., a corporation of Pennsylvania

Filed Feb. 7, 1963, Ser. No. 256,922
3 Claims. (Cl. 52—245)

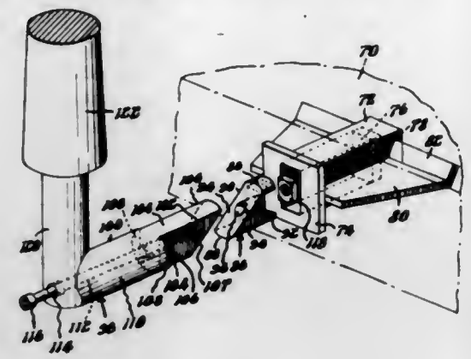


1. An inclined conical refractory wall comprising burned refractory bricks laid in conical course, each brick having a hot end and a cold end with sides extending longitudinally between the ends, the hot end forming an inner inclined conical wall surface with a cold end being substantially parallel thereto, said wall including a lower course of bricks and an upper course of bricks resting directly on the lower course of bricks, each brick of an upper course having an aperture in the lower side of the brick and a metallic projection, the projection including a tab extending downwardly from the cold end of the brick perpendicular to the lower side of the brick adapted to engage against the cold end of a brick of a lower course, a web extending inwardly therefrom along a recess in the lower side of the brick toward the hot end and a leg extending upwardly from the web parallel to the tab and resiliently wedged into the aperture in the lower side of the brick.

3,274,743
INTERLOCKING WALLBOARD

Joseph Louis Blum, Jr., 109 E. Henfer Park, New Orleans 23, La.

Filed July 10, 1963, Ser. No. 294,067
7 Claims. (Cl. 52—284)

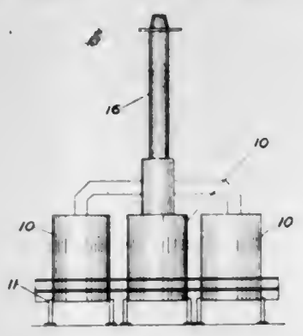


1. A prefabricated wallboard panel comprising an elongated planar member having a beveled marginal edge portion, an elongated recess adjacent said marginal edge portion defining a face and a chamfered portion, a depression formed in said wallboard adjacent said marginal edge portion in the face thereof remote from the recess, a plurality of preformed filler material receiving and bonding apertures in said depression through said planar member, said planar member being adapted to have said marginal edge portion thereof disposed in overlapped engagement with a marginal edge portion of a second planar member also having an elongated recess formed therein but opening in the opposite direction relative to the first mentioned recess.

3,274,744
MOUNTING FOR HANDRAILING

Louis Blum and William J. Horgan, Jr., Pittsburgh, Pa., assignors to Blumcraft of Pittsburgh, Pittsburgh, Pa.

Filed Dec. 13, 1963, Ser. No. 330,388
6 Claims. (Cl. 52—704)

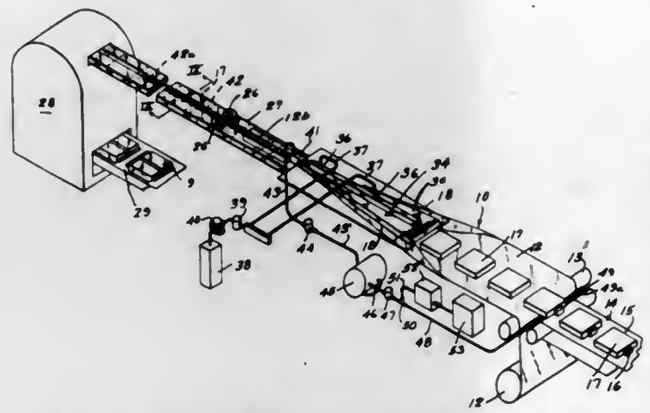


1. In apparatus for securing the posts of handrailings to masonry stair treads, the combination comprising a tubular sleeve adapted for being embedded in and thereby anchored to a masonry stair tread, and a wedge assembly including inner and outer coacting wedges nonturnably fitted into and selectively positioned longitudinally of said sleeve and provided with abutting surfaces inclined relative to the axis of said sleeve, the outer one of said wedges being provided with a head extending across the outer end of said sleeve and adapted for being interposed between said sleeve and the base of the post, a screw extending through said wedges and drawing said wedges together for being wedged tightly in said sleeve in the selected position thereof, and screws threaded into said head and adapted for extending through the base of said post and holding the same to said head in overlying relation to the outer end of the first mentioned screw.

3,274,745
PROCESS FOR CONSTRUCTING A PETROLEUM REFINERY

Calvin J. McManus, Forest Hills, and Francis J. Upton, Little Neck, N.Y., assignors to Foster Wheeler Corporation, New York, N.Y., a corporation of New York

Filed July 2, 1962, Ser. No. 206,845
2 Claims. (Cl. 52—745)

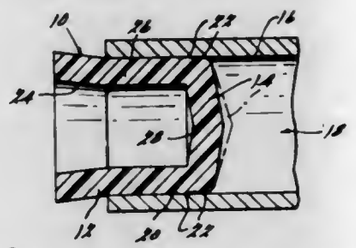


1. A process for constructing a petroleum refinery which has species of equipment elements, pumps and heaters and towers each defining a species, the process comprising the steps of preassembling a plurality of the elements of at least two of the species with each species in at least one separate structural module and with the size and weight of each module determined by handling and shipping limitations, transporting the modules to a desired site, erecting the modules on suitable foundations, operatively interconnecting the equipment elements, structurally integrating the modules.

3,274,746
METHOD OF AND APPARATUS FOR PACKAGING UNITS IN A PRESERVATIVE ATMOSPHERE

Robert C. James, David A. Wilson, and Frank E. Pringle, Jr., Sheboygan, Wis., assignors to Hayssen Manufacturing Company, Sheboygan, Wis., a corporation of Wisconsin

Filed Sept. 9, 1963, Ser. No. 307,406
27 Claims. (Cl. 53—22)

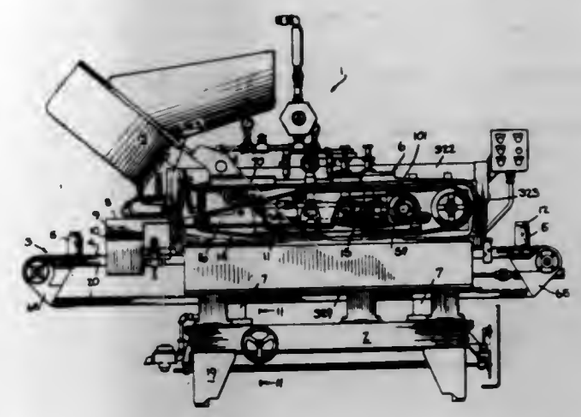


22. In a method of packaging a plurality of spaced units in a forwardly moving elongated tube of gas impervious flexible material adapted to be progressively sealed about said units, the steps of flowing preservative gas in said tube, withdrawing gas from said tube as it is moving forward, and recirculating withdrawn gas over spaced units being moved forwardly into the tube.

3,274,747
METHOD OF SEALING TUBING

John R. Fueslein, Jeddo, and Robert R. Rader, Port Huron, Mich., and Edward C. Roper, Springdale, Conn., assignors to Mueller Brass Co., Port Huron, Mich., a corporation of Michigan

Original application Aug. 14, 1962, Ser. No. 216,841, now Patent No. 3,200,984, dated Aug. 17, 1965. Divided and this application Aug. 14, 1964, Ser. No. 389,597
4 Claims. (Cl. 53—22)

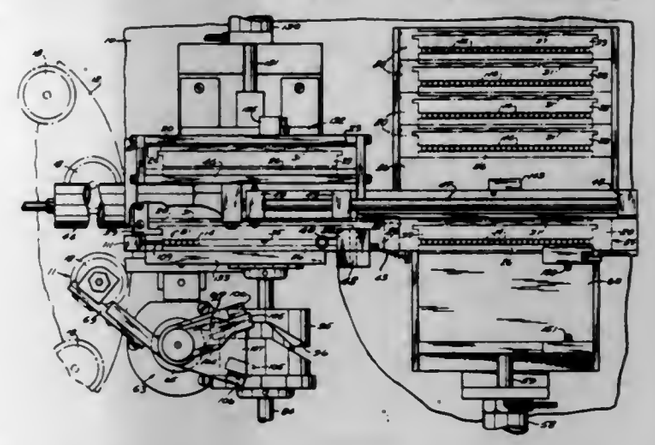


1. A method for maintaining the interior of tubular members devoid of contamination and deposits for prolonged periods of time which comprises the steps of cleaning the interior of the members to remove undersirable deposits from the inner surfaces thereof, purging the interior of the cleaned said members with a substantially moisture-free inert fluid, and thereafter sealing said inert fluid in the interior of said members.

3,274,748
SEALING MACHINE AND METHOD

Cecil P. Roberts and Joseph C. Runco, Lancaster, Ohio, assignors to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware

Filed May 10, 1963, Ser. No. 279,458
25 Claims. (Cl. 53—38)



9. The method of sealing a container with a screw cap which comprises the steps of loosely threading the cap to the top of the containers, and thereafter moving the container to carry an off-center portion of the top of the cap into sliding frictional engagement with a retarding member and an opposite off-center portion into frictional engagement with a moving endless belt, moving said endless belt at a speed greater than the speed of the moving container and in the same direction, and equalizing the downwardly directed forces against the cap top by said retarding member and said belt member by transmitting a generally vertical movement in one to an opposite generally vertical movement of the other member.

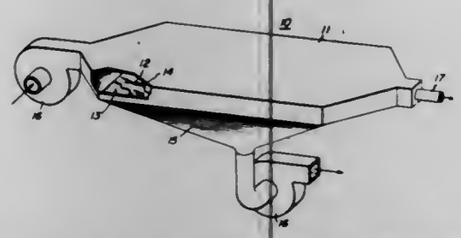
3,274,749
ARTICLE UNLOADING AND TRANSFER APPARATUS

James O. Hinkle, Emmaus, and Peter Toth, Jr., Bethlehem, Pa., assignors to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed May 29, 1963, Ser. No. 284,192
6 Claims. (Cl. 53—251)

1. An unloading and transfer apparatus for unloading articles from holders moved successively into an unloading station and transferring the articles to elongated racks comprising:

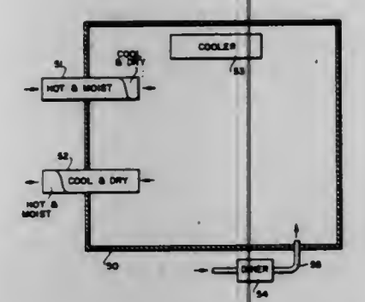
means for advancing elongated racks one by one in a path normal to the length of the rack to a rack-loading position in which each rack remains stationary until loaded,



transfer means having gripping jaws for successively removing articles from the holders and depositing them at one end of an elongated rack advanced to a loading position,

pusher means adjacent said one end of a rack so advanced and operable after each article is deposited for sliding the deposited articles along the rack towards the opposite end of the rack,

means for detecting when a desired number of articles have been loaded into a rack, and



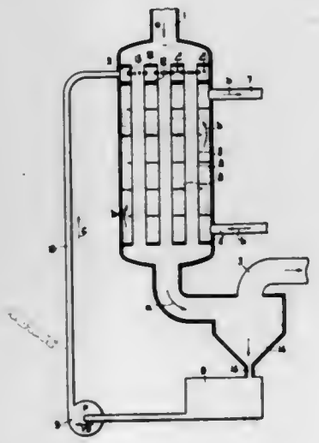
means responsive to said detection for removing the loaded rack from the loading position in a path extending along the length of the rack and for initiating the operation of the advancing means to advance a succeeding rack into the rack-loading position.

3,274,750
PERMEABLE POLYMERIC MEMBRANE GAS SEPARATION
Walter L. Robb, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed Dec. 28, 1962, Ser. No. 247,904
4 Claims. (Cl. 55—16)

2. A method for separating xenon and krypton from a gas mixture consisting essentially of nitrogen, xenon and krypton comprising the steps of: bringing the mixture into contact with one side of a thin, non-porous silicone rubber membrane, causing a portion of the mixture to permeate through said membrane and removing the gas mixture enriched to a substantial degree in xenon and krypton from the opposite side of said membrane.

3,274,751
PROCESSING OF GASES FLOWING INTO AND OUT OF AN ENCLOSED SPACE
Charles W. Skarstrom, Montvale, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Filed May 20, 1963, Ser. No. 281,874
18 Claims. (Cl. 55—33)

13. A method of ventilating a region comprising an enclosed space by transferring gas from said region to a second region of a different moisture content while controlling the transfer of moisture between the two regions which comprises in combination:

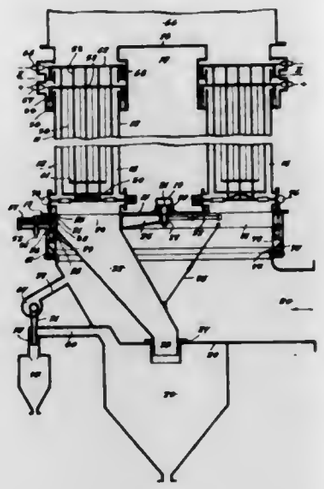


(a) Flowing gas cyclically into said space through a first moisture transfer zone which zone provides a passage between said regions and is characterized by the ability to remove a substantial portion of the moisture content in the gas passing through it per cycle,

(b) Simultaneously flowing gas cyclically outside of said space through a second moisture transfer zone which zone provides a passage between said regions and which zone is characterized by the ability to remove a substantial portion of the moisture contained in the gas passing through it per cycle,

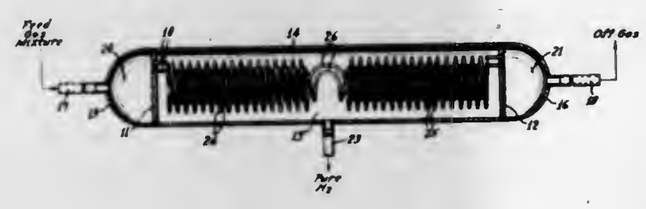
(c) Simultaneously introducing a second stream of relatively dry gas as compared to the gas in said enclosed space into said enclosed space,

(d) Cyclically alternating the direction of flow of gas through said first and second zones, wherein the flow of gas through the zones is such that substantially no breakthrough of the moisture within said zones occurs and wherein flow through a zone into one of said regions is accompanied by flow out of the same region through the other zone.



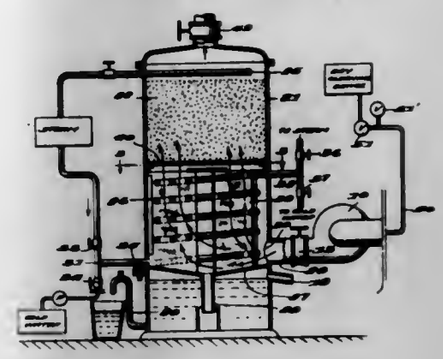
3,274,752
PROCESS AND APPARATUS FOR IMPROVING THE TRANSFER OF HEAT FROM A HOT GASEOUS FLUID
Jean Huyghe and Henri Mondin, Grenoble, France, assignors to Commissariat a l'Energie Atomique, Paris, France
Filed Jan. 28, 1963, Ser. No. 254,142
Claims priority, application France, Feb. 13, 1962, 887,885
8 Claims. (Cl. 55—89)

1. A process for improving the transfer of heat from a hot gaseous fluid flowing through a tubular heat exchanger to a cooling fluid surrounding said tubular heat exchanger, comprising: flowing a stream of said hot gaseous fluid through said tubular heat exchanger; introducing droplets of an auxiliary liquid, which will not vaporize at the temperature of said hot gaseous fluid, into said stream of hot gaseous fluid adjacent the inlet end of said tubular heat exchanger, said droplets mixing with said stream of hot gaseous fluid and forming a film of said auxiliary liquid on the internal wall of said tubular heat exchanger; circulating said cooling fluid in contact with the external wall of said tubular heat exchanger for cooling said hot gaseous fluid and said film of auxiliary liquid; and separating said gaseous fluid from said auxiliary liquid at the outlet from said tubular heat exchanger.



3,274,753
ELECTROSTATIC PRECIPITATORS
Herbert Brandt, Rothemuhle uber Olpe, Westphalia, Germany
Filed May 28, 1964, Ser. No. 370,969
7 Claims. (Cl. 55—111)

1. In an electrostatic precipitator comprising an assembly of a plurality of vertical chambers disposed adjacent to each other in a circle around a vertical axis, dust-laden gas being caused to flow from a duct through the said chambers, each said chamber being provided with an electrode system to which high-tension electric current is supplied, means for periodically shutting off a said chamber from the flow of said dust-laden gas, the flow of current to the electrode system in the said chamber being cut off or progressively reduced during said shut-off period, means for vibrating the said electrode system during said shut-off period to dislodge dust collected on said system, a dust-collecting hopper disposed below the assembly of chambers, and means for directing said dislodged dust into the dust-collecting hopper, the improvement which comprises a chute disposed below the assembly of chambers, said chute having a lower end extending into the dust collecting hopper in axial alignment with the axis of said assembly of chambers and an upper end

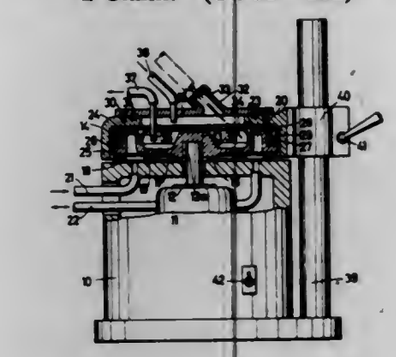


adapted to register with the bottom end of a chamber, means for rotating the chute periodically and stepwise whereby its upper end registers successively with individual chambers, the spacing between the upper end of the chute and the bottom end of a chamber being close without being gas-tight, the top ends of all of the chambers being uncovered, and means for flowing a gas through a shut-off chamber and the chute in register therewith at a velocity of less than fifty percent of the velocity at which the dust-laden gas flows through the chambers.

3,274,754
GAS PURIFICATION APPARATUS
Leonard R. Rubin, Union, N.J., assignor to Engelhard Industries, Inc., Newark, N.J., a corporation of Delaware
Filed Jan. 17, 1964, Ser. No. 338,328
5 Claims. (Cl. 55—158)

1. Apparatus for diffusion purification of a gas comprising a chamber having two end walls and an outlet, and a diffusion tube having a wall of non-porous metal through which particular gas permeates, said tube wall being adapted to selectively permeate said particular gas through said tube wall, extending through the chamber and being secured through the two end walls and opening outside the chamber, said tube having one portion within the chamber spirally coiled in one direction and another portion within the chamber spirally coiled in the opposite direction.

3,274,755
APPARATUS FOR THE ADSORPTIVE RECOVERY OF SOLVENTS
Jean R. Montagnon, La Celle-Saint Cloud, and Georges Gourdon, Montrouge, France, assignors to Societe Nouvelle Pica, Paris, France
Filed June 21, 1962, Ser. No. 204,176
Claims priority, application France, July 10, 1958, 110,006
7 Claims. (Cl. 55—171)



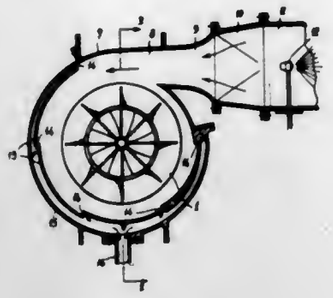
1. Solvent recovering apparatus comprising, in combination, a hollow casing provided at a given elevation with an outlet means capable of being opened and closed; inlet means communicating with the interior of said casing at a second elevation substantially lower than said given elevation; a first pair of means both communicating with said inlet means and alternately operable for alternately introducing solvent-carrying air and pure air, respectively, into said casing through said inlet means; a body of activated charcoal situated in the interior of said casing at an elevation lower than said given elevation but higher than said second elevation and defining a flow path through which air must pass before reaching said outlet means; heat exchanger means situated in said casing beneath said body of charcoal but at an elevation higher than said second elevation; a second pair of means communicating with said heat exchanger means for alternately circulating therethrough a cooling fluid and a heating fluid, respectively; steam conduit means communicating with the interior of said casing at an elevation higher than said body of charcoal for directing steam downwardly through the latter; valve means in said steam conduit means for opening and closing the latter; and separating means situated in said casing at an elevation lower than said second elevation for collecting condensate from said heat exchanger means and separating the condensate into different liquid components thereof, whereby during a first stage of an operating cycle with said outlet means open that one of said first pair of means for introducing solvent-carrying air through said inlet means into said casing and that one of said second pair of means for circulating cooling fluid through said heat exchanger means can be rendered operative so that the solvent-carrying air will have solvent condensed therefrom by said heat exchanger means before passing through said body of charcoal to have further solvent removed therefrom before the air flows out through said outlet means, during a second stage of said operating cycle with said outlet means closed both of said first pair of means can be rendered inoperative while said one of said second pair of means is still maintained operative and steam is directed through said body of charcoal from said steam conduit means to remove from said charcoal solvent to be condensed with steam by said heat exchanger means and received in said separator means, and during a final stage of said operating cycle with said outlet means open the other of said first pair of means can be rendered operative for introducing pure air through said inlet means into said casing while the other of said second pair of

means can be simultaneously rendered operative for circulating heating fluid through said heat exchanger means to heat said pure air before it reaches said body of charcoal to dry the latter before reaching said outlet means.

3,274,756
APPARATUS FOR DEGASSIFYING A LIQUID

Bengt Evert Stern, Mullingstorp, Kuddby, Sweden

Filed Oct. 8, 1962, Ser. No. 229,143
1 Claim. (Cl. 55—182)



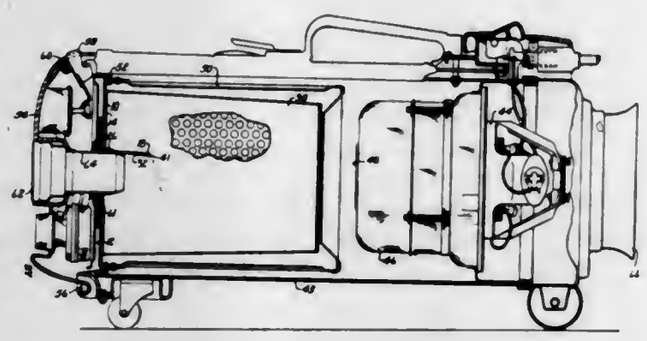
An apparatus for analyzing a sample of a vaporizable material for gases contained therein, comprising a housing, a motor mounted in said housing having a vertical shaft extending upwardly through said housing, a centrifuge bowl removably mounted on the upper end of said vertical shaft above the housing, said bowl being a shallow bowl having a rim which is turned over and extends downwardly to define an annular channel in the under surface of the bowl, said annular channel opening downwardly toward said housing, a bearing on said housing on which said bowl rotates, sealing means between the bottom of said bowl and said housing and comprising a first seal radially outwardly of said annular channel and a second seal radially inwardly of said annular channel, a system of tubes opening into said annular channel through said housing at points opposite said annular channel for conducting a heating medium to and from said annular channel, a cover above said bowl, a gas seal means extending between the inside surface of said cover and the periphery of said bowl and permitting relative rotation between the cover and the bowl, means extending through said cover for projecting a sample into the bowl against the inside surface of the bowl, a gas inlet opening through said cover into the radially inner portion of said bowl and a gas outlet means opening out through the cover from the radially outer portion of said bowl for picking up gases vaporized when a sample is centrifuged and heated, a fixed pillar on said housing, and clamping means vertically movable on said pillar and on which said cover is mounted.

3,274,757
COMBINATION GAS TURBINE AND DUST SEPARATOR

Jean Jacques Wapler, Lille, Nord, France, assignor to Societe Anonyme des Etablissements Neu, Lille, Nord, France, a corporation of France

Filed May 11, 1964, Ser. No. 366,399
Claims priority, application France, May 16, 1963, 18,221, Patent 1,390,923
1 Claim. (Cl. 55—238)

A combination gas turbine and dust separator adapted to be driven by the expansion of dust laden gases, and comprising: a spiral shaped housing, a gas inlet having a convergent portion leading tangentially into said housing, a divergent gas outlet leading axially from said housing, a centripetal type turbine wheel rotatively mounted within said housing coaxially with said gas outlet and immediately adjacent said inlet, said wheel comprising a central hub portion and an outer shield portion, axially extending blades mounted between said hub and shield portions, said blades and said portions providing a centripetal gas passage from outwardly of said wheel into said gas outlet, a spiral shaped plate means mounted between said wheel and the inner wall of said housing and spaced away from



said inner wall, dust discharge openings in said plate means circumferentially spaced apart from each other and leading into the space formed between said plate means and said inner wall, an outlet from said space for the dust collected therein; and a liquid atomizing means in said gas outlet in advance of said convergent portion.

3,274,758
DISPOSABLE VACUUM CLEANER DUST CONTAINERS

Henry O. Parman, Owensboro, Ky., assignor to Electrolux Corporation, Old Greenwich, Conn., a corporation of Delaware

Filed Jan. 9, 1963, Ser. No. 250,414
1 Claim. (Cl. 55—279)

A disposable dust bag for use in a vacuum cleaner having an inlet conduit, said bag including a relatively stiff end member having an inlet opening, a sheet of rubber-like material secured to said end member and extending across said opening, said sheet having a normally small aperture approximately centered with respect to said inlet opening, a strip of flexible material secured to said end member and extending across said opening and over said aperture, said strip having a frangible section adjacent to one end thereof so as to be severed and forced through said aperture by the introduction of said inlet conduit into said inlet opening, a container of impermeable frangible material secured to said end member and extending across said inlet opening in substantially parallel relation to said strip and notched adjacent to said frangible section so as to be ruptured and forced through said inlet opening along with said strip by the aforesaid introduction of the inlet conduit, and a volatile deodorizing substance in said container releasable to the interior of said bag by the rupturing of the container.

3,274,759
ADJUSTABLE FRAME STRUCTURE FOR AIR FILTERS AND THE LIKE

Vincent G. Bell, Jr., Wayne, Pa., assignor to Safeguard Business Systems Corporation, a corporation of Delaware

Filed Apr. 7, 1965, Ser. No. 446,226
2 Claims. (Cl. 55—482)

1. An adjustable frame structure for window air-filters and the like, comprising:

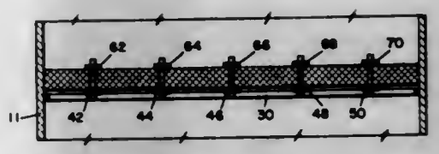
a first generally-rectangular frame including a first pair of substantially identical horizontally-extending vertically spaced-apart rails and a first pair of end-frame members secured to opposite ends of said rails to hold said rails in substantially parallel relationship to each other;

each of said rails having formed therein a first keyed channel, a second keyed channel, a third channel and a fourth channel, each of said channels extending throughout the entire length of said rails;

said fourth channel in each of said rails facing inwardly of said frame to permit mounting for an air filter therein, said first keyed channel in each of said rails facing oppositely to said fourth channel, said second keyed channel in each of said rails facing horizontally outward from one side of said frame and having a substantially rectangular cross-section, and said third channel in each of said rails facing oppositely to said second keyed channel;

a second generally rectangular frame of substantially the same form as said first frame and including a second pair of horizontally-extending rails substantially identical with each other and with said first pair of rails and each having a first and second keyed channel and a third and a fourth channel all of which are of substantially the same form as said channels in said first pair of rails, and a second pair of end-frame members secured to opposite ends of said second pair of rails to hold said second pair of rails in substantially parallel, vertically spaced-apart relationship, said second pair of end-frame members being of substantially the same form as said first pair of end-frame members;

one of said first pair of end-frame members having a pair of key members integrally formed thereon, each of said key members having a key portion of substantially rectangular cross-section retained in closely-fitting longitudinally-slidable relationship in a different one of said second keyed channels in said second pair of rails, and one of said second pair of end-frame members having a pair of key members integrally formed thereon, each of said last-named key members having a key portion of substantially rectangular cross-section retained in closely-fitting longitudinally-slidable engagement in a different one of said second keyed channels in said first pair of rails;



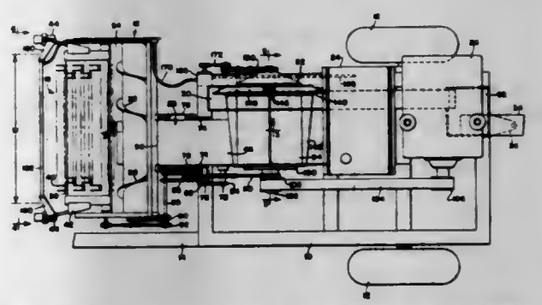
resilient gaskets extending the length of said rails and retained in said first keyed channels thereof; and

connector means extending longitudinally into the ends of said third channels at the ends of each of said rails and secured to said end-frame members and the interior walls of said third channels for securing said end-frame members to said rails.

3,274,760
DEMISTIFIER SCREEN AND SUPPORT THEREFOR

William J. Sage, Edmonton, Alberta, Canada, assignor to Esso Research and Engineering Company, a corporation of Delaware

Filed July 31, 1964, Ser. No. 386,587
5 Claims. (Cl. 55—491)

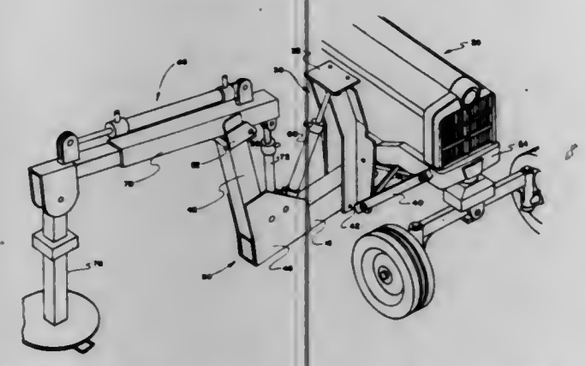


1. A self-supporting screen structure for use internally within a cylindrical vessel through which a fluid flows comprising, in combination, an annular member defining a plane and having at least one interruption therein to provide spaced facing end elements, means for adjusting the spacing between said end elements to thereby expand the outside diameter of said annular member into frictional engagement with the interior walls of said vessels, a plurality of upstanding rod elements having one end secured to an inner portion of said annular member, said rod element extending in a direction perpendicular to the plane of said annular member, a plurality of individual and varying length transverse bar elements extending substantially parallel to one another, having end portions engaging said rod elements, at least one end portion of each bar element having a slot which slidably engages an associated rod element, each said slot being elongated along the lengthwise axis of said bar elements for permitting free relative movement between said rod elements and annular member as said annular member is expanded into contact with said cylindrical vessel, and previous screen means adapted to extend transversely completely across said cylindrical vessel and to overlie said bar elements, and means for securing said screen means to said bar elements.

3,274,761
CROP WAFERING MACHINE

Gust Soteropulos, Harold E. de Buhr, and Blaine W. Gustafson, all of Ottumwa, Iowa, assignors to Deere & Company, Moline, Ill., a corporation of Delaware

Filed Feb. 21, 1964, Ser. No. 346,540
11 Claims. (Cl. 56—1)



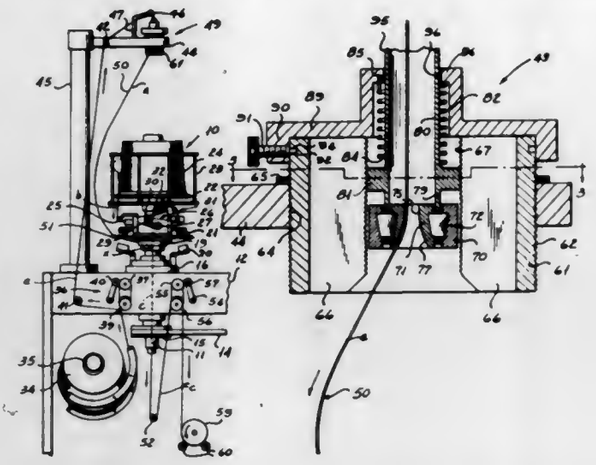
1. A machine for wafering hay and like forage crops from relatively wide previously formed and at least partly cured windrows, comprising: a mobile frame adapted to travel over the field parallel to the windrows; crop pick-up means carried by the frame and of sufficient width to span a windrow and to pick up crops from such windrow and to move the crops rearwardly in a relatively

wide stream; crop-wafering means on the frame in spaced relation to the pick-up means; crop-transfer means on the frame between the pick-up means and the wafering means and having a receiving portion proximate to and for receiving crops from the pick-up means, a delivery portion proximate to and for delivering crops to the wafering means, and feed means for moving crops from the receiving portion to the delivery portion; means on the frame including a container for carrying a crop-wetting liquid; and means on the frame and connected to the container and disposed in proximity to the pick-up means for distributing liquid to the crops over a relatively wide area prior to movement of the crop stream into the aforesaid receiving portion.

3,274,762
MOUNTING FOR MOWER ATTACHMENT

Lewis M. Jolls, 602 Walnut St., Brighton, Mich.; Ilene Timmons, administratrix of said Lewis M. Jolls, deceased

Filed Dec. 5, 1963, Ser. No. 328,331
1 Claim. (Cl. 56—25.4)



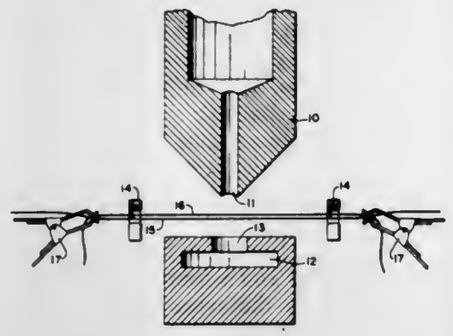
A mounting for a mower attachment on a vehicle having a frame, said attachment having a cutter bar comprising, an elongated beam and an upstanding post forming a generally L-shaped support member, means supported upon said post for pivotally supporting said mower attachment intermediate its ends, a pair of brackets attached to opposite sides of said frame, the lower portions of said brackets extending below said vehicle and being in spaced, parallel relation, means for pivotally supporting the end of said beam remote from said post upon one of said brackets, the other of said brackets disposed to support the end of said beam proximate to said post against horizontal movement but to permit vertical movement thereof, a pair of actuating means each connected at one end to said support member and at the other end, respectively, to the upper portion of said other bracket and to the proximate end of said mower attachment, to adjustably support said mower attachment upon said vehicle.

3,274,763
TWISTING SPINDLE BALLOON CONTROL

Alfred W. Vibber, 290 Churchill Road, West Englewood, Teaneck, N.J.

Filed Dec. 17, 1963, Ser. No. 331,149
7 Claims. (Cl. 57—106)

1. A self-adjusting balloon apex guide comprising a planetary gearing device having a ring and parts rotatable with respect to the ring including a sun coaxial of the ring, and at least one body of revolution functioning as a planet interposed between and drivingly engaging the ring and sun, the sun being in the form of an annular member having a central strand guiding passage therethrough, means for retaining the ring from rotation while permitting its reciprocation along the common axis of the ring and the sun, and means supporting the planetary gearing device and for adjusting it along said axis comprising means connected to the planet to rotate therewith about said axis, means connected to the last named means to drive the planetary gearing device for travel in opposite directions along said axis when the sun rotates

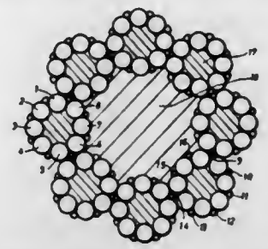


about said axis in respective opposite directions, and resilient means connected to one of the rotatable parts of the planetary gearing device yieldingly to oppose rotation of the sun in the direction of rotation of the balloon.

3,274,764
THREAD JOINT

Conrad J. Gonsalves, Arnhem, Netherlands, assignor to American Enka Corporation, Enka, N.C., a corporation of Delaware

Original application Nov. 4, 1963, Ser. No. 321,244. Divided and this application Feb. 4, 1966, Ser. No. 525,179
Claims priority, application Netherlands, Nov. 14, 1962, 285,518
1 Claim. (Cl. 57—142)



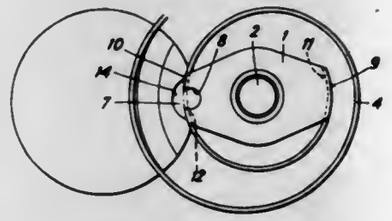
A thread joint formed solely by the ends of at least two multifilament threads having a low twist equal to or less than one turn per inch, said filaments of each thread being entangled with the filaments of the other thread in permanent engagement therewith and without further twist whereby the tensile strength of the joint is substantially the same as that of the thread.

3,274,765
STRANDED ROPE COMPRISING ENDLESS, SYNTHETIC PLASTIC THREADS

Karl Hartmann, Cologne-Stammheim, and Hans-Richard Schmittmann, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

Filed June 18, 1965, Ser. No. 465,055
7 Claims. (Cl. 57—144)

1. A stranded rope of synthetic plastic material comprising strands formed of surface filaments stranded about a core and having fiber tows consisting of parallel elementary plastic filaments inserted externally between the surface filaments wherein said fiber tows in said strands are non-supporting rope elements having substantially no

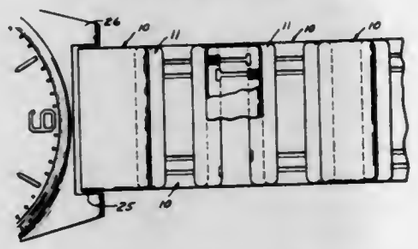


initial tension, said fiber tows being inserted between the surface filaments to prevent wear of said filaments.

3,274,766
FIXING DEVICE OF THE INNER END OF A REGULATING HAIRSPRING IN A TIMEPIECE

Jean-Jacques Desaules and Henri-Louis Henchoz, Le Locle, Switzerland, assignors to Fabrique d'Horlogerie Chs. Tissot et Fils S.A., Le Locle, Neuenburg, Switzerland

Filed Nov. 16, 1964, Ser. No. 411,286
Claims priority, application Switzerland, Jan. 31, 1964, 1,156/64
8 Claims. (Cl. 58—115)

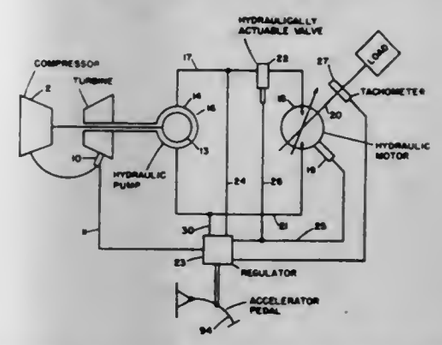


1. In a hair-spring and collet assembly for time pieces, in combination, an outer convex side surface portion on the collet, a portion of the hair-spring inner coil having an inner side surface applied against said outer convex side surface portion of the collet, a blob of material firmly fixed to said portion of the hair-spring inner coil and having a projection extending inwards from the inner side surface thereof, and a lodging in the collet provided in said outer convex said surface portion thereof, the inwardly extending projection of said blob of material entering said lodging and constituting therewith a fixing connection ensuring the anchorage of the hair-spring to the collet.

3,274,767
ELASTICALLY EXPANDABLE WATCHBAND

George G. Henschel, 226—69 Union Turnpike, Flushing, N.Y.

Filed Aug. 14, 1963, Ser. No. 302,173
2 Claims. (Cl. 59—79)

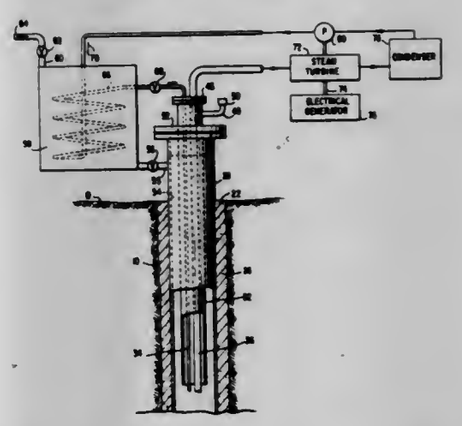


1. A watchband comprising a plurality of upper and lower band links disposed in two spaced-apart superimposed parallel rows. said band links being in the form of a hollow substantially rectangular block having transverse parallel slots in opposite side walls, a coupling link interposed between each adjacent upper band link and lower band link, retaining means fitted in the interior of each of said blocks to define therein guide tracks in registry with said slots, each of said coupling links including a pair of guide tongues protruding from opposite sides of the coupling link, each of said tongues engaging one of the guide tracks of the adjacent upper band link and lower band link, respectively, slidably displaceable along the tracks, and spring means oppositely acting upon the two tongues of each coupling link for biasing the respective band links in both rows and the respective coupling link toward each other.

3,274,768
PRIME-MOVER SYSTEM

Hans-Christof Klein, Hattersheim (Main), Germany, assignor to Alfred Teves Maschinen- und Armaturenfabrik Kommandit-Gesellschaft, Frankfurt am Main, Germany, a limited-liability company of Germany

Filed Nov. 26, 1963, Ser. No. 325,916
Claims priority, application Germany, Dec. 3, 1962, T 23,114
14 Claims. (Cl. 60—19)

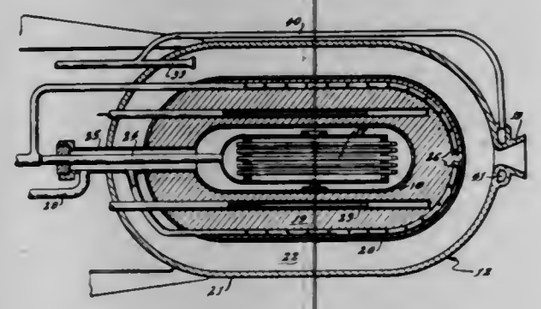


1. A method of operating a turbine prime mover wherein a gas turbine is connected to a compressor feeding said turbine, comprising the steps of:
driving relatively displaceable cooperating pumping members of a hydraulic pump with said turbine and said compressor, respectively, to displace hydraulic fluid at a rate proportional to the difference in speeds of said compressor and said turbine; and
driving a hydraulic motor connected to a load with the hydraulic fluid displaced by said pump.

3,274,769
GROUND HEAT STEAM GENERATOR

Jay B. Reynolds, Fallon, Nev., assignor to J. B. Reynolds, Inc., Fallon, Nev., a corporation of Nevada

Filed May 5, 1964, Ser. No. 364,902
5 Claims. (Cl. 60—26)



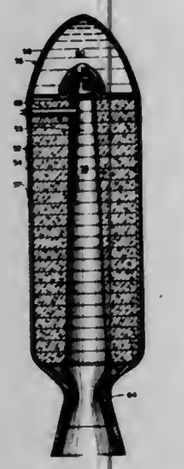
1. A device for extracting energy from the earth comprising a cylindrical container having a closed end insertable into a well and adapted to be filled with fluid, a liquid pipe and a gas pipe extending into said container

and in fluid communication with each other adjacent said closed end of said container, said gas pipe being of larger diameter than said liquid pipe.

3,274,770
METHOD AND SYSTEM FOR SUPPLYING THRUST TO A SPACE VEHICLE

Joseph C. Carter, Elmhurst, and Max B. Rodin, Park Forest, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission

Filed Feb. 9, 1966, Ser. No. 526,667
3 Claims. (Cl. 60—203)

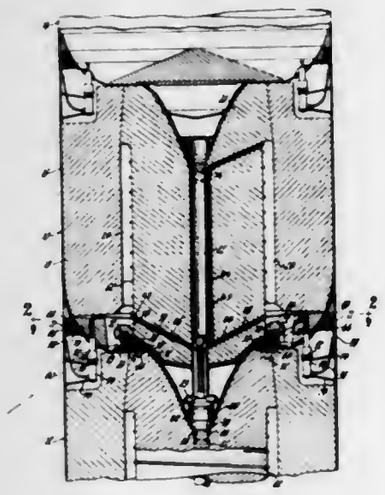


1. A nuclear propulsion system for use in space comprising a solid-core liquid-metal-cooled nuclear reactor, a beryllium reflector surrounding the reactor, means establishing an irradiation zone surrounding the reflector, means for introducing molten lithium hydride enriched in lithium-6 into said irradiation zone, and means for ejecting the resulting gas containing products of the reaction of neutrons and lithium-6 from the irradiation zone to provide thrust.

3,274,771
HYBRID SOLID AND LIQUID FUEL ROCKET

Irving Lieberman, Covina, and Louis Zernow, Downey, Calif., assignors to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio

Filed Oct. 23, 1961, Ser. No. 146,755
1 Claim. (Cl. 60—251)



A hybrid rocket of the class described comprising in combination, a housing having a closed forward end and a nozzle at its rear end, a partition wall dividing said housing into a forward and a rear compartment, the rear housing compartment containing a solid fuel grain therein, said solid fuel grain having its outer periphery in engagement with the internal surface of said housing and being provided with an elongated opening extending the length thereof in registration with said nozzle, the forward compartment comprising a tank filled with a liquid oxidizing material adapted to react with the material of said solid fuel grain for achieving combustion, said partition wall including an injection plate as the central portion thereof, said injection plate being provided with a plurality of orifices leading into the elongated opening in said solid fuel grain, dome-shaped closure means on said injection plate covering said orifices to prevent indiscriminate flow of liquid oxidizing material through said orifices into the elongated opening in said solid fuel grain, and said dome-shaped closure means including a pump therein having an intake communicating with said tank filled with liquid oxidizing material and a discharge outlet communicating with said orifices, whereby the operation of said pump forces liquid oxidizing material from said tank through the orifices in said injection plate into the elongated opening in said solid fuel grain, thereby causing a reaction between the liquid oxidizing material and the solid fuel grain generating combustion products which flow out through said nozzle to provide thrust.

3,274,772
CONTINUOUSLY STAGED ROCKET CONSTRUCTION

Cyril M. Hawkins, Indianapolis, Ind., and Albert J. Sobey, Birmingham, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

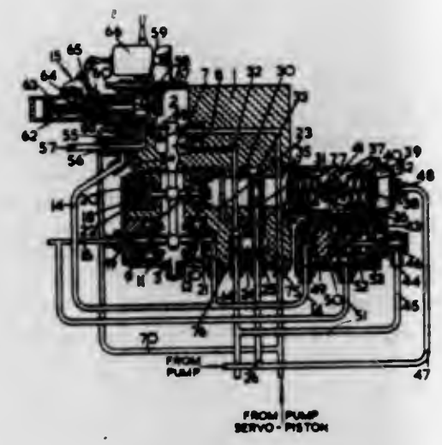
Filed July 16, 1963, Ser. No. 295,429
5 Claims. (Cl. 60—225)

1. A rocket engine stage unit adapted to be combined with other like stage units to form a multi-stage solid propellant rocket engine, said stage unit comprising:

an outer casing;

two annular rings of solid propellant disposed within said casing and separated by a space forming an annular gas passage;

an annular exhaust nozzle located adjacent to said annular gas passage at the lower extremity of said casing, said annular nozzle having a two-piece construction including spacers selectable to determine the throat area of said nozzle at assembly;



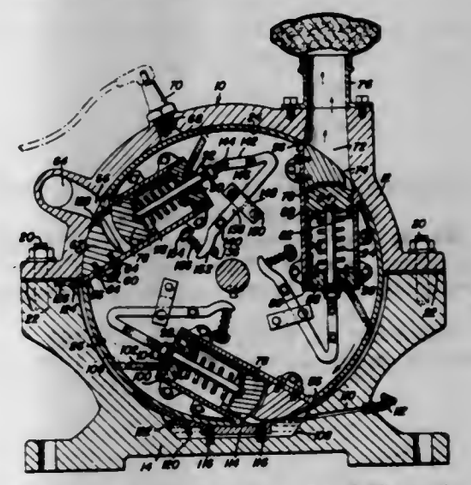
heat responsive ignition means including a thermal initiator, end primers ignited by said initiator, and a detonating fuse extending from said end primers to said solid propellant rings;

and an explosive stage separation means to separate an adjacent stage unit from said stage unit when the combustion of said adjacent stage unit nears completion.

3,274,773
GOVERNOR CONTROL FOR A FUEL SYSTEM OF A GAS TURBINE POWER-PRODUCING PLANT

Robin M. Dakin, Coventry, England, assignor to Bristol Siddeley Engines Limited, Bristol, England

Filed Jan. 13, 1964, Ser. No. 337,251
Claims priority, application Great Britain, Jan. 16, 1963, 1,930/63
4 Claims. (Cl. 60—39.28)



1. A governor control for a fuel system of a gas turbine power-producing plant, including a power turbine, the governor control comprising a pivotally-mounted arm; a valve member carried on said arm and arranged to control the fuel supply to said plant; a first pair of pressure-responsive means positioned to apply a first pair of opposed forces on said arm, one of said first means being responsive to a pressure signal dependent upon turbine speed and the other of said first means being responsive to a fluid pressure signal representing a datum speed; a second pair of pressure-responsive means arranged to apply a second pair of opposed forces on said arm, one of said second means being responsive to a direct feedback pressure derived from the fuel being controlled and the other of said second means being responsive to a delayed feed-back pressure; means defining a chamber; a restricted inlet to said chamber from a fuel supply line; a restricted outlet from said chamber; a first pressure-responsive device, responsive to the internal pressure in said chamber and constituting said delayed feedback means; a second pressure-responsive device, positioned remotely from said first device and responsive to the internal pressure in said chamber; resilient means acting on said second device in opposition to said internal pressure, and a further pressure-responsive device applying an external pressure signal on said second device, the latter thereby being operable to vary the internal pressure in said chamber, as a result of the combined effect of the fluid pressures and the resilient means acting on said second pressure-responsive device, said external pressure signal being a function of the difference between said turbine speed and datum speed pressure signals applied respectively to said first pair of pressure-responsive means.

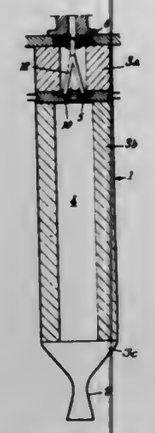
3,274,774
RECIPROCATING PISTON ROTATING CYLINDER BLOCK ROTARY ENGINE

Nick A. Leone, Lohrville, Wis., assignor of ten percent each to Albert C. Fell, Ann A. Fell, James F. Murray, and Betty J. Murray, Milwaukee, Wis.

Filed Sept. 11, 1964, Ser. No. 395,778
9 Claims. (Cl. 60—39.34)

1. A rotary cylinder reciprocating piston engine comprising a casing defining a generally cylindrical cavity, a rotor journaled in said cavity and substantially filling the latter, said rotor including a generally circular base disk and a cylindrical axially projecting outer peripheral wall projecting laterally of one side of said disk, said peripheral wall being snugly received in said cavity and having a plurality of circumferentially spaced openings formed therein, a plurality of cylinder members secured to said one side of said disk at points spaced circumferentially thereabout and extending generally along chords thereof with one set of corresponding open ends of said cylinder members defining ports sealed relative to the portions of said peripheral wall defining said openings, a piston reciprocable in each of said cylinder members, means operatively connected between said pistons and said cylinder members yieldingly urging said pistons toward said one set of ends and limiting movement of said pistons toward the other set of corresponding ends of said cylinder members, coacting means carried by said pistons and said casing operable to intermittently and

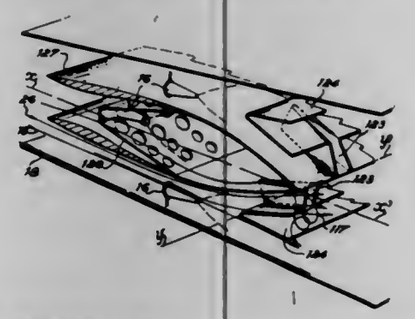
sequentially move said pistons toward the other set of corresponding ends of said cylinder members and release said pistons for returning toward said one set of ends upon rotation of said rotor in said casing, air and fuel inlet means in said casing opening generally radially of said cavity at a point with which said ports are sequentially registered when said coacting means are moving the corresponding pistons toward said other set of ends, exhaust port means in said casing opening generally radially of said cavity at a point spaced circumferentially of said fuel inlet means and with which said ports are also sequentially registerable, and fuel ignition means communicated with said cavity at a point spaced circumferentially thereof between said inlet and exhaust port means and with which said ports are further registerable after their registery with said inlet means and before their registery with said exhaust port means in the direction of rotation of said rotor relative to said casing.



3,274,775
HOT GAS GENERATORS AND IN PARTICULAR ROCKET MOTORS

Pierre Berton, Boulogne-sur-Seine, France, assignor to Office National d'Etudes et de Recherches Aerospatiales, called O.N.E.R.A., Chatillon-sous-Bagneux, Seine, France, a society of France

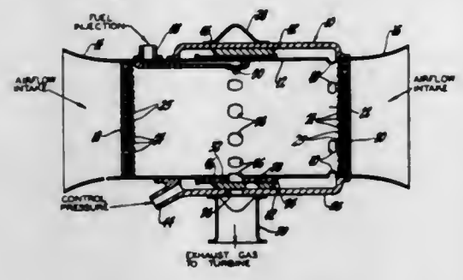
Filed July 15, 1963, Ser. No. 294,831
Claims priority, application France, July 18, 1962, 904,385
19 Claims. (Cl. 60—39.47)



1. A hot gas generator wherein energy is supplied by the reaction with each other of two components, to wit a fluid one and a solid one, respectively, which generator comprises, in combination, a casing, said solid component being disposed in said casing to form therein a reaction chamber for the flow of fluids therethrough, a first injector device for introducing said fluid component into said chamber, means in said chamber downstream

of said injector device forming an obstacle across the longitudinal path of travel of fluids through said chamber

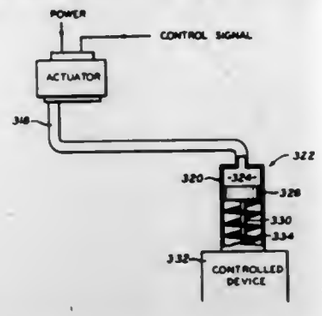
to produce turbulency in the flow of said fluids and a second injector device opening into said chamber and carried by said obstacle.



3,274,776
COMBUSTION CHAMBERS OF REACTION PROPULSION UNITS
Maurice Ravel, Morsang-sur-Orge, France, assignor to Nord-Aviation Societe Nationale de Constructions Aeronautiques, Paris, France, a joint-stock company of France
Filed Jan. 26, 1965, Ser. No. 428,181
Claims priority, application France, July 6, 1964, 980,889
2 Claims. (Cl. 60—39.74)

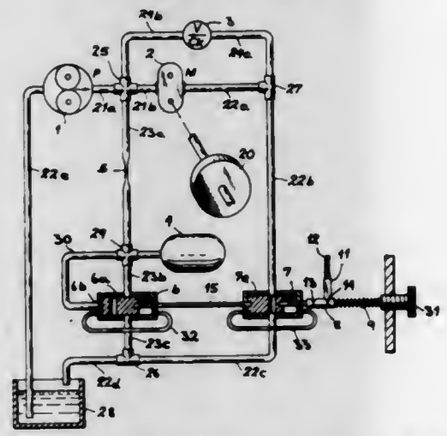
1. In a propulsion reactor,
a combustion chamber having a pair of highly divergent walls with curved planar interior portions between which a flow of air passes,
a pilot flame stabilizing device within said combustion chamber having a pair of curved planar surface portions opening toward the flow of air passing through said combustion chamber,
at least one burner within said stabilizing device,
at least one additional burner located between said stabilizing device and at least one interior wall of said combustion chamber,
conduit means projecting through said planar surface of said stabilizing device and communicating with said additional burner, and
fuel injector means for feeding carburized fuel to said burners.

3,274,777
WAVE ENGINE GASIFIER
Roy S. Cataldo, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 12, 1965, Ser. No. 471,006
14 Claims. (Cl. 60—39.77)



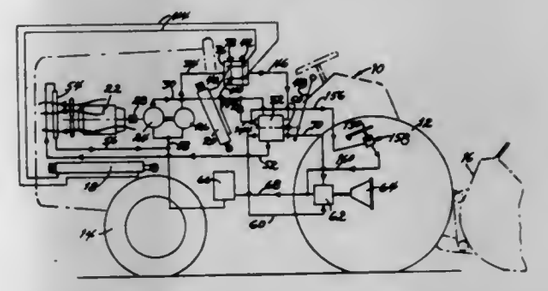
1. An internal combustion wave engine gasifier comprising:
a duct having at least one side wall and a pair of end walls defining a chamber, said chamber having a central portion approximately equidistant from said end walls and adapted to receive a charge of air,
fuel supplying means to deliver a charge of fuel to said chamber central portion for combustion with said air charge, whereby a pair of oppositely directed pressure waves of substantially equal intensity are caused to move outwardly from said central portion, striking said end walls and being at least partially reflected back toward said central portion, said pressure waves being followed by a pair of expansion waves,
exhaust means in said side wall and connecting with said chamber central portion, said exhaust means being openable to permit said reflected pressure waves to force the combustion gases from said central portion and deliver a fresh air charge thereto and said exhaust means being closable to retain said fresh air charge in said central portion and permit said reflected pressure waves to precompress said fresh air charge prior to delivery of an additional charge of fuel for combustion in said central portion, and
fresh air inlet means in each of said end walls and being openable to permit said expansion waves to draw fresh air into said chamber ends for movement to said chamber central portion during a subsequent cycle.

13. A wave engine gasifier comprising:
a cylindrical duct having a peripheral wall and a pair of end walls enclosing a chamber,
a plurality of pressure actuated one-way inlet flapper valves in each of said end walls and adapted to admit air to the ends of said chamber whenever the pressure in said chamber adjacent said flapper valves is substantially below ambient,
a plurality of exhaust opening means annularly spaced around said peripheral wall intermediate said end walls and equidistant therefrom,
an axially reciprocable annular exhaust valve surrounding said valve opening means to control the passage of exhaust products therefrom and
fuel injection means including a fuel spray nozzle, in said chamber equidistant from said end walls and adapted to supply fuel to said chamber at substantially the moment of peak compression caused by shock waves meeting at the center of said chamber whereby to cause detonative combustion of said fuel and start a pair of oppositely directed compression shock waves toward said end walls.



3,274,778
ACTUATOR WITH HIGH FLUID PRESSURE
Joseph M. Tyrner, M.R. 17, Morristown, N.J.
Filed Mar. 10, 1965, Ser. No. 438,556
17 Claims. (Cl. 60—52)

1. An actuator including a body enveloping an internal chamber which corresponds generally to the outer surface of the body in the two dimensions of that surface and which includes walls closely spaced in the dimension perpendicular to said outer surface, said chamber being filled with an electrically-conductive liquid, barrier means in the chamber extending in the narrow dimension and dividing the chamber into a multiplicity of communicating subchambers, an electric circuit for establishing a magnetic flux traversing the chamber in the direction of the narrow spacing and for establishing a current flow through the liquid in a direction transverse of the magnetic flux, and other means including a second electric circuit

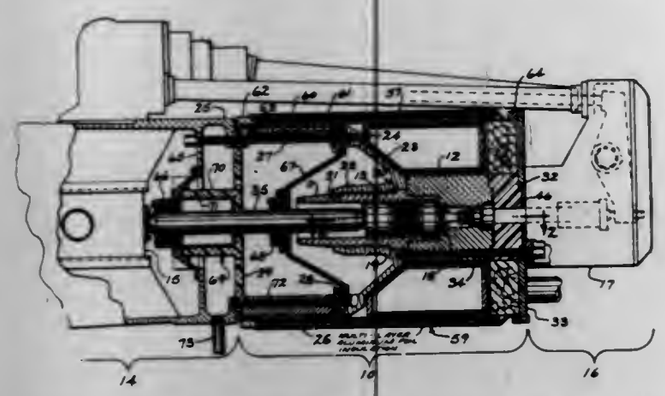


and a flux device on the body and controlled by the second electric circuit whereby to vary the flux established by the first electric means in accordance with control signals imparted to said other means.

3,274,779
FLOW REGULATOR FOR FLUID SYSTEMS
Hans-Christof Klein, Hattersheim, Germany, assignor to Alfred Teves Kommanditgesellschaft, Frankfurt am Main, Germany, a corporation of Germany
Filed Dec. 17, 1964, Ser. No. 419,030
Claims priority, application Germany, Dec. 18, 1963, T 25,285
8 Claims. (Cl. 60—53)

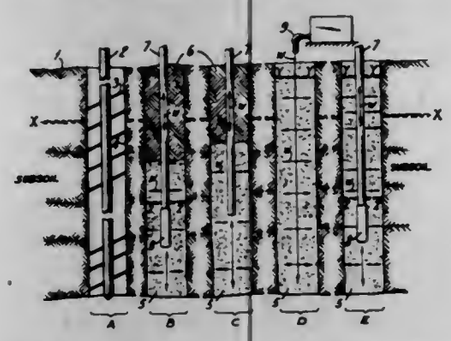
1. In a propulsion system for the displacement of a driven unit by a source of fluid under pressure, said system including first conduit means extending from a discharge port of said source to an inlet side of said unit and second conduit means extending from an outlet side of said unit to an intake port of said source, the combination therewith of third conduit means connecting said first conduit means with said second conduit means; throttle meas in said third conduit means; first valve means in said third conduit means between said throttle means and said second conduit means; second valve means in said second conduit means between said outlet side of said unit and a junction of said second and third conduit means, said second valve means being ganged with said first valve means for joint oscillation between a first position and a second position, said second conduit means being unblocked by said second valve means in said first position only for operation of said unit by fluid from said source, said third conduit means being unblocked by said first valve means in said second position only for bypassing fluid from said discharge port to said intake port; accumulator means for fluid under pressure connected to said third conduit means at a location between said throttle means and said first valve means; biasing means coupled with said first and second valve means for tending to maintain same in said first position; and actuating means responsive to fluid pressure at said location for urging said first and second valve means into said second position against the force of said biasing means upon said pressure reaching a predetermined maximum whereby said second valve means blocks said second conduit means ahead of said junction and said accumulator means discharges through said junction until the pressure at said location drops to a predetermined minimum allowing said biasing means to restore said first and second valve means to said first position.

3,274,780
CONTROL SYSTEM FOR HYDRAULIC DRIVE VEHICLES
Karl Salna, Mundelein, and Thorvald G. Granryd, Libertyville, Ill., assignors to International Harvester Company, a corporation of Delaware
Filed Mar. 8, 1965, Ser. No. 437,742
4 Claims. (Cl. 60—53)



1. In a vehicle supported by traction wheels, the combination including: a source of fluid under pressure; at least one hydraulic motor in driving connection with a traction wheel; a conduit connected with the source of fluid under pressure; selector valve means to selectively interconnect the conduit with the hydraulic motor; relief valve means to vent fluid from the conduit including a port in the conduit, a valve movable to a first position closing the port and to a plurality of other positions opening the port responsive to fluid pressure in the conduit, and spring means to urge the valve to the first position with a predetermined force; other means connected to the relief valve means to vary the predetermined force including a fluid chamber, control fluid under pressure in the chamber, and a piston having two ends, one of the ends connected with the spring means urging the valve and the other end slidable in the chamber between first and second positions responsive to the pressure in the chamber, the spring means being effective in any position of the piston to vent fluid from the conduit; and additional means to selectively vary the fluid pressure in the chamber.

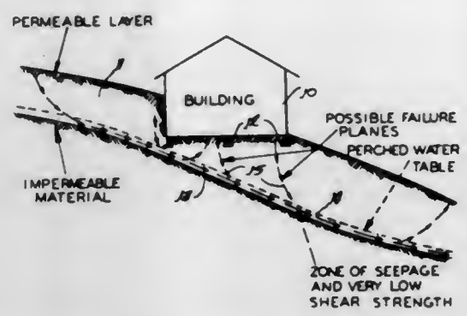
3,274,781
CRYOGENIC EXPANSION ENGINE
Willard A. Morain, Mount Vernon, John L. Ostborg, Springfield, and David White, Columbus, Ohio, assignors to The Cooper-Bessemer Corporation, Mount Vernon, Ohio, a corporation of Ohio
Filed June 17, 1963, Ser. No. 288,235
20 Claims. (Cl. 60—64)



3. A cryogenic expansion engine comprising: a crankcase having a cross head therein mounted for reciprocatory movement of predetermined stroke, a cylinder housing having a cylinder chamber therein in line with said cross head, a piston in said cylinder chamber, a piston rod connecting said piston to said cross head, a partition closing off said crankcase and containing an oil seal which slidably receives said piston rod, said cylinder housing being spaced from said oil seal by a distance at least equal to said predetermined stroke, a heat insulating section positioned between said crankcase and said cylinder housing, a cylinder head on the end of said cylinder housing opposite

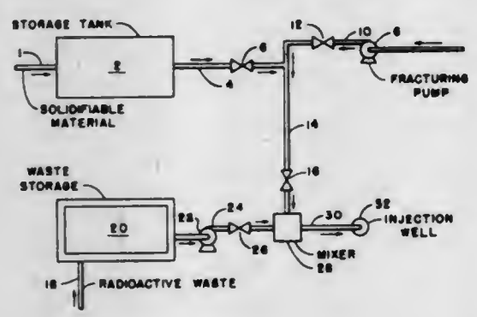
from said crankcase, a block of substantially non-compressible insulating material on the opposite side of said cylinder head from said cylinder housing, a valve rocker box positioned against the opposite side of said insulating material from said cylinder head, valve actuating means extending from said valve rocker box through

said insulating material into said cylinder head for regulating fluid flow into and out of said cylinder chamber, and whereby said cylinder housing and cylinder head are maintained at cryogenic temperatures while said crankcase and valve rocker box are maintained at approximately ambient temperatures.



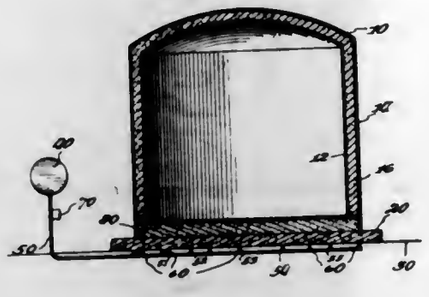
3,274,782
DEWATERING CLAYEY AND SILTY SOIL
Richard E. Landau, Middle Village, N.Y.
(717 Cornwell Ave., West Hempstead, N.Y. 11552)
Filed July 5, 1963, Ser. No. 293,163
6 Claims. (Cl. 61—11)

1. A method for locally controlling the fluid level in clayey or silty soils comprising
(1) forming a cavity in the soil by
(a) penetrating into the soil to the desired depth by helically cutting with a flight auger into the earth formation thereby to form a core of earth,
(b) removing the core from the soil by withdrawing the auger thereby to form a cavity,
(c) disposing a well-point at the desired depth in the cavity,
(2) actuating the well-point as a conduit for fluid flow,
(3) controlling the fluid flow in the well-point to control locally the fluid level in the soil.



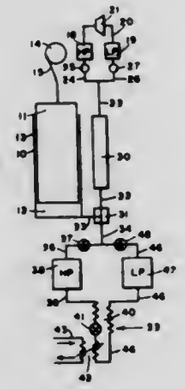
3,274,783
METHOD OF STOPPING LANDSLIDES AND SOIL SHEAR FAILURES
Richard L. Handy, Ames, Iowa, assignor to Soil Technical Associates, Inc., Des Moines, Iowa, a corporation of Iowa
Filed Jan. 10, 1964, Ser. No. 336,941
6 Claims. (Cl. 61—35)

1. In a method of stopping landslides and soil shear failures in soil above a laterally-extending, water-permeable sub-surface soil stratum which overlies a relatively water-impermeable stratum, said permeable soil stratum containing at least 10% by weight on a dry basis of montmorillonitic clay and being substantially saturated with water, thereby providing a perched water table which accentuates the tendency of said sub-surface soil stratum to form a shear zone, the sequence of steps comprising:
locating the position and thickness of said sub-surface soil stratum;



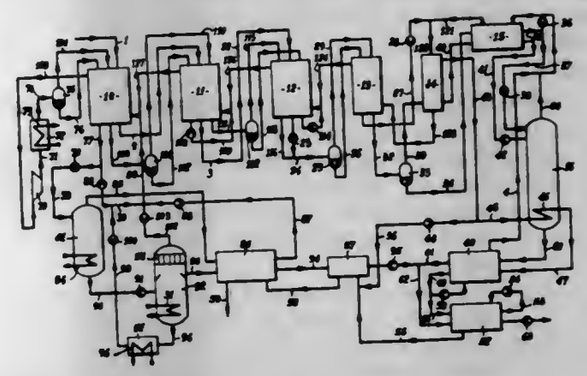
forming a series of vertically-extending, horizontally spaced-apart bore holes extending into said sub-surface soil stratum to approximately the depth of said water-impermeable stratum; and
filling said holes with lime at least up to the top of said perched water table-containing soil stratum, the quantity of lime thus deposited in the portions of said holes within said sub-surface soil stratum being from 0.3 to 9% by weight as calculated on a $Ca(OH)_2$ basis in relation to dry weight of the soil in the portion of said sub-surface soil stratum covered by said bore holes.

3,274,784
COMPOSITION AND METHOD FOR FIXING ATOMIC WASTE AND DISPOSAL
D'Arcy A. Shock, John D. Sudbury, and Preston L. Gant, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Filed Feb. 24, 1961, Ser. No. 88,246
20 Claims. (Cl. 61—36)



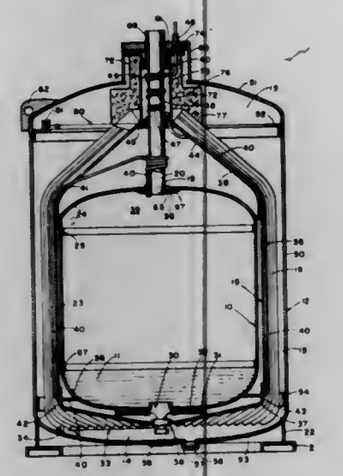
14. A method of subterranean disposal of radioactive waste which comprises providing a wellbore which penetrates an impermeable rock formation, fracturing the impermeable rock formatiton through the wellbore in a substantially horizontal direction to provide at least one fracture therein at a depth sufficient to provide shielding at the surface from the most energetic fraction of radioactive waste to be injected thereinto, said fracture being confined within said impermeable rock formation, injecting a solidifiable material containing radioactive waste into a fracture so formed in said impermeable rock formation and thereafter injecting additional solidifiable material free of radioactive waste to seal the radioactive waste in said impermeable rock formation.

3,274,785
APPARATUS FOR PREVENTING ICE AND FROST FORMATION UNDER LOW TEMPERATURE TANKS
Kenneth W. Lange, Hinsdale, Ill., assignor to Chicago Bridge & Iron Company, Hinsdale, Ill., a corporation of Illinois
Filed June 19, 1963, Ser. No. 289,063
2 Claims. (Cl. 61—36)



1. Apparatus for the prevention of frost and ice formation below a storage tank comprising:
a plurality of conduits arranged in the ground surface below said tank;
means for generating a substantially dry gas;
a plurality of nozzles secured to said conduits through which said dry gas is emitted; and
means for introducing said dry gas into said conduits and maintaining the pressure of said dry gas below said tank at a level above the ambient atmospheric pressure.

3,274,786
CRYOGENIC REFRIGERATION METHOD AND APPARATUS OPERATING ON AN EXPANSIBLE FLUID
Walter H. Hogan, Wayland, and Robert W. Stuart, Wakefield, Mass., assignors to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed July 27, 1964, Ser. No. 385,436
33 Claims. (Cl. 62—6)



1. A cryogenic refrigeration apparatus in which a movable member defines within an enclosure at least one chamber of variable volume and in which a high-pressure expansible fluid is introduced through a fluid flow path, incorporating at least one heat storage means, into said chamber and is subsequently expanded and then discharged through said fluid flow path to a low-pressure reservoir, characterized by having a Joule-Thomson loop associated with said chamber, said Joule-Thomson loop comprising
(a) a high-pressure ballast in fluid communication with said fluid chamber and adapted periodically to receive cold high-pressure fluid from said chamber,
(b) an expansion valve adapted to expand to further cool said high-pressure fluid delivered thereto from said high-pressure ballast at an essentially constant rate,
(c) a heat exchanger adapted to effect out-of-contact heat exchange between said cold high-pressure fluid entering said expansion valve and the expanded and further cooled fluid resulting from passage through said expansion valve; and
(d) means for returning said expanded and further cooled fluid in heat exchange relationship with said heat storage means to said low-pressure reservoir over at least that period of time corresponding to that part of each refrigeration cycle when said fluid is being expanded and discharged to said low-pressure reservoir.

3,274,787
METHOD FOR COOLING A GASEOUS MIXTURE TO A LOW TEMPERATURE
Maurice Grenier, Paris, and Pierre Petit, Chatenay Malabry, France, assignors to L'Air Liquide, Societe Anonyme pour l'Etude et l'Exploitation des Procedes Georges Claude
Filed Sept. 2, 1965, Ser. No. 484,541
Claims priority, application France, Sept. 18, 1964, 988,679, Patent 86,485
7 Claims. (Cl. 62—23)

1. In a method for cooling a gaseous mixture to low temperature and producing at least one constituent of this mixture in liquid phase, comprising subjecting a first gaseous mixture to a fractionate condensation in a plurality of heat-exchange stages with at least one of the condensed fractions being expanded to a first pressure and vaporized in heat exchange with said first gaseous mixture undergoing fractionate condensation, expanding to a second pressure said at least one constituent after its condensation and withdrawing said expanded constituent as product, said first pressure being substantially higher than said second pressure, thereafter recompressing said at least one fraction to a third pressure substantially higher than said first pressure, and recombining said recompressed fraction with said first gaseous mixture; the improvement comprising progressively cooling a second gaseous mixture in a plurality of heat-exchange stages with said first mixture, said second mixture having the same main components as said first mixture, and maintaining said first gaseous mixture with said second gaseous mixture separate at least until they are under conditions of temperature and pressure such that said constituent to be produced in liquid phase is at least mostly condensed within said second gaseous mixture and said at least one condensed fraction has been withdrawn from said first gaseous mixture for expansion and vaporization.

3,274,788
CRYOGENIC LIQUID STORAGE VESSEL
Thomas E. Hoffman, Marblehead, Walter H. Hogan, Wayland, Robert M. Lucas, Melrose, and Raymond W. Moore, Jr., Brookline, Mass., assignors to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed June 14, 1965, Ser. No. 463,792
15 Claims. (Cl. 62—45)

1. In a cryogenic liquid storage vessel formed of an inner vessel having a neck section, an outer vessel and an evacuated space therebetween in which is located radiation shield means, a lateral support system formed of

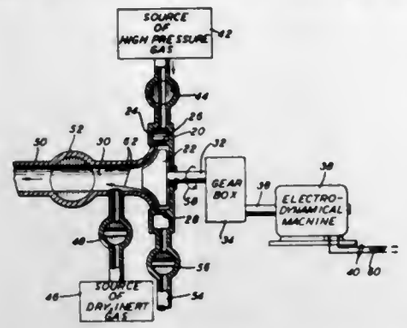
(a) a bottom lateral support comprising in combination

(1) a vertically disposed stud affixed to the bottom of said inner vessel and having depending therefrom at least three equally spaced extensions forming curved contacting inner vessel lands,

(2) a sheath surrounding the bottom portion of said stud, affixed to said radiation shield and having on its internal walls at least three curved and equally spaced contacting lands in the same plane as said inner vessel lands and alternating in position with said inner vessel lands,

(3) a spacer body of low thermal conductivity positioned to contact the surface of said lands, whereby said inner vessel and said radiation shield are maintained in relative alignment, and

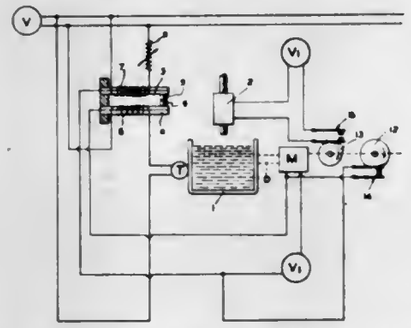
(4) at least three, low thermal conductivity bands equally spaced connecting said sheath and the internal wall of said outer vessel; and



(b) a top lateral support, comprising in combination

(1) connector means joining said radiation shield means with said neck section of said inner vessel, and

(2) at least three, low thermal conductivity bands equally spaced connecting said connector means and the internal wall of said outer vessel.



3,274,789
PROCESS FOR REMOVING CONGEALED IMPURITIES FROM A GAS EXPANDER
Harold C. Mitchell, Glen Rock, N.J., assignor to Air Reduction Company, Incorporated, New York, N.Y., a corporation of New York
Filed Mar. 26, 1965, Ser. No. 443,052
12 Claims. (Cl. 62—85)

3. The method of removing congealed matter from the interior of a gas engine operating normally as an expander, comprising the steps of operating the engine for a period of time as a compressor, and feeding a dry, inert gas through the engine to compress and warm the dry, inert gas, whereby the said dry, inert gas is enabled

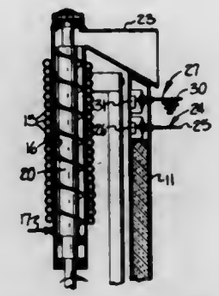
to melt the said congealed matter, entrain the melted material, and vent the entrained melted matter along with the exhaust stream of the compressed dry, inert gas.

3,274,790
TEMPERATURE SENSING CONTROL MEANS FOR ICE MAKING DEVICES
Jack B. Meister, Morristown, and Raymond J. Staten, Budd Lake, N.J., assignors to Integrated Electronics Corporation, Wharton, N.J., a corporation of New Jersey
Filed June 9, 1965, Ser. No. 462,560
11 Claims. (Cl. 62—135)

1. In an ice making device having a receptacle in which water is cyclically frozen into ice and ejected therefrom, means operable to cause ejection of said ice from said receptacle, and means for controlling cyclic operation of said device in response to the temperature of said ice, said controlling means comprising:

first and second temperature responsive movable members;

electric circuit means for controlling operation of said ejection means, said electric circuit means including cooperable movable electrical contacts each of whose spatial position is controlled by a respective one of said movable members;



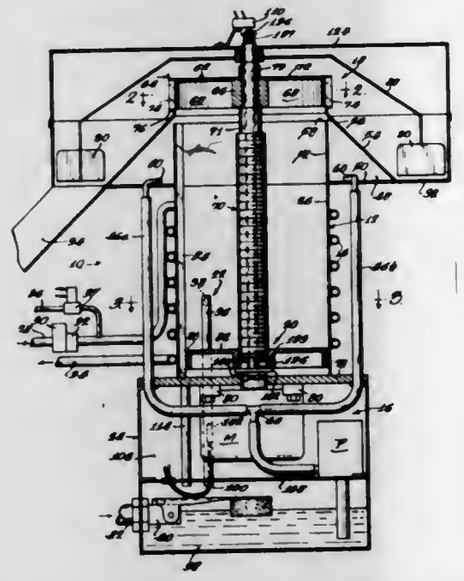
respective first and second heating means for and electrically isolated from said first and second movable members;

means for sensing the temperature of the ice in said receptacle and effective to control said first heating means to cause said first member to move to cause closure of said electrical contacts when the ice has reached a given temperature; operation of said ejection means being responsive to closure of each contacts.

3,274,791
CONTROL SYSTEM FOR ICE MACHINE
John H. Edmisten, 418 W. Main St., Boone, N.C.
Filed July 1, 1965, Ser. No. 468,895
6 Claims. (Cl. 62—137)

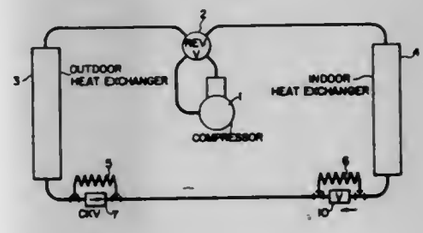
1. In an ice machine having a freezing surface, means for refrigerating the freezing surface for the formation of ice thereon, harvesting means mounted to engage ice upon relative movement between the same and the freezing surface for removing ice from the freezing surface in flake form, means for receiving and storing flake ice delivered from the harvesting means, and a control system effective to control the cycling of ice production in response to the quantity of ice in said storage means to produce ice as needed to replenish the quantity stored; the combination therewith of means for delaying the initiation of a cycle of ice production comprising:

ice receiving means disposed in the path of delivery of flake ice from the harvesting means to the storage



means for receiving and retaining a portion of the ice produced during a cycle of ice production until such retained ice is melted, and

means responsive to retention of ice by said receiving means and operatively connected to the control system for precluding the initiation of a cycle of ice production during retention of ice by said receiving means and for permitting the initiation of a cycle of ice production upon the melting of retained ice,

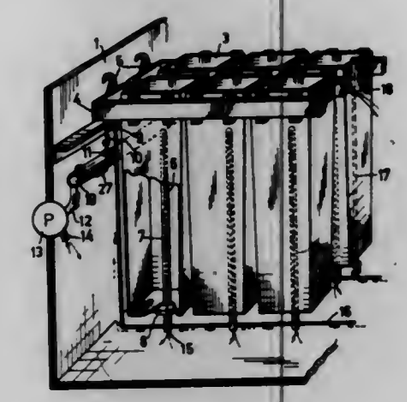


whereby damage to the ice machine which would otherwise result from initiation of a cycle of ice production during an over-iced condition of the freezing surface is avoided.

3,274,792
ICEMAKER WITH PISTON-TYPE ICE REMOVER
Albert G. Weil, Walter A. Zeuschner, and Kenneth W. Zeuschner, all of Chicago, Ill., assignors to Remcor Products Company, Chicago, Ill., a corporation of Illinois
Filed Sept. 16, 1965, Ser. No. 487,710
11 Claims. (Cl. 62—138)

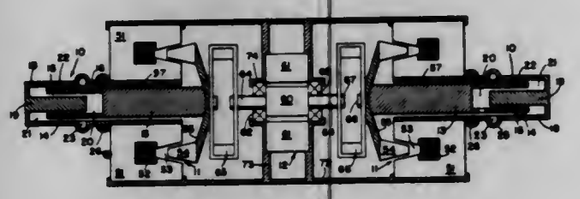
2. In an icemaker: a freezing plate defining an upwardly open freezing chamber adapted to have an ice slab formed on the inner surface thereof; means for flowing water downwardly over the inner surface of said freezing chamber; means for supplying refrigerant to said freezing plate to form ice thereon; ice breaker means including a crusher rotatably mounted at the upper end of said chamber; means for moving formed ice into the path of said crusher including lift plate means mounted within said chamber for movement from adjacent the lower end of said chamber to adjacent said crusher; common drive means for conjointly rotating said crusher and moving said lift plate means; and means responsive to formation of a slab of ice on said freezing plate for stopping the supply of refrigerant and starting operation of said drive means.

3,274,793
HEAT PUMP DEFROST SYSTEM
Richard M. Anderson and Robert A. Essig, Elyria, Ohio, assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Apr. 5, 1965, Ser. No. 445,370
3 Claims. (Cl. 62—151)



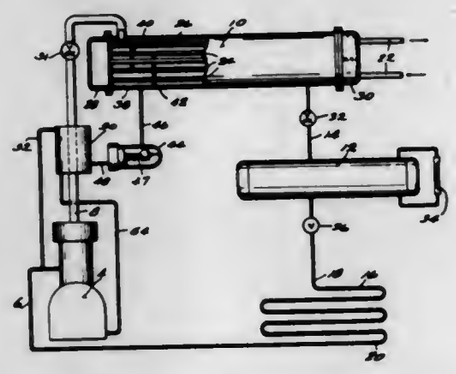
1. A heat pump system comprising, an indoor heat exchanger, an outdoor heat exchanger, means for restricting the flow of refrigerant between said exchangers, and a differential pressure responsive bypass check valve connected in parallel with said restriction means and having means adapted to have an open position together with a partly closed position and a fully closed position to be responsive to the flow of refrigerant between said exchangers in a direction to cool said outdoor heat exchanger to move said check valve to the open position and responsive to the flow of refrigerant under relatively low pressure between said exchanger in a direction to heat said outdoor exchanger to move said check valve to the partly closed position thereby partially bypassing said restriction to accelerate the loading and heating of said outdoor heat exchanger for defrosting purposes and to be responsive to the flow of refrigerant under relatively high pressure between said exchangers in the direction to heat said outdoor heat exchanger to thereby move said check valve to the fully closed position for continued operation and heating of said outdoor heat exchanger.

3,274,794
APPARATUS FOR PRODUCING ICE BLOCKS IN MOLDS
Eugen Wilbushewich, Rotelstrasse 61, Zurich, Switzerland
Filed June 22, 1965, Ser. No. 465,841
Claims priority, application Great Britain, Dec. 12, 1964, 50,699/64
11 Claims. (Cl. 62—349)



1. Apparatus for producing ice blocks in molds comprising a tank containing cooled brine, a battery of rows of ice molds in said tank, each mold having a base and a vertical axis, and each mold being arranged to be supported in said tank immersed in the brine, an internal finger associated with each mold and closed at an upper end and having a lower end in communication with the brine, the finger extending upwardly from the base of

each mold, a brine supply tube, a conduit connected to the lower ends of said fingers in each row of molds, a common brine pump connected to the brine supply tube, disconnectable coupling means connecting each of said conduits to the brine supply tube, each coupling means comprising a socket part in communication with said supply tube, and a tubular spigot part on the conduit

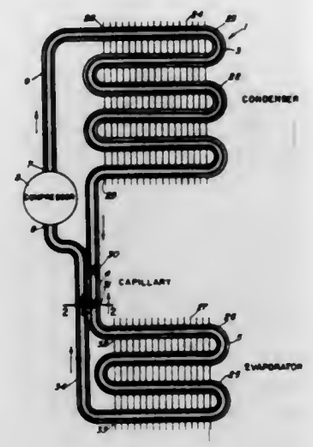


adapted removably to fit into said socket part, said socket part incorporating a spring loaded valve member adapted to close said socket part when a mold is removed from the tank for harvesting, and valve means in circuit with said conduits for selectively sucking off, and forcing into, said fingers, air cooled brine, and thawing water during successive air extraction, freezing and harvesting operations.

3,274,795
FLUID OPERATING APPARATUS
Arthur A. Fowle, Winchester, Theodore P. Heuchling, Concord, Allen Latham, Jr., Jamaica Plain, Charles A. Schulte, Lexington, and Richard E. Kronauer, Harvard, Mass., assignors to Arthur D. Little Inc., Cambridge, Mass., a corporation of Massachusetts
Filed Apr. 30, 1964, Ser. No. 363,740
27 Claims. (Cl. 62—403)

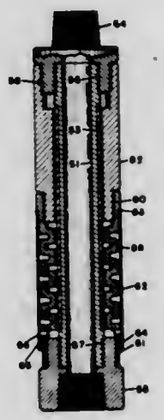
1. A rotating, linearly reciprocating fluid handling apparatus, comprising in combination
(a) a stationary fluid-tight enclosure;
(b) a piston having rotating fluid ports associated therewith and being capable of being reciprocated within said stationary enclosure to define therein a fluid chamber of variable volume;
(c) fluid inlet and outlet ports in said stationary enclosure;
(d) electromagnetic linear actuating means directly affixed to said piston and adapted to impart linear reciprocating motion to said piston and to interact with the pressure forces of said fluid in said fluid chamber;
(e) an elastic member connected to said linear actuating means and adapted to provide said piston and said linear actuating means those acceleration forces required for reciprocating said piston which are not provided by fluid in said fluid chamber and said linear actuating means and further to provide whatever average force is required to counterbalance any average difference between the forces delivered by said linear actuating means and those absorbed from said fluid; and
(f) rotary actuating means adapted to rotate said rotating fluid ports relative to said fluid inlet and outlet ports, said linear and said rotary actuating means being synchronized whereby the reciprocating motion of said piston and the relative rotary motion of said rotating ports control the flow of fluid in and out of said fluid chamber.

3,274,796
REFRIGERATION SYSTEM WITH LUBE OIL SEPARATION MEANS
Erich J. Kocher and Joseph N. Long, both of Milwaukee, Wis., assignors to Vilter Manufacturing Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed Sept. 23, 1965, Ser. No. 489,611
4 Claims. (Cl. 62—473)



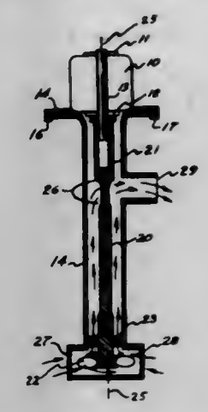
1. In a refrigeration system including an oil lubricated compressor having a hot gas discharge conduit communicating with a condenser, means associated with the inlet to the condenser in communication with the hot gas discharge conduit for initially separating oil from the refrigerant employed in the system, an extraction chamber surrounding a closed portion of said hot gas discharge conduit between the compressor and said initial oil separating means, whereby said discharge conduit provides a heating element for said extraction chamber, and a conduit communicating between said initial oil separating means and said chamber for conducting the initially separated oil having residue refrigerant therein to said chamber, whereby said heating element provides heat for extracting residue refrigerant from the oil, said chamber also having a conduit communicating therewith for discharging refrigerant therefrom and a separate conduit communicating therewith for discharging oil therefrom.

3,274,797
HEAT EXCHANGER INCLUDING A CAPILLARY TUBE SECTION
Richard W. Kritzer, Chicago, Ill., assignor to Peerless of America, Incorporated, Chicago, Ill., a corporation of Illinois
Filed May 8, 1964, Ser. No. 365,905
12 Claims. (Cl. 62—511)



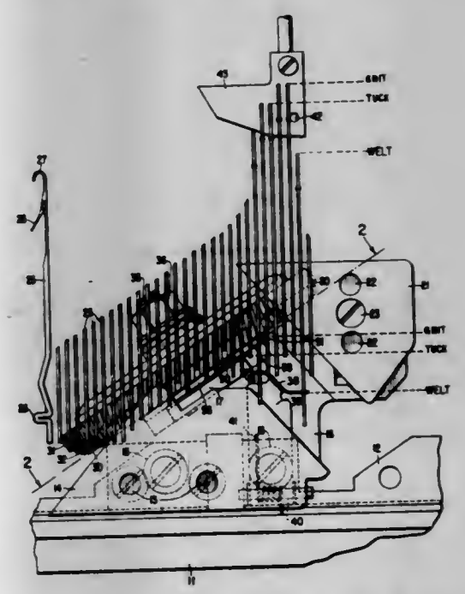
1. A heat exchanger element comprising
(a) a condenser section means,
(b) an evaporator section means, and
(c) a capillary tube section means,
(d) said first two mentioned means each including an elongated conduit having a plurality of adjacent passageways extending lengthwise thereof for simultaneously feeding refrigerant in the same direction through all of said passageways,

(e) said capillary tube section means being in fluid communication with said two first mentioned means and including an elongated conduit having a plurality of adjacent passageways extending lengthwise



thereof and operatively connected to each other in position to feed said refrigerant alternately in said one direction and in the opposite direction through adjacent ones of said last-mentioned passageways.

3,274,798
VIBRATION ISOLATOR
John H. Wiggins, Jr., Tulsa, Okla., assignor, by mesne assignments, to Esso Production Research Company, a corporation of Delaware
Filed June 17, 1964, Ser. No. 375,861
7 Claims. (Cl. 64—1)

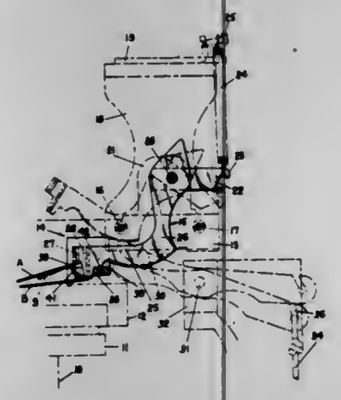


1. A vibration isolator for a rotary drilling column which comprises inner and outer substantially concentric tubular members, the inside diameter of said outer member being at least 10 percent and no more than 20 percent greater than the outside diameter of said inner member, said inner member having a Young's modulus no greater than 15×10^6 p.s.i. and a tensile strength of at least 50,000 p.s.i., said outer member including at least one bellows-like convolution to provide a longitudinal spring constant no more than fifty percent as great as the longitudinal spring constant of said inner member, bearing means within the annular space between said inner and outer members for preventing excessive friction wear, and coupling means at opposite ends of said tubular members for rigid connection in a rotary drill column.

3,274,799
DRIVE-SHAFT ARRANGEMENT FOR A FLUID CIRCULATING DEVICE
Eugene G. Danner, 9122 71st Road, Forest Hills, N.Y.
Filed Mar. 30, 1964, Ser. No. 355,547
3 Claims. (Cl. 64—4)

1. A fluid circulating device including; a tubular housing; a motor having a drive shaft mounted in one end of said housing;
bearing means secured adjacent the other end of said housing;
the axis of said drive shaft and bearing means subject to misalignment,
a substantially rigid shaft rotatably supported near one end by said bearing means and non-rotatably connected at the other end with said drive shaft,
said shaft having a portion of reduced dimension for forming a flexible section, the breadth of said section substantially equal to the diameter of said shaft, and the thickness of said section substantially less than said breadth.

3,274,800
PATTERN CONTROLLING MECHANISM FOR KNITTING MACHINES
Lester Mishcon, Miami Beach, Fla., and Alvin Agulnek, Brooklyn, N.Y., assignors to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Jan. 4, 1965, Ser. No. 423,182
9 Claims. (Cl. 66—50)



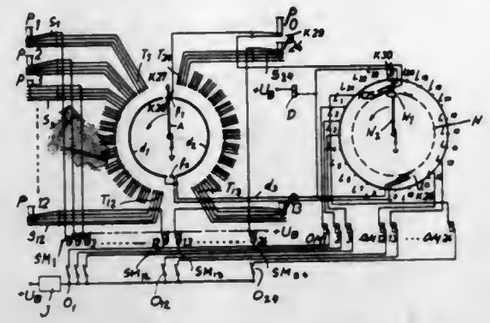
1. In a pattern wheel supporting section block for a circular knitting machine including a fork adapted to accommodate a bearing stud on which a pattern wheel is journaled, means for at will rendering the pattern wheel

ineffective comprising a retractable cam blade formed with a shank, said fork being formed with a slot extending substantially radially of said pattern wheel, means slidably constraining said cam blade shank in said slot for movement substantially radially of said pattern wheel and with said cam blade disposed beneath the level of said pattern wheel.

3,274,801
YARN FEEDING MEANS

Donat H. Fregeolle, Cumberland, R.I., assignor to The Banner Company, Central Falls, R.I., a corporation of Rhode Island

Filed May 28, 1964, Ser. No. 370,910
1 Claim. (Cl. 66—125)

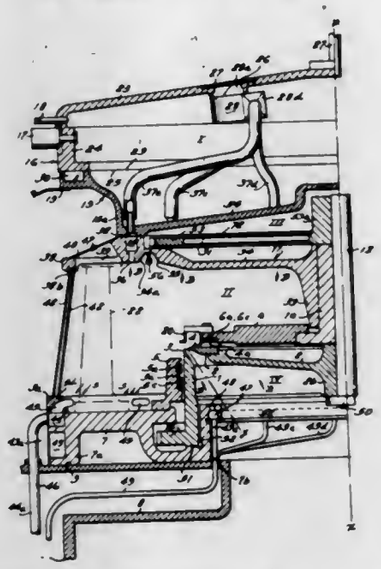


For a knitting machine having a needle cylinder and needles slidably mounted therein, a mouthpiece and a plurality of selectively movable yarn feed levers adapted to cooperate therewith to feed yarn to said needles, said mouthpiece having an inner vertical face with a vertically disposed slot extending partially therethrough, said mouthpiece further including a centrally disposed lever engaging horizontal surface extending from said inner vertical face to the outer edge of said mouthpiece and including a generally rectangular open central portion, yarn camming edges forming the inner side of said open central portion with said edges being sloped angularly downward, extending laterally from each side of, and inclined toward said vertically disposed slot, said yarn feed levers having means to feed two separate yarns when selectively moved to feeding position, said means including dual yarn guiding channels a first of which is adapted to project into said rectangular open central portion where its yarn is adapted to be guided by said yarn camming edges into the lower portion of said slot from which it is adapted to be fed to said needles, and the second being in advance of and vertically spaced from said first guiding channel is adapted to feed its yarn at the level of said horizontal surface.

3,274,802
THREAD SELECTOR APPARATUS

Richard Schmidt, Stuttgart-Vaihingen, and Hans Joachim Stock, Freiburg im Breisgau, Germany, assignors to Franz Morat G.m.b.H., Stuttgart-Vaihingen, Germany

Filed Oct. 15, 1964, Ser. No. 404,116
Claims priority, application Germany, Oct. 16, 1963, M 58,568
19 Claims. (Cl. 66—138)



1. Thread selector apparatus for a knitting machine having a series of knitting stations, comprising, in combination, a series of selector magnets at said knitting stations, respectively; a series of operating magnets at said knitting stations, respectively; and a series of thread guide means at said knitting stations, respectively, each thread guide means including a plurality of thread guides for different threads, and being movable by the respective selector magnet between a plurality of positions in which different thread guides are operable by the respective operating magnet to place the thread thereof in a knitting position.

3,274,803
ENCLOSED CIRCULAR KNITTING MACHINE

Richard Schmidt, Stuttgart-Vaihingen, Germany, assignor to Franz Morat G.m.b.H., Stuttgart-Vaihingen, Germany

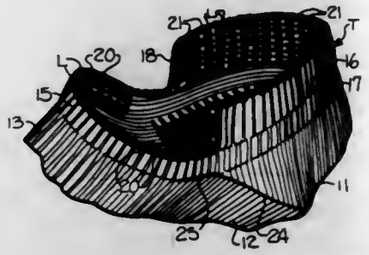
Filed Sept. 11, 1964, Ser. No. 395,750
Claims priority, application Germany, Sept. 12, 1963, M 58,175
20 Claims. (Cl. 66—168)

1. A knitting machine comprising, in combination, supporting means; a pair of needle carrier means movably supported on said supporting means and having cooperating portions for performing knitting operations; and housing means for said needle carrier means carried by said supporting means and including at least one transparent wall located opposite said cooperating portions for observation of said portions and of knitting operations.

3,274,804
FOOTLET TYPE SOCK AND METHOD

James L. Thorneburg, Lewis L. Thorneburg, and James D. Keever, all of Statesville, N.C., assignors to Thorneburg Hosiery Mills, Inc., Statesville, N.C., a corporation of North Carolina

Filed May 22, 1964, Ser. No. 369,438
15 Claims. (Cl. 66—171)



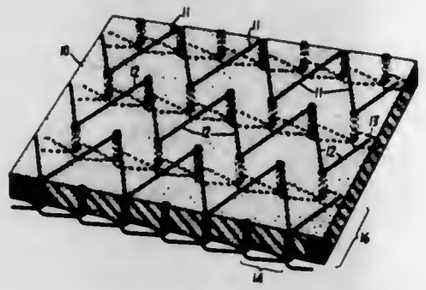
1. A knit footlet type sock adapted to be worn inside of a low-cut shoe and to be substantially covered thereby, said footlet sock comprising

(a) a foot portion including a toe portion, a heel embracing portion, and a seamless tubular portion connecting said toe and heel portions, the lower half of said seamless tubular portion defining a sole portion and the upper half defining an instep portion,

(b) an ankle portion comprising a few complete courses connected to said instep portion and said heel embracing portion and extending upwardly therefrom,

(c) a support tab connected at one end to the portion of the upper course of the ankle portion positioned above said heel embracing portion, said support tab comprising a plurality of partial courses, and

(d) a plurality of rounds of an elastic strand inlaid in the stitch loops of the portion of the upper course of

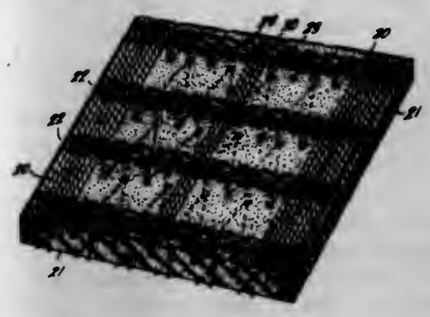


the ankle portion positioned above said instep portion, said rounds of elastic strand also being inlaid in the stitch loops of the terminal partial course of said support tab and forming an elastic selvage edge defining an opening in said footlet sock adapted to receive the foot of the wearer therethrough, sad elastic selvage edge serving to roll said support tab down upon itself and over the upper edge of the heel portion of the shoe to prevent the rear portion of the footlet from sliding downwardly into the shoe.

3,274,805
FABRIC AND METHOD

Daniel Duhl, New Hyde Park, N.Y., assignor to Indian Head Mills, Inc., New York, N.Y., a corporation of Massachusetts

Filed Aug. 9, 1963, Ser. No. 301,059
5 Claims. (Cl. 66—192)



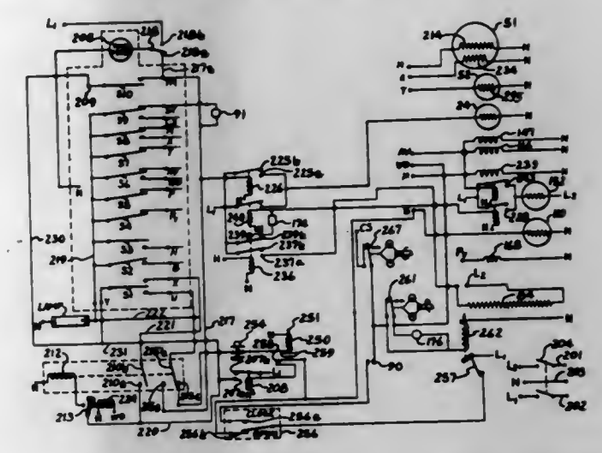
1. A fabric comprising an elastomeric foam sheet encased in a warp knitted fabric, the fabric comprising yarns which alternately form the loops of adjacent loop chains on one surface of the sheet, pierce the sheet, and form interconnected courses on the other surface of the sheet, the loops of the loop chains being moved up onto each other as a result of the knitting of the fabric through the foam sheet while the sheet is in a stretched condition.

3,274,806
FABRIC CONTAINING ELASTOMERIC FILLER AND METHOD

Daniel Duhl, New Hyde Park, N.Y., assignor to Indian Head Mills, Inc., New York, N.Y., a corporation of Massachusetts

Filed Apr. 20, 1964, Ser. No. 361,619
10 Claims. (Cl. 66—192)

1. A fabric having a limited stretch in at least a longitudinal direction comprising an elastomeric foam sheet, a facing for at least one surface thereof and an extension-limiting yarn system, the yarn system being comprised of warp knitted stitches formed into parallel courses of threads which alternately form the loops of adjacent courses of loop chains on one surface of the fabric, which pierce the facing and sheet, and which then form courses on the other surface of the sheet to secure the facing to



the sheet, the courses of loop chains being oriented in the longitudinal direction.

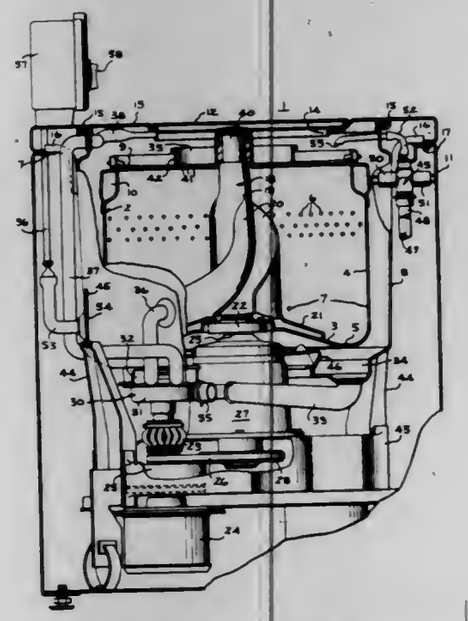
3,274,807
DRY CLEANING MACHINE

Clifford F. Czech, Ripon, Wis., assignor to McGraw-Edison Company, Ripon, Wis., a corporation of Delaware

Original application July 31, 1963, Ser. No. 298,899. Divided and this application June 30, 1965, Ser. No. 482,003
3 Claims. (Cl. 68—12)

2. In a clothes washing machine of the type using organic washing fluids having a rotatable clothes basket, drive means for basket rotation, safety control means comprising, in combination, a timer means for sequentially controlling said machine through a sequence of washing operations, including rotation of said clothes basket by said drive means for predetermined periods of time, power switch means for energizing and deenergizing said machine, including a switch adapted to be manually reset to a closed position and a solenoid adapted to open said switch upon energization of said solenoid, a normally closed switch means operable for energizing said solenoid and including a mechanical connection for opening said normally closed switch means upon rotation of said clothes basket by said drive means, said timer energizing said normally closed switch means for a selected time interval in said predetermined periods of time to energize said switch solenoid and deenergize said machine upon failure of basket rotation during said selected time interval.

3,274,808
BASKET FOR AUTOMATIC WASHING MACHINE

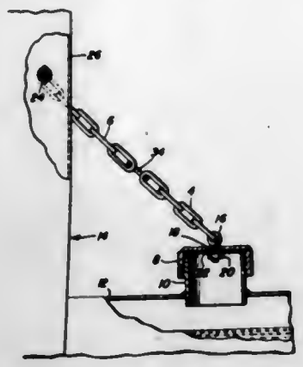


Everett D. Morey, Louisville, Ky., assignor to General Electric Company, a corporation of New York

Filed Sept. 28, 1964, Ser. No. 399,524
3 Claims. (Cl. 68—23)

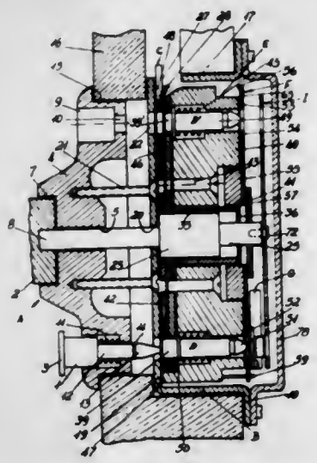
1. A fabric washing machine including:

(a) an imperforate tub to receive liquid,



(b) a basket rotatably mounted within said tub to receive fabrics to be washed in the liquid,
(c) liquid supply means adapted to fill said basket and said tub with liquid to a predetermined normal level,
(d) flexing means to cause relative motion between the liquid and the fabrics for washing the fabrics,
(e) drive means connected to said basket for rotating said basket to centrifugally extract liquid from the fabrics at the end of the washing operation, and
(f) pump means connected to said tub and effective to remove liquid from said tub and discharge it back into said basket at a first predetermined low rate of flow during the washing operation, said pump means being effective to remove liquid from said tub and

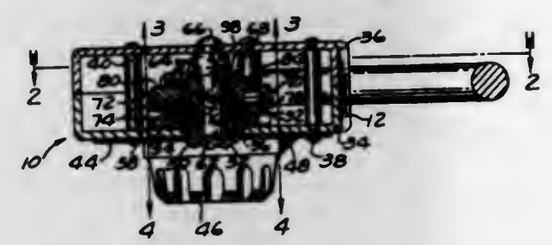
discharge it to drain at a second predetermined high rate of flow during centrifugal extraction,
(g) said basket having a first plurality of openings in the lower portion thereof of a total area sufficient only to pass said first predetermined rate of flow so that heavy soil removed from the fabrics is discharged from said basket during the washing operation,
(h) said basket having a second plurality of openings therein of a total area sufficient to pass said second predetermined rate of flow, said second plurality of openings being positioned near the normal level of liquid in said tub and said basket for removing liquid from said basket during centrifugal extraction.



3,274,809
FUEL TANK CAP LOCK
Lawrence S. Kozlowski, Kawkawlin, Mich., assignor of twenty-five percent each to Edward Skipstead, Victor De Rosier, and Martin B. Legatz
Filed Sept. 1, 1964, Ser. No. 393,679
2 Claims. (Cl. 70—163)

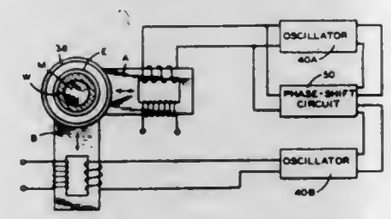
1. In combination with a vehicle of the type including a fuel tank having one wall thereof provided with a fill opening, a filler neck secured to said one wall about said opening and projecting outwardly of said one wall, a closure cap removably threadedly secured on the outer end of and closing said filler neck, a link chain assembly having one end anchored to said cap against rotation relative thereto, said vehicle including a portion spaced outwardly of said one wall of said tank, the other end of said link chain assembly being secured to said vehicle portion against rotation relative thereto with said link chain assembly extending away from said one wall toward said vehicle portion in a reasonably taut condition, said link chain assembly including a pair of opposite end link chain sections, and lockable fastener means remov-

ably securing adjacent ends of said sections together against more than limited rotation relative to each other.



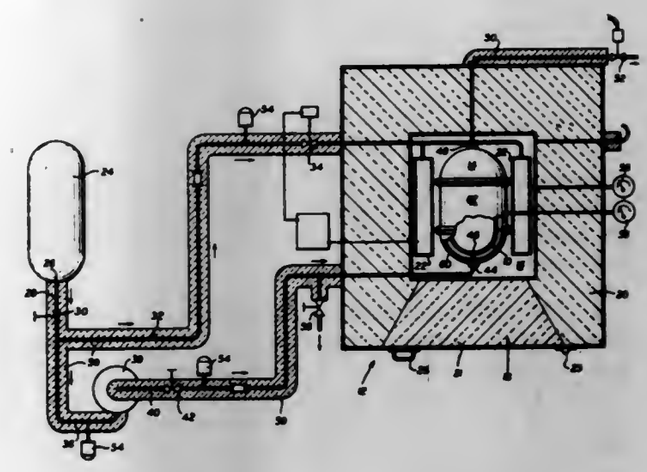
3,274,810
PUZZLE LOCK
Felix Pedro Traversa and Armando Marcos Traversa, both of Boedo 769, Buenos Aires, Argentina
Filed May 5, 1964, Ser. No. 365,006
11 Claims. (Cl. 70—288)

1. A lock for use in combination with a separate door latch, said lock comprising a control disc formed with a plurality of openings therethrough, said control disc being mounted on the inside of a door turnably about a turning axis and being operatively connected to said door latch; turning means having an operating portion at the outside of the door and being spaced from said operating portion connected to said control disc for turning the latter between a first position in which said latch connected thereto is in a locking position and a second position in which said latch is in an unlocked position; a plurality of co-operator members mounted on the inside of said door movable between a locking position in which end portions of said cooperator members are respectively located in said openings of said control disc so as to prevent turning of the latter, and a releasing position; biasing means operatively connected to said cooperator members and biased to yieldably maintain the latter in said locking position; a first plurality of movable operating members having operating portions outside of the door and being respectively coordinated with said cooperator members for moving, when respectively actuated, the co-operator member respectively coordinated therewith from said locking to said releasing position; a plurality of locking means respectively cooperating with said co-operator members for holding the latter in said releasing position; a second plurality of movable operating members having operating portions outside said door; and restoring means cooperating with and actuated by any of said second plurality of



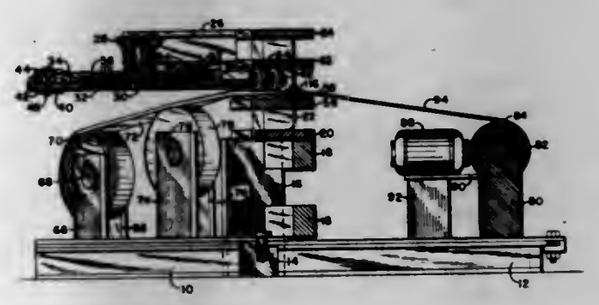
operating members for disengaging said locking means from said cooperator members so that the latter will return to said locking position, whereby said control disc may be turned to move said latch to said unlocked position only when all of said first plurality of operating members and none of said second plurality of operating members are actuated.

3,274,811
COMBINATION LOCK APPARATUS AND SLIP COUPLING THEREFOR
Paul J. Ethington, 1418 Washington Blvd., Birmingham, Mich.
Filed Sept. 26, 1963, Ser. No. 311,860
9 Claims. (Cl. 70—301)



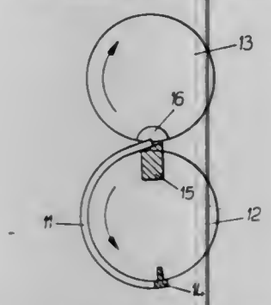
1. A slip coupling comprising a pair of combination lock code elements each of which is of a substantially disc shape having a pair of opposite faces and a code pin projecting from one of said faces, said code elements being arranged in face-to-face engagement so that the pins thereon project in opposite directions therefrom, and a support and retainer element arranged in a supporting relation with said code elements for rotatable movement therewith as a unit, said code elements being supported on said retainer element so that the code elements are rotatable with respect to each other in response to the application of forces to the pins thereon directed so that oppositely directed torques are applied to said code elements.

3,274,812
METHOD AND APPARATUS FOR VIBRATORY SQUEEZE-FORMING OF METALS
Sidley O. Evans, Beaver Falls, Pa., assignor to The Babcock & Wilcox Company, New York, N.Y., a corporation of New Jersey
Filed July 1, 1964, Ser. No. 379,497
10 Claims. (Cl. 72—60)



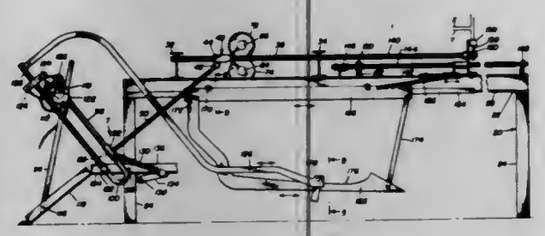
1. A process for squeeze-forming metals which includes forcing a substantially solid state metal member through a die opening by applying axial pressure to said member to perform work thereon whereby a reduction in the cross-section of said member is effected, simultaneously applying transverse vibratory energy to said member from a plurality of vibrating devices which are angularly disposed with respect to each other, and maintaining said vibrating devices out of time phase with each other so as to impart an orbicular vibrational movement to said member.

3,274,813
GENERALIZED STRETCH FORMING
Benjamin J. Aleck, Jackson Heights, N.Y., assignor to Arde-Portland, Inc., South Portland, Maine, a corporation of Maine
Original application Mar. 28, 1962, Ser. No. 183,149, now Patent No. 3,197,851, dated Aug. 3, 1965. Divided and this application July 8, 1965, Ser. No. 470,367
2 Claims. (Cl. 72—62)



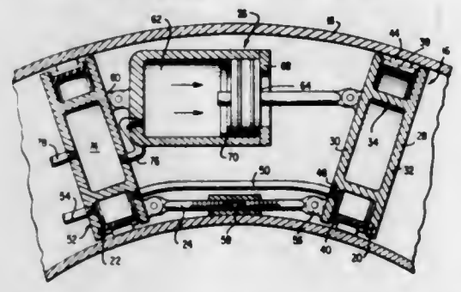
1. Apparatus for forming high tensile strength pressure vessels, comprising a die adapted to receive a vessel blank and having at least a portion of the interior of the size and shape of said vessel, said die having two openings therein, a container, refrigerant in said container, a pump having an inlet and an outlet, a first conduit connecting said container of refrigerant to said pump inlet, a second conduit extending from said pump outlet through one of said openings in said die and adapted to be connected in communication with the interior of said vessel blank for supplying said refrigerant under pressure to the interior thereof to cool and stretch said vessel blank to substantially conform to the interior of said die, and third conduit means for venting the space between said die and said vessel blank.

3,274,814
ROLLING MILL
Elmer D. Dilling, Las Vegas, Nev., assignor to Titanium Metals Corporation of America, New York, N.Y., a corporation of Delaware
Filed May 25, 1964, Ser. No. 369,808
13 Claims. (Cl. 72—74)



1. A method for reducing the thickness and increasing the width and length of a metal strip which comprises; passing said metal strip over a platen and working said strip to reduce its thickness by pressing against said platen with a thin edge working roller which is moved in successive, adjacent paths diagonally across said strip at an angle to the transverse axis thereof.

3,274,815
METHOD AND APPARATUS FOR MAKING ANTI-FRICTION BEARINGS WITH LOCKING CAMS
Erich Roemer, Kapellenstrasse 60, Wiesbaden 62, Germany
Filed Jan. 25, 1965, Ser. No. 427,782
Claims priority, application Germany, Feb. 1, 1964, G 39,759
7 Claims. (Cl. 72—152)

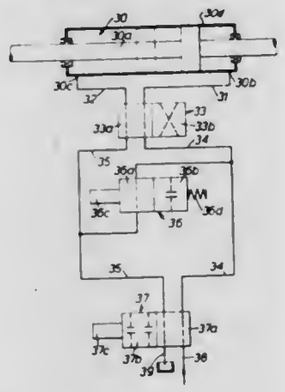


1. The method of making an antifriction bearing with an outwardly displaced segment in its wall at the parting line, consisting in passing the blank between pressure rolls which apply pressures to opposite sides of the blank, incising the wall of the blank at the parting line thereof with at least one knife and displacing outward the incised wall portion into a recess in one of said pressure rolls.

3,274,816
MACHINE FOR TAPERING TUBING
Richard Anthony Held, Rte. 1, Box 90–B3, Ramona, Calif.
Filed Sept. 20, 1963, Ser. No. 310,417
4 Claims. (Cl. 72—189)

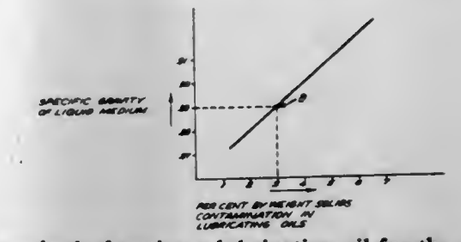
1. A machine for changing a uniform outside diameter stock such as a rod or tubing to stock having a taper on the outer surface, said machine comprising in combination:
(A) a frame forming
(1) an elongated guide;
(B) a carriage guided by and movable longitudinally of the guide;
(C) die means carried by the carriage, said die means forming swaging surfaces which, in conjunction, are circular in cross section, which decrease in width constantly for tapering stock, said die means including:
(1) a pair of rollers, each roller having on the periphery thereof, a swaging surface arranged allochirally, said surfaces being semicircular and gradually decreasing in depth radially, said surfaces of the rollers confronting one another when oscillatory movements are imparted to the rollers;
(D) means for reciprocating the carriage along the guide and for simultaneously effecting oscillatory movements in opposite directions to the rollers;
(E) movable means for progressively feeding stock longitudinally thereof between the swaging surfaces of the rollers;
(F) means synchronized with and movable with the movement of the movable stock feeding means and forming a template;
(G) and means governed by the movement of the template for varying the degree of oscillating movements imparted to the roller by varying the length of reciprocating movements imparted to the means (D) for reciprocating the carriage.

3,274,817
INTERNAL PIPE BENDER
James H. Anderson, 1615 Hillock Lane, York, Pa.
Filed Apr. 15, 1964, Ser. No. 359,902
19 Claims. (Cl. 72—298)



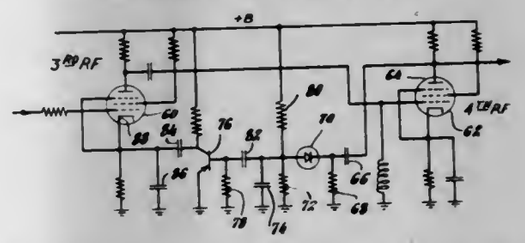
1. An apparatus for bending a tubular structure comprising gripping members positioned within a tubular structure in axially spaced relation to one another, means to actuate said gripping members to engage said tubular structure, a second means interposed between and connecting said gripping members, said second means being operative to effect angular displacement between said gripping members or stretching a portion of the wall of said tubular structure to effect a bend therein.

3,274,818
APPARATUS FOR FORMING ARTICLES
Henry G. Henrickson, Oakland, Calif., assignor to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware
Filed Nov. 4, 1963, Ser. No. 321,170
9 Claims. (Cl. 72—336)



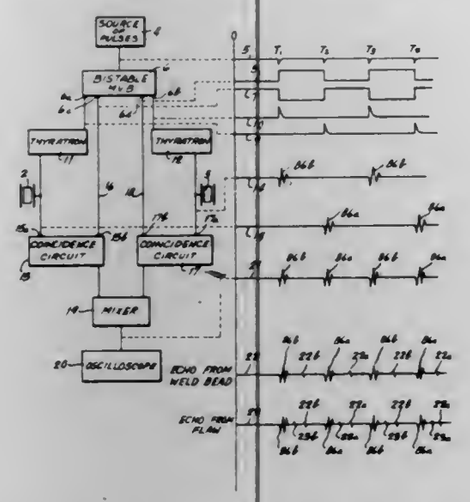
1. A die apparatus for forming cup-shaped articles comprising a stationary die assembly and a movable die assembly reciprocable toward and away from said stationary die assembly; said stationary die assembly including a reversible trimming ring having identical upper and lower article lip-forming surfaces and trimming edges; a mandrel mounted upon a surface of said trimming ring; said mandrel further comprising an article wall-forming portion located in spaced relationship to said trimming ring and an article bottom-forming surface which merges with said article wall-forming portion; means removably securing said mandrel and said trimming ring in said stationary die assembly; a first draw ring surrounding said mandrel; means biasing said first draw ring toward said movable die assembly; a blank-cutting member having a blank-cutting edge surrounding said first draw ring; said movable die assembly including a sleeve-like member provided with article wall and bottom-forming means which are cooperatively associated with the wall and bottom-forming portions of said mandrel and a second draw ring member surrounding said article wall and bottom-forming means of said sleeve-like member and aligned with said first draw ring member; said second draw ring member having an outer blank-cutting edge adapted to cooperate with the blank-cutting edge of said blank-cutting member during the initial movement of said movable die assembly and an inner trimming edge; means biasing said wall and bottom-forming means toward said stationary die assembly and relative to said second draw ring; said wall and bottom-forming means of said sleeve-like member being of such length that when biased by said biasing means the lowermost edge thereof will be in substantially the same plane as said inner trimming edge of said second draw ring whereby upon the bottoming of said movable die assembly with respect to said stationary die assembly the said inner trimming edge of said second draw ring member will move past the lowermost edge of said sleeve-like member and a trimming edge of said reversible trimming ring so as to trim the lip of said cup-shaped article.

3,274,819
FORGING PRESSES
Keith Knowles, Sheffield, England, assignor to The British Iron and Steel Research Association
Filed Apr. 4, 1963, Ser. No. 270,705
Claims priority, application Great Britain, Apr. 4, 1962, 12,840/62
4 Claims. (Cl. 72—421)



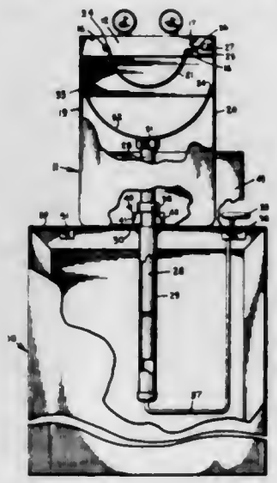
1. A workpiece manipulator for a forging press, comprising a carriage (**9, 10**), carriage drive means (**22–23**) for continuously driving said carriage during a forging pass, a peel (**12**) mounted on said carriage, and peel drive means (**30–39**) for driving said peel longitudinally relative to said carriage, said peel drive means comprising a double-acting piston-and-cylinder assembly (**30**) one element (**30***a*) of which is connected to said peel and the other of which is connected to said carriage and comprising valve means (**33, 36, 37**) operable in a first state in which fluid supplied to both ends of the cylinder for equal and opposite drive forces on the piston whereby said piston effectively floats within said cylinder to permit, during a squeeze, relative movement of said peel and said carriage from a datum position, and operable in a second state in which fluid is supplied to one end of the cylinder and is exhausted from the other end thereof to return, between squeezes, said peel and said carriage to said datum position.

3,274,820
TEST FOR ENGINE OIL CONTAMINATION
Julius M. Komarmy, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 23, 1963, Ser. No. 332,356
3 Claims. (Cl. 73—61)



1. A method of testing a lubricating oil for the presence of solids contamination in excess of a predetermined degree of contamination which warrants replacement of said oil, said method comprising the steps of placing a droplet of the contaminated lubricating oil to be tested into a liquid medium, said liquid medium being substantially immiscible with said oil and having a specific gravity such that said droplet will float in said liquid medium when the degree of solids contamination of said lubricating oil is not greater than said predetermined degree of contamination, but said droplet will sink in said liquid medium when the solids contamination content of said droplet exceeds said predetermined degree of contamination, the sinking of said droplet in said liquid medium indicating that said oil is sufficiently contaminated to warrant replacement, and observing the capacity of said oil to sink in said liquid medium.

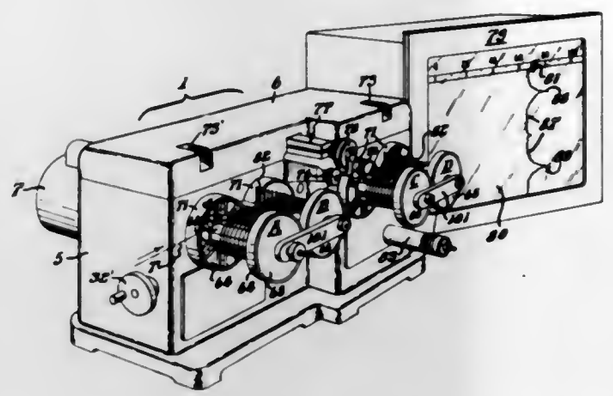
3,274,821
ULTRASONIC TESTING APPARATUS HAVING IMPROVED RESOLUTION
Frederick Gordon Weighart, Brookfield, Conn., assignor to Automation Industries, Incorporated, El Segundo, Calif., a corporation of California
Filed Oct. 24, 1962, Ser. No. 232,766
2 Claims. (Cl. 73—67.8)



2. An ultrasonic inspection system of a class described for ultrasonically inspecting a workpiece, said system including the combination of
transducer means for transmitting pulses of ultrasonic energy through an entrant surface and into the workpiece, said transducer means being effective to produce echo signals in excess of a predetermined level from said entrant surface and to produce echo signals corresponding to echoes reflected from discontinuities in said workpiece, said echoes from said discontinuities being less than said level,
an amplifier having an input and output, said input being coupled to the transducer means, said amplifier being effective to amplify the echo signals and provide an amplified signal on said output, said amplifier means tending to ring when the signal is in the region of said level,
feedback means coupled from the output back to the input, said feedback means including amplitude responsive means and being effective to decrease the gain of said amplifier whenever the echo signals are in the region of said predetermined level.

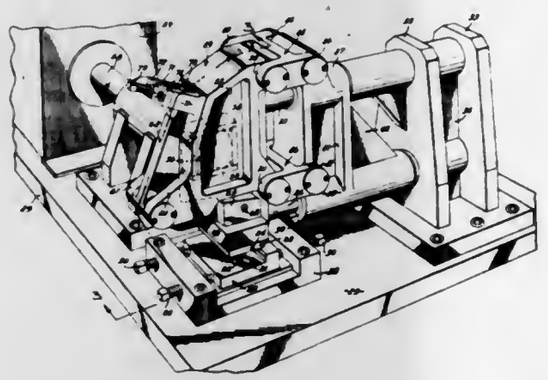
3,274,822
APPARATUS FOR ULTRASONIC TESTING
Andrew Stanya, South Euclid, Ohio, assignor to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey
Filed Feb. 19, 1963, Ser. No. 259,595
2 Claims. (Cl. 73—67.9)

1. Apparatus for ultrasonic echo testing of a body having a rib on a surface thereof, comprising:
(a) a first transducer in operative relation with the body on one side of the rib for directing a pulsed beam of ultrasonic waves through the body toward the rib and for receiving reflected pulses from discontinuities in the body or from the opposite side of the rib;
(b) a second transducer aligned with said first transducer in operative relation with the body on the opposite side of the rib for directing a second pulsed beam of ultrasonic waves through the body toward the rib from said opposite side and for receiving reflected pulses from discontinuities in the body or from said one side of the rib;
(c) indicating means responsive to pulses received at said transducers;
(d) means for alternately energizing the transducers at separated intervals, comprising:
(1) a bistable circuit having a pair of complementary pulse output terminals such that pulses are generated alternately at the terminals;
(2) two drivers, one for each of the transducers; and
(3) two connections from said pair of complementary pulse output terminals to said drivers, so that the transducers are alternately energized by the drivers at separated intervals determined by the spacing of the pulses generated by the bistable circuit;
(e) blocking means effective upon the energization of each transducer and until the energization of the other transducer to prevent response of the said indicating means to pulses received at the other transducer, comprising:
(1) a pair of complementary square wave output terminals forming a part of said bistable circuit and generating alternate square wave signals in synchronism with said alternate pulses generated by said bistable circuit; and
(2) two coincidence circuits each having two inputs and an output, one input of each coincidence circuit being connected to one of the two transducers, and the other input of each coincidence circuit being connected to one of the square wave output terminals of the bistable circuit, so that upon energization of one transducer the transmission of pulses from the coincidence circuit connected to the other transducer is blocked until energization of said other transducer.



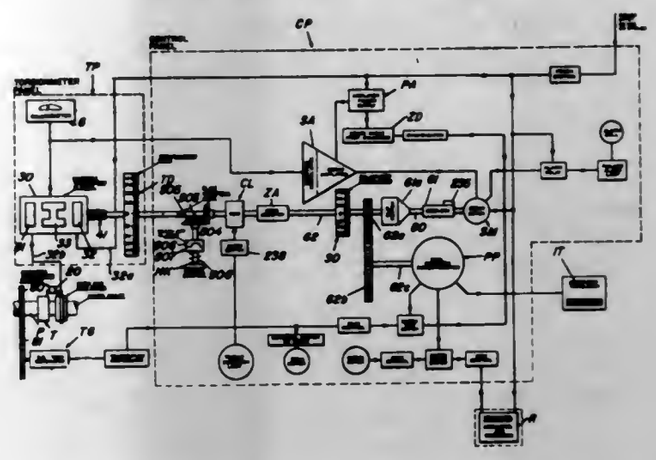
3,274,823
COMPRESSION TEST GAGE FOR JOURNAL BOX LUBRICATING PADS
Thomas W. Potter, Chicago, Ill., assignor to Journal Box Servicing Corporation, Indianapolis, Ind., a corporation of Indiana
Filed May 7, 1964, Ser. No. 365,771
8 Claims. (Cl. 73—94)

1. A device for gaging uniform length resiliency of a journal lubricating pad to be carried in a journal box, comprising
a simulated journal side having separate end to end arcuate surfaces normally in alignment to form an overall surface matching that of the journal side simulated;
means carrying said sections to be individually shiftable transversely of the axis of their curvature;
an arcuate pan having a curvature matching that of a journal box floor;
means shifting said pan toward and away from said sections;
stops limiting travel of said sections toward and away from said pan;
electric circuit means including a source of electrical energy;
a plurality of switches, one for each of said journal sections and actuated by a predetermined distance of travel of the sections in each of two directions;
a signal in said circuit means energized only when all of said switches are actuated by common travel of the sections in one direction as determined by a lubricating pad being held against all of those sections upon said pan being spaced a predetermined distance from the sections; and
a second signal in said circuit means energized when one or more of said switches are reversely actuated upon failure of one or more of those sections being shifted by said pad.



3,274,824
METHOD AND APPARATUS FOR TENSILE TESTING
Robert H. Lawson, Pawtucket, R.I., and John B. Lawson, Wilbraham, Mass., assignors to Lawson Engineering Co., Pawtucket, R.I., a corporation of Rhode Island
Filed May 21, 1964, Ser. No. 369,124
28 Claims. (Cl. 73—95.5)

1. In apparatus for testing strands of material, the combination comprising revolvable means for delivering a strand of material, revolvable take-up means coacting with said delivery means for stretching said strand and operable to take up said strand as it is delivered, the effective girth of at least one of said revolvable means being expansible and contractible, said delivery and take-up means being operative to prevent said strand from slipping under the influence of the stretching effort, means

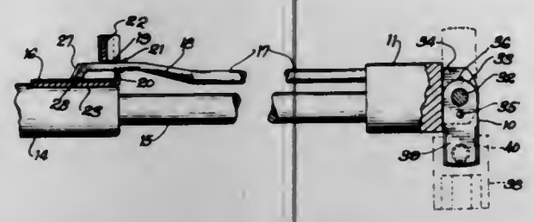


for varying the effective girth of said variable girth revolvable means so as to selectively vary the degree of stretch while the strand is being advanced from said delivery to said take-up means, and means for sensing and obtaining an indication of the effect of the stretching effort upon said strand.

3,274,825
APPARATUS FOR TESTING CONFIGURATED SIPES
John G. Wahlgren, Cuyahoga Falls, Ohio, assignor to Abex Corporation, a corporation of Delaware
Filed Feb. 4, 1964, Ser. No. 342,509
9 Claims. (Cl. 73—100)

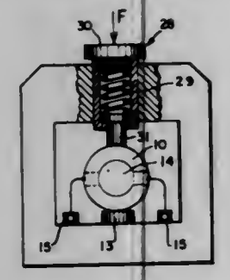
1. Apparatus for testing sipes comprising,
a base for receiving the sipes to be tested,
means on said base for fixedly mounting a sipe,
a carriage mounted on said base for multi-directional movements in a plane normal to said base and transverse to the length of said sipe,
a head mounted on said carriage above said sipe mounting means,
a tire simulator mounted on said head with a mating portion for engagement with sipe,
and means for cyclically moving said carriage and head toward said sipe mounting means to apply said tire simulator to said sipe and thereafter moving said carriage transversely of said sipe.

3,274,826
DIRECT READING SHAFT HORSEPOWER METER SYSTEMS
Maxwell Ingram, 15 Hamilton Ave., Dumont, N.J.
Filed Sept. 28, 1962, Ser. No. 226,866
14 Claims. (Cl. 73—136)



1. In a system for determining the horsepower output of a power rotated shaft, in combination, transducer means operatively connected with said power rotated shaft for developing a voltage directly related to torque in said shaft at any given instant during powered rotation thereof; a galvanometer electrically connected with said transducer means and receiving therefrom said voltage; electronic amplifier means, the input thereof being connected to the input terminals of said galvanometer for amplifying said voltage; a servo motor; a power circuit to said servo motor; said servo motor being electrically connected with and operatively controlled by said amplified voltage from said amplifier means; a driving connection between said servo motor and said transducer means for operation by said servo motor to restore said transducer means to a condition at which said galvanometer indicates a null; a tachometer generator coupled with and driven by said power rotated shaft for generating a D.C. voltage directly proportional to the rate of speed of rotation of said shaft; a potentiometer means including center tapped resistance and a contact member movable across said resistance; means operatively coupling said contact member with said servo motor for movement of said contact member from said center tap to a position of displacement on said resistance corresponding to the extent of operation of said servo motor; a circuit connecting said tachometer generator with said potentiometer for supplying said D.C. voltage directly proportional to the speed of rotation of said shaft to said potentiometer means; and said potentiometer means developing from said position of displacement of said movable contact member relating to torque and in combination with said D.C. voltage proportional to speed of rotation of said shaft, a single output voltage accurately reflecting the horsepower output of said power rotated shaft at any given instant during powered rotation thereof.

3,274,827
FORCE-TRANSMITTING MEASURING MECHANISM
Lee A. Sturtevant, Elmhurst, Ill.
(120 E. Lake St., Addison, Ill.)
Filed Oct. 4, 1963, Ser. No. 313,849
7 Claims. (Cl. 73—139)

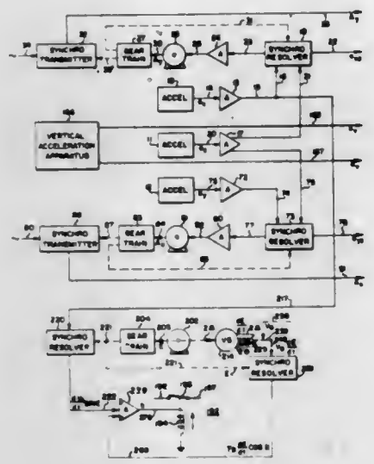


1. A force-transmitting mechanism comprising a force-applying member, a work-engaging member, a head member carrying said work-engaging member, a round torque measuring beam interposed between said force-applying member and said head, a pivotal mounting for said work-engaging member, said pivotal mounting being carried by said head, the pivotal mounting preventing distortion

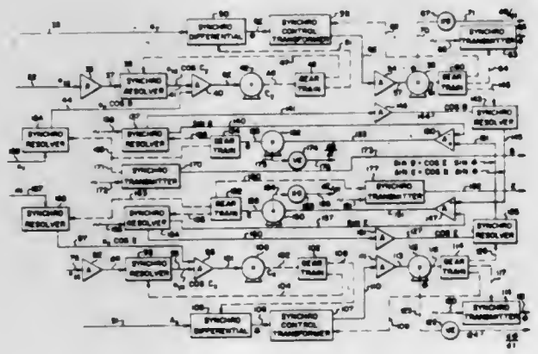
of said measuring beam by forces or force components received by said force-applying member in any plane other than at right angles to the axis of said work-engaging

member said pivotal mounting including a pivotal axis transversely disposed to said torque measuring beam and at right angles to the axis of said work-engaging member.

3,274,828
FORCE SENSOR
Charles F. Pulvari, 2014 Taylor St. SE., Washington, D.C.
Filed Aug. 27, 1963, Ser. No. 304,852
11 Claims. (Cl. 73—141)



3. A force sensor comprising, in combination: oscillator means including at least one solid-state element in the form of a resonator having an eigen frequency which varies when a force is applied thereto; means connected to said oscillator means for detecting a change in frequency when a force is applied to the element, said oscillator means and said solid-state element being arranged so that the element oscillates in the shear mode, and means for transferring forces below a predetermined maximum to said element on a portion thereof where the propagation wave vector of oscillation for a given direction of propagation is at an insignificant value and in the direction of the neutral plane of shear vibration in which plane particle displacement reverses itself, whereby the frequency may be changed by the application of force without changing the Q of the resonator, said force transferring means including a force applying element in contact with said element, a force receiving element movable relatively toward and away from said force applying element, and a spring disposed between said force elements.

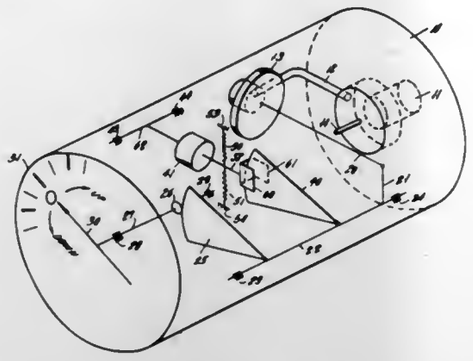


3,274,829
AIRCRAFT INSTRUMENT
Manuel Fernandez, Tampa, Fla., assignor to Honeywell Inc., a corporation of Delaware
Filed June 3, 1963, Ser. No. 291,594
4 Claims. (Cl. 73—178)

1. Vertical reference computing apparatus utilizing orthogonal axes located along the pitch, roll, and yaw axes of a dirigible craft, said apparatus comprising:

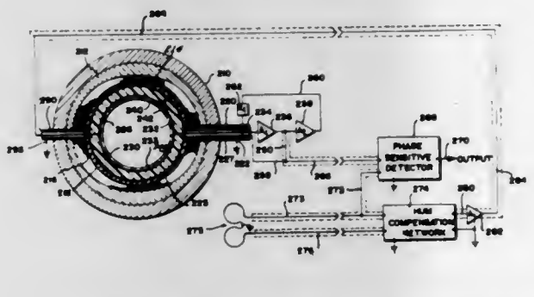
first measuring means responsive to the acceleration of the craft along the pitch, roll and yaw axes thereof for producing signals indicative of said acceleration;

second measuring means responsive to craft movement along the true vertical axis for producing a signal indicative of the acceleration of said craft along said vertical axis;



computing means responsive to said signals for providing a first set of angular indications determined by the position of the craft's coordinate axes and the earth cordinate axes with respect to a first line defined by the intersection of a plane containing the roll axis and the true vertical with a plane containing the pitch and yaw axes, and a second set of angular indications determined by the position of the craft's coordinate axes and the earth coordinate axes with respect to a second line defined by the intersection of a plane containing the pitch axis and the true vertical axis with a second plane containing the roll and yaw axes, and first and second set of angular indications defining the position of the coordinate system of the craft in relation to the earth coordinate system; and

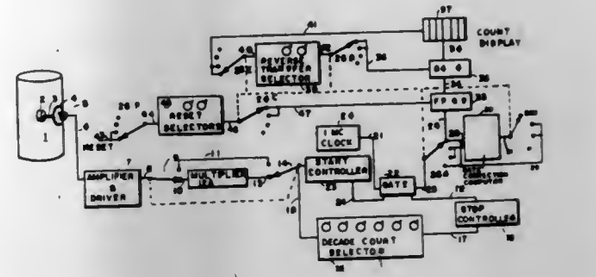
means connecting said first measuring means and said second measuring means to said computing means.



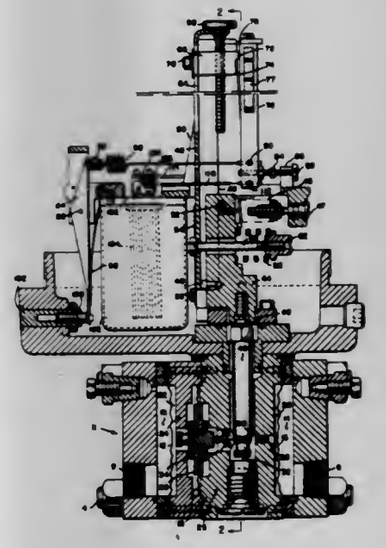
3,274,830
VERTICAL VELOCITY INDICATOR
Walter Angst, Douglaston, N.Y., assignor to Kollsman Instrument Corporation, Elmhurst, N.Y., a corporation of New York
Filed Feb. 18, 1964, Ser. No. 345,672
4 Claims. (Cl. 73—179)

1. A vertical velocity indicator comprising, in combination, pressure-transducer means for measuring a change in static pressure, indicator means for indicating vertical velocity, linkage means for connecting said pressure transducer means to said indicator means, and compensation means operatively connected to said indicator means; said compensation means including means for measuring vertical acceleration and deceleration of said indicator; said compensator means including auxiliary linkage means connected to said indicator means for adjusting the indication of said indicator means in accordance with the lag of said pressure transducer; said auxiliary

linkage means including a first and second link connected through a film of viscous material.



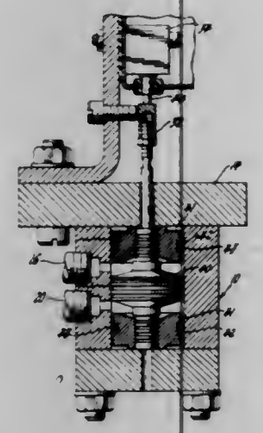
3,274,831
ELECTROMAGNETIC FLOWMETER
Vincent J. Cushing, 9804 Hillridge Drive, Kensington, Md.
Filed Apr. 14, 1965, Ser. No. 449,930
33 Claims. (Cl. 73—194)



1. Magnetic flowmeter apparatus comprising a tubular means of dielectric material through which fluid is adapted to flow, means for producing an alternating magnetic field within said tubular means, detecting means adjacent said tubular means and within said magnetic field for detecting electrical signals in the fluid flowing through said tubular means, said detecting means including at least two separate detecting electrodes electrically insulated from one another, shield means disposed directly outwardly of at least one of said detecting electrodes with respect to the center of the adjacent tubular means, and an electrical network electrically connected with each of said electrodes and with said shield means whereby said electrodes and said shield means are electrically connected with one another.

3,274,832
DIGITAL TEMPERATURE MEASUREMENT AND DISPLAY SYSTEM
Sanborn Hamilton, Kane, Ill., assignor to Riverbank Laboratories, Geneva, Ill.
Filed Oct. 7, 1963, Ser. No. 316,484
18 Claims. (Cl. 73—339)

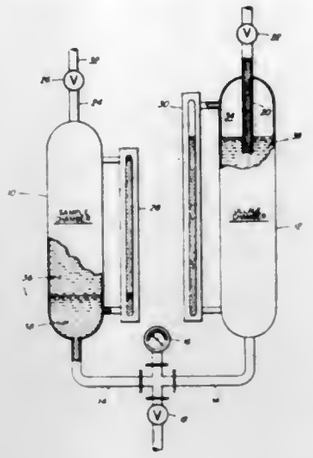
18. Apparatus for measuring temperature and direct digital display of temperature comprising a temperature sensitive transducer producing a fundamental frequency proportional to temperature, a frequency multiplier, fundamental frequency signal of said transducer connected to the input of said multiplier, an AND gate, a control circuit, the multiplied frequency signal output of said multiplier connected to input of said AND gate, said control circuit input connected with said transducer and responsive to the fundamental frequency signal output, said control circuit connected to said AND gate, and said AND gate responsive to signals from said control circuit and multiplier so that the gate output signal always is the multiple frequency and initially commences at the same point with respect to fundamental frequency phase and amplitude.



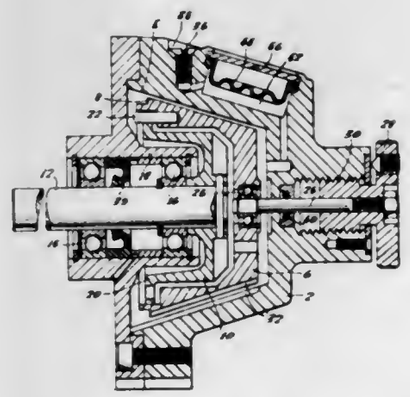
3,274,833
DIFFERENTIAL PRESSURE TRANSMITTERS
Louis A. Ollivier, Huntingdon Valley, and James B. Skitt, Jr., Chalfont, Pa., assignors to Fischer & Porter Company, Warminster, Pa., a corporation of Pennsylvania
Filed Apr. 23, 1963, Ser. No. 275,002
5 Claims. (Cl. 73—407)

1. Apparatus providing an output corresponding to differential pressure comprising a pair of flexible elements subject respectively to pressures the difference of which is to provide said output, means defining a pair of chambers between said flexible elements and including a third flexible element constituting a wall between said chambers, liquid within said chambers transmitting pressures exerted on said first mentioned flexible elements to opposite sides of the third flexible element, a lever having two portions one of which is within one of said chambers and the other of which is external thereto, means connecting said lever within the last mentioned chamber to the third flexible element for movement therewith, a flexible diaphragm element closing the last mentioned chamber and secured to said lever to provide a pivotal mounting therefor, the external portion of said lever being provided by two parts, a spring normally holding said two parts in fixed relationship to each other but yielding upon excessive movements of the portion of said lever within its chamber, means detecting the

position of said lever, means responsive to the detecting means to apply a force to said lever to maintain it in a predetermined position, and means providing an output corresponding to said force.



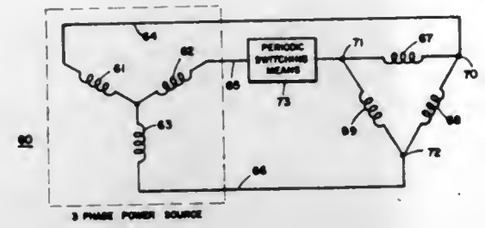
3,274,834
APPARATUS FOR FLUID PRESSURE MEASUREMENT
Ward F. Diehl, New Baltimore, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 20, 1963, Ser. No. 325,111
1 Claim. (Cl. 73—419)



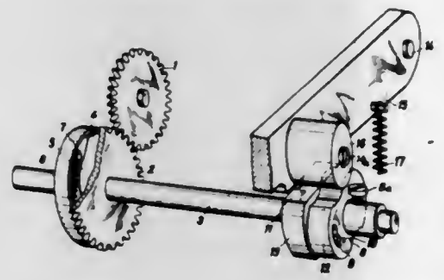
Apparatus for determining whether the pressure exerted by a quantity of hydraulic oil is within a predetermined range comprising: first and second sources of hydraulic oil under respective high and low pressures definitive of said range; first and second pressure comparators each including an enclosing member defining a chamber, a two-sided piston displaceably disposed within the chamber and including portions extending axially outwardly of the chamber in both directions, and stop means adjacent but spaced from said portions for limiting the axial displacement of the piston; means for admitting oil from the first and second sources to one side of the pistons of the first and second comparators respectively; means for admitting said quantity of oil to the other side of the pistons; first and second switch means; first and second actuating plungers disposed in direct axial connection between the first and second pistons and the first and second switch means, respectively, for communicating the position of the pistons to the switch means thereby to condition the switch means accordingly, circuit means connecting the switch means for indicating whether the pressure of said quantity of oil is within said range.

3,274,835
SAMPLE CHAMBER SYSTEM
Donald K. Mosher, Glassboro, N.J., assignor to Mobil Oil Corporation, a corporation of New York
Filed Mar. 18, 1964, Ser. No. 352,840
3 Claims. (Cl. 73—422)

1. An apparatus for the containment of a volatile liquid sample, which prevents fractionation of said liquid sample upon its withdrawal therefrom, which apparatus comprises means defining two chambers, a substantially unobstructed conduit in communication with each of said chambers at the base thereof, one of said chambers being a sample chamber, the other of said chambers being an ullage chamber of an internal volume larger than that of said sample chamber, means to introduce and to remove a sample to and from said sample chamber, means to remove material from and to apply pressure to the top of said ullage chamber which includes an outage tube extending downwardly into said ullage chamber a sufficient distance to insure adequate ullage, and outlet means by which said apparatus may be evacuated.



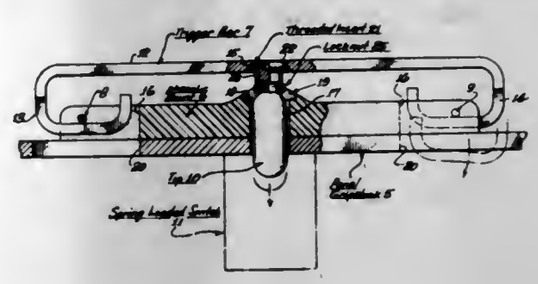
3,274,836
ROTARY DAMPERS
Alan Richard Brine Nash, 39 Abbot's Ride, Farnham, Surrey, England
Filed Oct. 1, 1963, Ser. No. 313,107
Claims priority, application Great Britain, Oct. 5, 1962, 37,684/62
10 Claims. (Cl. 74—574)



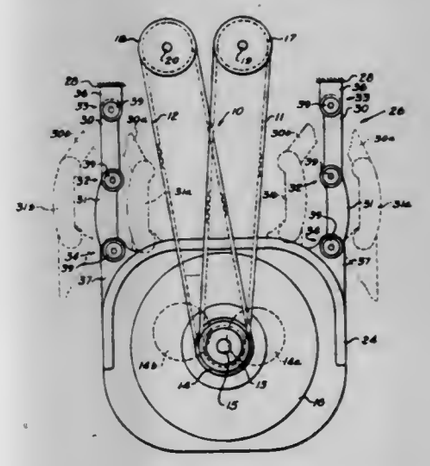
1. A continuous rotation fluid filled damper comprising, in combination, a rotor having a frusto-conical surface, a casing surrounding the rotor, and a support structure, said support structure being rotatably mounted within said casing and being journalled in said casing, said support structure relatively slidably engaging said rotor to maintain the frusto-conical rotor surface coaxial with the correspondingly shaped inner surface of the casing coacting with said rotor surface despite axial movement of the rotor with respect to said support structure, and an adjustable securing device coupled between the rotor and the casing to control the axial position of the rotor in the casing and therefore to control the spacing between said frusto-conical surface on said rotor and said correspondingly shaped inner surface of said casing.

3,274,837
CONTROL APPARATUS
Ralph V. Fenton, Indian Rocks, and William H. Isely, Clearwater, Fla., assignors to Honeywell Inc.
Filed June 1, 1962, Ser. No. 199,502
7 Claims. (Cl. 74—5.7)

1. An improvement in gyroscopic means comprising: a polyphase hysteresis spin motor; means for energizing said motor; means for periodically interrupting one phase of said motor; and means counteracting the effects on said gyroscopic means produced by periodically interrupting said one phase of said motor.



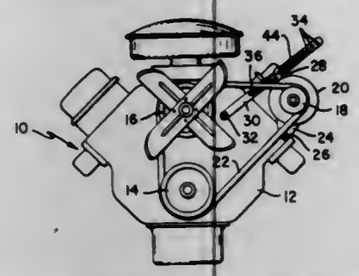
3,274,838
ARRANGEMENT FOR TRANSFORMING A ROTARY MOTION INTO A RECIPROCATING MOTION
Heinz Kelch, Villingen, Germany, assignor to Kienzle Apparate G.m.b.H., Villingen/Schwarzwald, Germany
Filed May 5, 1964, Ser. No. 364,943
17 Claims. (Cl. 74—54)



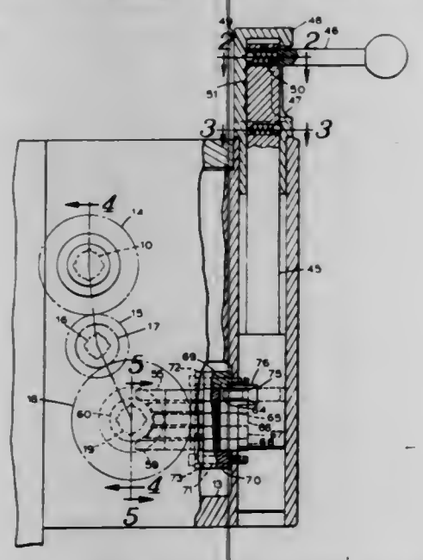
1. An arrangement for transforming a rotary motion into a reciprocating motion, comprising, in combination, a rotary drive member rotating in one direction; a shaft means; uni-directional over-running clutch means connecting said drive member with said shaft means for driving the same in one direction of rotation; a main cam fixed on said shaft means and having at least one rising first cam track having a lower inner end and a higher outer end; an auxiliary cam mounted on said shaft means for free turning movement and having at least a rising second cam track having a lower inner end and a higher outer end; and a reciprocable member having a cam follower baised toward said cam tracks and reciprocated by the same while moving said auxiliary cam between first and second positions in which said outer end of said second cam track trails, or leads, respectively, said outer end of said first cam track in said direction of rotation, said cam follower moving said auxiliary cam from said first to said second position while moving inward from the outer end of said second cam track toward the inner end of said first cam track whereby acceleration of said main cam and of said shaft means in said direction of rotation by engagement of said outer end of said first cam track by said cam follower moving inward is prevented.

3,274,839
ACTUATOR ASSEMBLY
Stanley L. Sather, Pomona, Calif., assignor to General Dynamics Corporation, Pomona, Calif., a corporation of Delaware
Filed May 22, 1964, Ser. No. 369,397
11 Claims. (Cl. 74—102)

1. An actuator assembly comprising: mounting means; a plurality of pins mounted in said mounting means in spaced relationship with each other; actuator means, said actuator means having end portions, each of said end portions being adapted to pivot about an associated one of said pins; and activator means operatively positioned in said mounting means and adjustably attached to said actuator means.

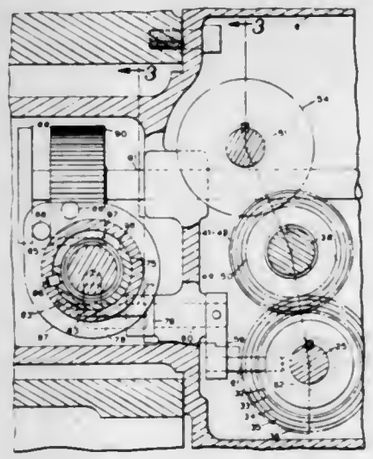


3,274,840
MOTOR SUPPORT
Robert A. Dunn, Willowick, Ohio, assignor to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware
Filed June 12, 1964, Ser. No. 374,781
6 Claims. (Cl. 74—217)



1. In a belt driving system adapted to be readily changed to afford changes in operating speeds and adapted to be self-adjusting after changes in operating speeds, a driving means, a first endless belt means driven by said driving means at a first predetermined speed, a second endless belt means driven by said driving means at a second predetermined speed, a first pulley means driven by said first belt means, a second pulley means driven by said second endless belt means, and a support means connected to said driving means, said support means including a supporting frame, a first link means pivotally secured to said frame, a second link means secured to said first link means for pivotal movement with respect to said first link means, said driving means being pivotally secured to said second link means for both vertical and horizontal movement with the pivotal movement of first and second link means, and including clamping means for clamping said first and second link means against pivotal movement relative to each other and against relative movement with respect to said supporting frame and said driving means, said support means being releasable to suspend the weight of said driving means on said first and second belt means to tighten said first and second belt means, said support means movable with said driving means while said support means is released, said clamping means securing said support means in the position to which said support means is moved to maintain said first and second endless belt means tight.

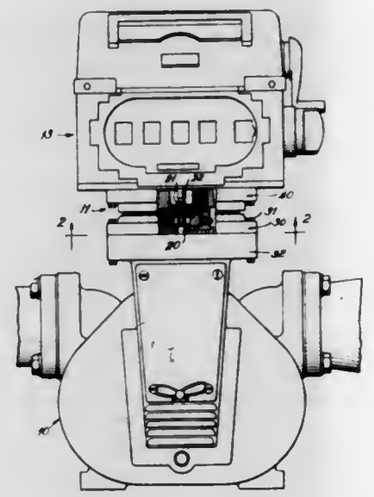
3,274,841
CONTINUOUS TENSION BELT ADJUSTING BRACKET
John W. Roberts, 6408 Highland Ave., Tampa, Fla.
Filed May 6, 1965, Ser. No. 453,627
3 Claims. (Cl. 74—242.13)



1. A continuous tension belt adjusting device for the belt of an electric generator mounted for pivotal movement, comprising:
an elongate rigid bracket arm, said bracket arm having a slot formed therein intermediate the opposing ends thereof;
means mounting one end of said bracket arm to extend in a plane generally normal to the armature shaft of the generator;
a bracket secured to said generator and having a portion extending outwardly thereof;
first pin means secured to the outwardly extending portion of said bracket having a portion thereof extending into and through the slot in said bracket arm, said first pin means being slidable in the slot in said bracket arm from one end thereof toward the other;
second pin means secured adjacent the other end of the slot of said bracket arm; and
tension spring means connecting said first and second pin means for applying a continuous spring tension against the generator, tending to urge the generator about its pivotal mounting.

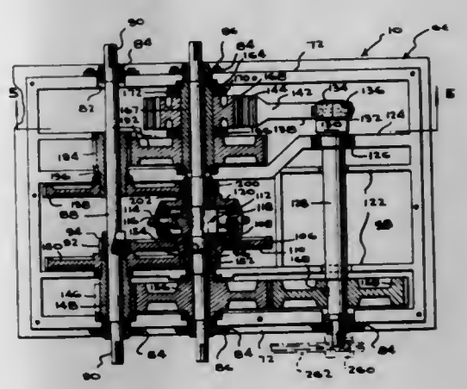
3,274,842
LATHE TRANSMISSION MECHANISM
Robert J. Huff, Xenia, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Filed May 18, 1964, Ser. No. 368,060
11 Claims. (Cl. 74—335)

1. In a transmission having a plurality of pairs of first gears fixed on a first shaft and a plurality of second gears each axially movable on a second shaft parallel to the first shaft and adapted to engage one and the other of the first gears of a pair when shifted one way and the other from a neutral position, a shifting mechanism comprising:
(a) an axially and rotatably movable control member,
(b) means for defining a series of predetermined axial positions of said control member corresponding to the number of pairs of second gears,
(c) means for defining a neutral angular position and two engaging angular positions on opposite sides thereof for said control member,
(d) a set of shifter members connected, respectively, to said second gears, each of said shifter members operable to move one of the second gears connected thereto along the second shaft,
(e) means for rendering a selected one only of said shifter members operable for moving the one of the second gears connected thereto from the neutral position thereof in one and the other directions along the second shaft when said control member is in each of said predetermined axial positions,
(f) means for operating the selected one of said shifter members in response to angular movement of said control member to one and the other of said engaging positions to move the one of the second gears connected thereto in one and the other directions, respectively, from the neutral position thereof, and
(g) means for axially moving said control member from one to another of said predetermined axial positions and for rotation thereof to each of the engaging positions.



3,274,843
LATHE TRANSMISSION MECHANISM
Harry E. Luebkemann, Wilmington, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Filed May 18, 1964, Ser. No. 368,290
10 Claims. (Cl. 74—335)

1. In a transmission, a gear shifting mechanism for movement of a selected one of a plurality of gears along a shaft from and back to a neutral position comprising in combination:
(a) a control member axially movable parallel to the shaft and rotatable from a neutral angular position to an engaging angular position,
(b) a set of shifter members connected, respectively, to said gears, each of said shifter members operable to move the gear connected thereto along the shaft,
(c) actuating means on said control member and positionable therewith for operating a selected one of said shifter members in accordance with the axial position of said control member and upon rotation thereof from the neutral angular position,

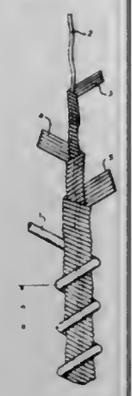


(d) selection means for axially positioning said control member along the shaft to position said actuating means in registration with one of said shifter members, and
(e) means for rotating said control members from the neutral angular position thereof to the engaging angular position when said actuating means is in registration with one of said shifter members.

3,274,844
DRIVE MECHANISMS
William C. Reitz, Jr., Waukegan, Ill., assignor to Liquid Controls Corporation, North Chicago, Ill., a corporation of Illinois
Continuation of application Ser. No. 250,333, Jan. 9, 1963. This application Aug. 13, 1965, Ser. No. 483,006
3 Claims. (Cl. 74—384)

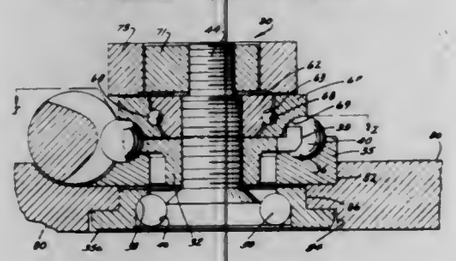
1. A swivel adapter comprising:
(a) an input and an output shaft each having a spur gear rigidly attached thereto;
(b) a first flange rotatably mounting said input shaft, and a second flange rotatably mounting said output shaft,
(c) means mounting said first and second flanges so that the spur gear on the input shaft and the spur gear on the output shaft are between the two flanges and the input and output shafts define a collinear central axis, and so that the flanges can rotate relative to each other about an axis concentric with said central axis;
(d) a pair of bearing races mounted between said flanges, one of said pair of races being non-rotatably connected to one of said flanges and the other of said pair being non-rotatably connected to the other of said flanges, at least one of said pair of races being axially movable on the flange on which it is mounted;
(e) a bearing cage mounted between said pair of bearing races;
(f) roller bearing means mounted within said bearing cage for maintaining a predetermined minimum spacing between sad races and causing said cage to be rotatable about said central axis;
(g) means for resiliently urging the race that is axially movable toward the other race so that said rolling bearing means is in frictional and rolling engagement with said pair of bearing races and responds to relative angular rotation between said flanges by imparting a predeterminedly smaller angular rotation to said bearing cage;
(h) a pair of meshing spider gears rotatably mounted in said bearing cage so that rotation takes place about spaced axes that are parallel to said central axis, one of said spider gears meshing with the gear on said input shaft, and the other of said spider gears meshing with the gear on said output shaft; and
(i) means for limiting radial displacement of said bearing cage about said central axis.

3,274,845
INTERMITTENT DRIVE UNIT
Edward S. Moran, Sr., 159 Fort Hill Drive, Charleston, W. Va.
Filed Sept. 13, 1963, Ser. No. 308,752
5 Claims. (Cl. 74—394)



1. A drive unit operatively interposed between a prime mover and a work element comprising:
(a) a base;
(b) an input safety rotatably mounted on the base and being supplied with rotary movement in one direction by the prime mover;
(c) a drive shaft rotatably mounted on the base;
(d) a control axle rotatably mounted on the base;
(e) gear means drivingly-connecting the input shaft to the drive shaft;
(f) a cross-axle fixed to the drive shaft and carrying beveled gears at each end meshed with a crown gear at one side and another crown gear at the other side;
(g) a first gear train drivingly-connecting the crown gear at the one side of the cross-axle to the control axle;
(h) offset crank means on the control axle;
(i) a rack gear carried by the crank means and movable therewith in two directions as the crank means is rotated by the control axle; and
(j) a second gear train drivingly-connecting the crown gear at the other side of the cross-axle to the rack gear.

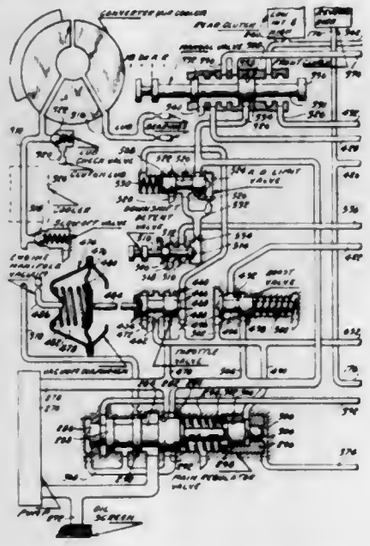
3,274,846
FLEXIBLE CABLE
Johann Forster, Frankfurt am Main, Germany, assignor of one-half to VDO Tachometer Werke Adolf Schindling G.m.b.H., Frankfurt am Main, Germany, and one-half to Firma Golde & Co. G.m.b.H., Frankfurt am Main, Germany, both corporations of Germany
Filed June 2, 1964, Ser. No. 371,966
Claims priority, application Germany, June 7, 1963, V 24,146
4 Claims. (Cl. 74—422)



1. A flexible cable for the transmission of tension- and pressure-forces in axial direction of the cable, comprising
a core,
a plurality of layers of wire-windings wound about said core in opposite directions,
an outer running winding wound under tension with a predetermined pitch about said layers of wire windings,

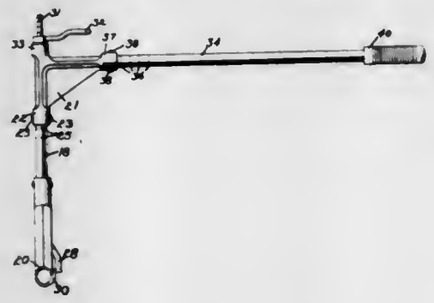
said core comprising a wire of great tensile strength wound helically along its longitudinal axis with said

pitch of said outer running winding and a very large angle of inclination.



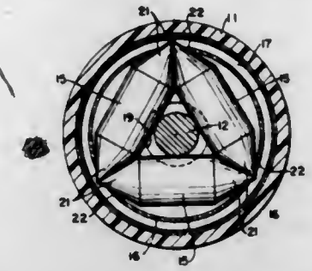
3,274,847
TRANSMISSION
John L. Jones, 231 Diana Ave., Muskegon, Mich.
Filed Feb. 24, 1964, Ser. No. 346,984
10 Claims. (Cl. 74—425)

4. A transmission mechanism, comprising: a worm; a member driven by said worm, said member including a plurality of balls, a concave ball-retaining track, and a caging means for spacing said balls upon said track and for coordinating their movements thereupon; means for securely positioning said worm and said driven member closely adjacent each other, such that the said worm engages and drives the balls of said driven member upon said ball-retaining track, said balls in turn driving said ball caging means; and force-transmitting means operatively connected to and driven by said ball caging means.



3,274,848
MULTIPLE SPEED RATIO POWER TRANSMISSION MECHANISM AND AUTOMATIC CONTROL SYSTEM
Eugene W. Konrad, Northville, and Robert P. Zundel, Wayne, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Aug. 22, 1963, Ser. No. 303,839
12 Claims. (Cl. 74—472)

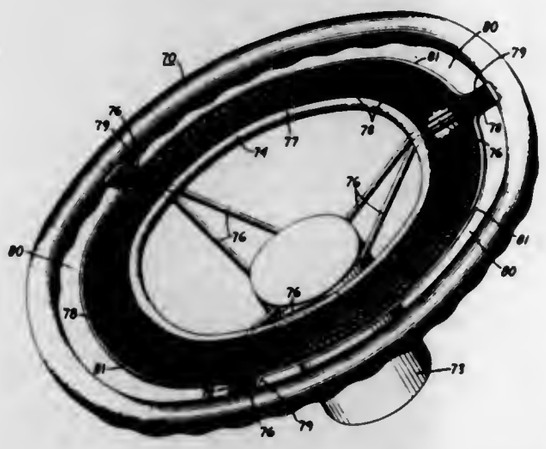
2. In a power transmission mechanism for delivering power from a driver controlled engine to a driven shaft, two fluid pressure operated servo means for controlling the relative motion of torque delivery elements of said mechanism, a fluid pressure source, conduit structure including separate portions extending from said source to each servo means, separate fluid pressure distributor valve means disposed in and partly defining each conduit structure portion, governor valve means for producing a first pressure signal that is proportional in magnitude to driven shaft speed, throttle valve means for producing a second pressure signal that is proportional in magnitude to an engine power factor, branch passage means for subjecting movable portions of said distributor valve means to said signals for actuating them, one distributor valve means and the other distributor valve means responding to increasing driven shaft speed for any given driver demand for engine torque to condition said servos for speed ratio shifts from a low speed ratio to an intermediate speed ratio and from said intermediate speed ratio to a high speed ratio respectively, regulator valve means for maintaining a predetermined operating pressure level for said servos, said one distributor valve means being in fluid communication with portions of said regulator valve means and adapted to control dis-



tribution of pressure thereto in response to shifting movement of its movable portions to an intermediate speed ratio position to cause a decrease in effective pressure maintained by said regulator valve means, and cutback control valve means in fluid communication with said one distributor valve means and with said regulator valve means for modifying the influence of the former upon the latter whereby a reduction in the magnitude of pressure maintained by said regulator valve means is accomplished only when the effective pressure developed by said source is greater than a predetermined value.

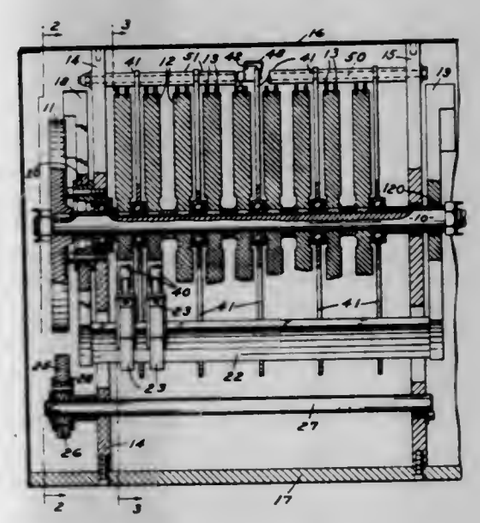
3,274,849
EXTENSION HANDLE FOR OUTBOARDS
Chris A. Hanson, Sandpoint, Idaho, assignor of one-half to Donald J. Diehl, Sandpoint, Idaho
Filed Dec. 9, 1963, Ser. No. 329,007
5 Claims. (Cl. 74—480)

1. An extension handle for a marine outboard motor having a horizontal carrying handle at the front surface thereof, comprising:
- a vertical member having a releasable clamping element at its lower end adapted to be secured to the motor carrying handle;
- and a forwardly directed member fixed to the upper end of said vertical member, said forwardly directed member having a grip mounted on its forward end.



3,274,850
FLEXIBLE PUSH-PULL CONTROL CABLE
Nazarene F. Tascio, 5 Lakeview Ave., East White Plains, N.Y.
Filed Nov. 4, 1964, Ser. No. 408,967
4 Claims. (Cl. 74—501)

1. A flexible push-pull control cable which comprises:
- a flexible outer sheath,
- a flexible control rod centrally positioned within the outer sheath and movable longitudinally with respect thereto, and
- a plurality of individual roller retaining units disposed about the control rod within the outer sheath in substantially stationary contact with said sheath, each roller retaining unit comprising
- a group of rollers disposed about the control rod in substantial rolling contact therewith, the axes of rotation of the rollers of each group being disposed in a plane substantially perpendicular to the longitudinal axis of the control rod,
- an annular roller retainer ring disposed about said group of rollers, the rollers of said group being rotatably mounted in said retainer ring, and
- a roller retaining shell disposed about said roller retainer ring in substantial contact therewith, said retaining shell being substantially in contact with the inner surface of the outer sheath and being substantially stationary with respect thereto,

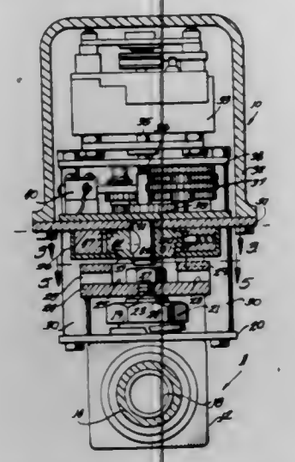


said individual roller retaining units being disposed side by side within the outer sheath throughout the length of the sheath to provide freely rolling and fully articulated support for the longitudinally movable control rod.

3,274,851
STEERING WHEEL ASSEMBLY
Rodger E. Geller, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 18, 1964, Ser. No. 368,302
3 Claims. (Cl. 74—552)

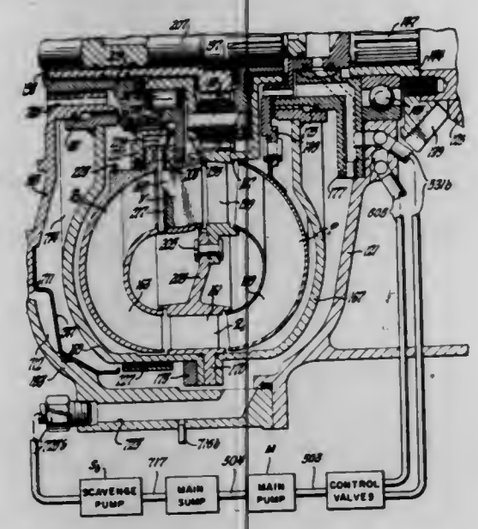
1. On a steering wheel means having a hub portion and a reinforced metal with insulation covering rim portion as well as predetermined rigid support means therebetween, an intermediate structure comprising an auxiliary ring member in a location concentrically between said hub and rim portions, and a resilient body portion of moldable plastic material having an inner periphery along said auxiliary ring member and outer edging along recessing adjacent to said rim portion except for predetermined extensions of said resilient body portion in locations over said rigid support means.

3,274,852
BALL TRACK TIMING DEVICE
Robert J. Ebbert, 135 E. Avon Road, Rochester, Mich.
Filed Mar. 5, 1964, Ser. No. 349,692
20 Claims. (Cl. 74—568)



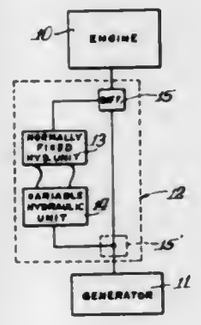
1. A timing device for determining the interval between the median of two events having a variable interval therebetween and a third event of known interval relative to the first event, comprising means for sensing the first event, means for sensing the second event, standard rate means operating during the interval between said first and third events, one-half rate means responsive to said respective sensing means operative during the interval between said first and second events, and means responsive to said one-half rate means upon the occurrence of said second event for determining the interval between the median of said first and second events and said third event.

3,274,853
RATCHET DRIVE ROTARY VALVE ACTUATING MECHANISM
Harold Robert Forsmark, Elmhurst, Ill., assignor to Calco Manufacturing Company, a corporation of Illinois
Filed Nov. 16, 1962, Ser. No. 238,133
3 Claims. (Cl. 74—625)



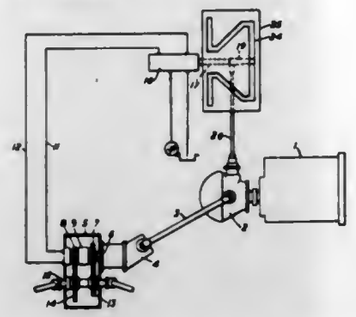
1. A coupling for a motor and valve assembly with said motor including a driver shaft and said valve including a rotatable driven valve stem for rotating said valve to open and closed positions, said stem being coaxially positioned relative to said driver shaft, comprising:
- (a) a rotatable driven member connected to said stem to rotate the same and having a horizontal portion extending radially outwardly from said stem,
- (b) a ratchet member connected to said driver shaft for rotation therewith, said ratchet member including a plurality of teeth and adjacent recessed cam portions sloping outwardly gradually to the peripheral surface of said ratchet member,
- (c) a cylindrical cog carrier rotatably on and coaxially positioned relative to said ratchet member,
- (d) said cog carrier including a central cylindrical recess receiving said ratchet member and an outer circumferentially extending flange,

(e) said flange including a plurality of circumferentially spaced radially extending bores,
(f) a cog slidably disposed in each bore,
(g) means in said bores urging said cogs into said recessed cam portions,



(h) and means on said cog carrier connecting said carrier to said horizontal portion of said driven member, whereby rotation of said shaft in one direction said cog carrier and driven member are rotated,
(i) said cog carrier and said driven member being rotatable in the same direction manually when said ratchet member and driver shaft are stationary.

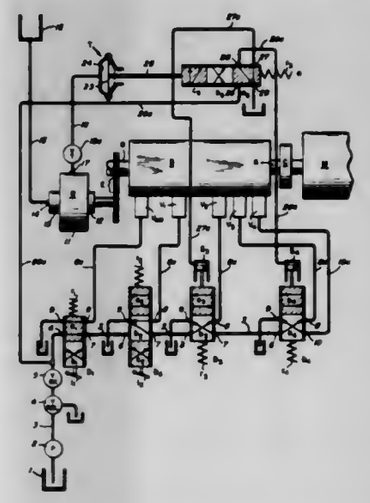
3,274,854
TRANSMISSION
Oliver K. Kelley, Bloomfield Hills, Kenneth W. Gage, Birmingham, and Richard W. Craig, Flint, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application Jan. 7, 1959, Ser. No. 785,390, now Patent No. 3,170,534, dated Feb. 23, 1965. Divided and this application Oct. 16, 1964, Ser. No. 404,371
2 Claims. (Cl. 74—677)



2. In a transmission, a fixed housing, an input member, an output member mounted for rotation with respect to said fixed housing, a fluid drive having a pump connected to said input member, a runner, and a rotary housing within said fixed housing having a wall completely enclosing said pump and runner and providing a fluid operating chamber, a planetary gear unit having first, second and third elements, an element being connected to said rotary housing for rotation therewith, an element being connected to said output member, means for connecting said runner to an element, said rotary housing having a thin annular longitudinally extending wall portion of substantially uniform thickness at the outer perimeter providing an external brake drum surface and an internal cooling surface contacted by fluid circulating through said operating chamber to cool said external brake surface, means to supply fluid to said rotary housing at the inlet to said pump, exhaust means to exhaust fluid from said rotary housing, said pump circulating the fluid supplied to the inlet of said pump across said internal cooling surface and to said runner and to said exhaust means, means to maintain the space between said rotary housing and fixed housing free of fluid, annular brake means located in said space having friction means selectively engaging said brake drum surface to brake said rotary housing to retard rotation of an element of said planetary gear unit to establish a drive.

3,274,855
STARTER-DRIVE SYSTEM
Richard W. Reynolds, Louis Ross, and Charles J. Gantzer, Rockford, Ill., assignors to Sundstrand Corporation, a corporation of Illinois
Filed June 19, 1962, Ser. No. 203,519
40 Claims. (Cl. 74—687)

37. In a transmission for use between a generator and an engine to transmit power in either direction between the generator and the engine for starting the engine from the generator and for driving the generator from the engine, a differential gearing including a generator connectible shaft, an engine connectible shaft, gearing connecting the two shafts in order to drive one from the other, a control shaft, and gearing on the control shaft connected with said interconnecting gearing for varying the rate of rotation of the output shaft of the generator connectible shaft and the engine connectible shaft relative to the rate of rotation of the input shaft thereof depending on the load imposed by the control shaft; a first hydraulic unit, means for varying the displacement of said first hydraulic unit, a second hydraulic unit, means for varying the displacement of said second hydraulic unit, conduit means interconnecting said first and second hydraulic units to deliver fluid therebetween, either of said conduits being capable of being under pressure so that torque can be transmitted in either direction from one hydraulic unit to the other; gearing connecting one of said hydraulic units to said control shaft to control the torque of said control gear, gearing connecting one of said shafts to the other hydraulic unit; a predetermined torque program, means responsive to said predetermined torque program after said generator connectible shaft has attained a predetermined speed for controlling one of said displacement varying means to control the torque delivered by the engine connectible shaft; and means responsive to rotation of the generator connectible shaft when driven by the engine connectible shaft for controlling said one displacement varying means to maintain the generator connectible shaft at constant speed.

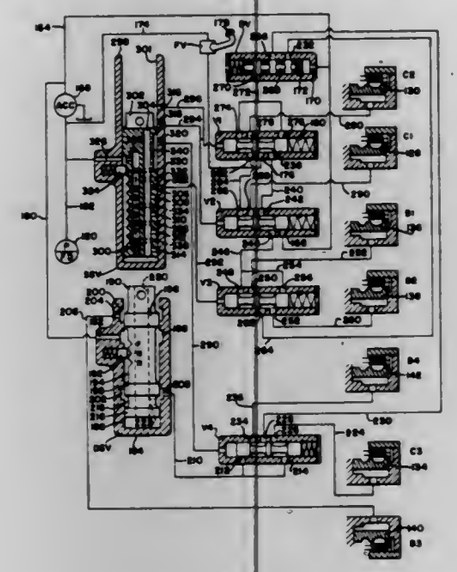


3,274,856
HYDRAULIC APPARATUS
Geoffrey L. Harrison, Scarborough, Ontario, Canada, assignor to Dowty Equipment of Canada Limited, Ajax, Ontario, Canada, a Canadian company
Filed Oct. 21, 1963, Ser. No. 317,537
Claims priority, application Great Britain, Oct. 30, 1962, 41,047/62
4 Claims. (Cl. 74—733)

1. A power transmission comprising a positive displacement pump, a positive displacement motor, hydraulic passage means connecting the pump to the motor, motor speed adjustment means operable on one of the pump and the motor displacements to vary motor speed, a mechanical gearbox, an input shaft for said gearbox driven by the said motor, an output shaft for said gearbox, at least two selectable gears of differing speed ratios engageable within said gearbox between the output and the input shafts, a selector for the gears in the gearbox, a single control operatively connected both to the motor speed adjustment means and to the selector, and a gate locating said control for movement in a predetermined path having a pair of parallel portions corresponding one to low gearbox speed ratio and the other to high gearbox speed ratio, movement in either of which portions adjusts motor speed without adjustment of the gearbox selector, and a transverse connecting portion between the parallel portions having an inclination thereto, movement through said transverse portion serving to move the selector to change mechanical gear and to move the motor speed adjustment means to adjust motor speed inversely in proportion to the proportional change of gear speed ratio, whereby after movement of the control through the said transverse portion, the speed of the output shaft is substantially the same as the speed of the load.

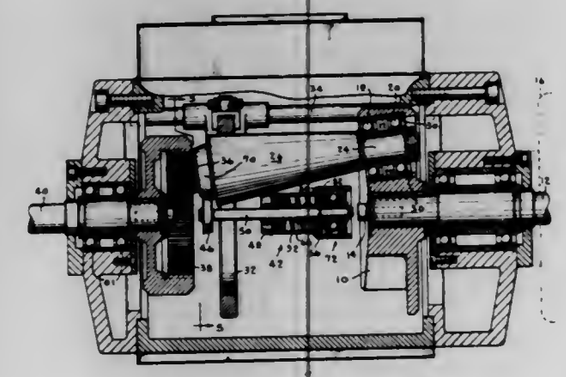
3,274,857
PRESSURE REGULATOR AND A HYDRAULIC CONTROL DEVICE INCLUDING SAID REGULATOR FOR AN AUTOMOBILE GEARBOX
Jean-Paul Brunot, Sens (Yonne), France, assignor to Centre de Recherches de Pont-a-Mousson, Pont-a-Mousson (Meurthe-et-Moselle), France, a French body corporate
Filed Feb. 8, 1963, Ser. No. 257,341
Claims priority, application France, Feb. 13, 1962, 887,860, Patent 1,322,233
6 Claims. (Cl. 74—752)

4. A hydraulic change speed device for changing speeds of a gearbox of a transmission unit having an output shaft in response to the rotational speed of said output shaft, said device comprising hydraulically-actuated elements for respectively changing said speeds of said gearbox, a source of liquid under pressure, a hydraulic actuating circuit connecting said source to said hydraulically-actuated elements, a pilot distributor inserted in said hydraulic actuating circuit and having a slide valve which is slidable between a first position and a second position and controls the supply of said liquid under pressure from said source to each of said hydraulically-actuated elements, movement of said slide valve from said first position to said second position resulting in the course of said movement in said hydraulically, actuated means changing up said speeds of said gearbox, a hydraulic control device for shifting said slide valve, said control device comprising a source of liquid, a hydraulic pressure regulator operating on the centrifugal pump principle and having a fluidtight chamber, a rotary impeller in said chamber, a driving shaft, drivingly connected to said impeller, an inlet passageway putting said chamber in communication with the last-mentioned source of liquid and a pressure outlet passageway communicating with said chamber, the pressure of the liquid issuing from said outlet passageway increasing with increase in the rotational speed of said driving shaft, means drivingly connecting said output shaft to said driving shaft, pressure-transmitting control means movable between a first position and a second position, a conduit putting said pressure outlet passageway in communication with said pressure-transmitting control means,



said chamber, said outlet passageway and said conduit constituting a pilot control circuit independent of and separate from said actuating circuit, means operatively connecting said pressure-transmitting control means to said slide valve, and resiliently yieldable means biasing said interconnected control means and slide valve towards said first positions thereof, said pilot control circuit being liquidtight and preventing any relief of liquid pressure in respect of a range of pressures of the liquid in said pilot control circuit corresponding to normal operation of said change speed device, whereby a progressively increasing rotational speed of said output shaft produces a build up of the pressure of the liquid in said pilot control circuit having for result a progressive movement of said slide valve from said first position to said second position thereof in opposition to the action of said resiliently yieldable means and a changing of said speeds of said gearbox.

3,274,858
TRANSMISSION
Raymond J. Meyer, James K. Jensen, and Peter D. Wetrich, Waterloo, Iowa, assignors to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Jan. 17, 1964, Ser. No. 338,338
12 Claims. (Cl. 74—761)



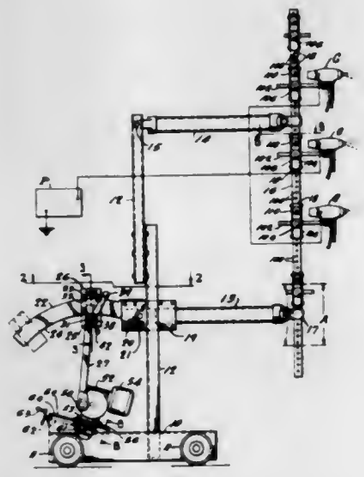
7. A transmission, comprising: a front section having planetary gearing including two clutches and two brakes selectively engageable in four clutch-brake combinations to produce four forward speeds in an intermediate drive element; a rear section including planetary gearing driven by said element, an output shaft, a third clutch acting on said rear section gearing and engageable in all of said four combinations to utilize said four speeds to drive the output shaft at four forward speeds, and a third brake acting on said rear section gearing engageable, in lieu of said third clutch, in all of said four combinations to utilize said four speeds to drive the output shaft in reverse; and

a fluid pressure control system including a pressure source, four selectively chargeable actuators for respectively engaging said front section clutches and brakes, two additional actuators selectively chargeable for respectively engaging the third clutch and third brake, a first valve movable selectively among four positions for connecting

combinations of said four actuators to the pressure source to achieve said four clutch-brake combinations, and a second valve movable between forward and reverse positions independently of the first valve for alternately connecting the two additional actuators to the pressure source to alternately engage the third clutch and the third brake.

3,274,859
TORQUE SWITCH FOR VARIABLE SPEED TRANSMISSIONS
Richard E. Alsch, Lannon, Wis., assignor to Graham Transmissions, Inc., Menomonee Falls, Wis., a corporation of Delaware
Filed Nov. 13, 1963, Ser. No. 323,428
12 Claims. (Cl. 74—796)

1. A variable speed transmission having a rotary carrier which is rotated by an input shaft; a plurality of longitudinally tapered planetary rollers having oppositely tapered nose portions and being rotatably mounted in the carrier for rotation with, and in respect to, the carrier; a motion transmitting member rotatable by each of the rollers; a ring member in contact with the motion transmitting members and connected to an output shaft; and an axially movable control ring encircling the rollers and being in contact with the rollers, whereby the contact pressure therebetween determines the torque output of the transmission, comprising in combination:



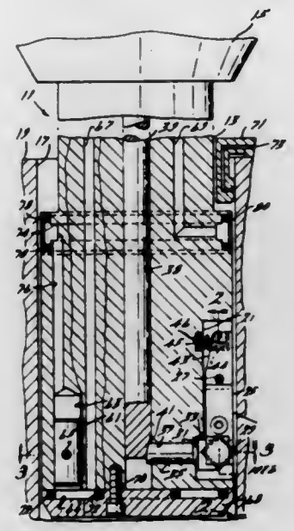
a first pressure roller in contact with the nose portions of the planetary rollers,

a second pressure roller movable relative to said first pressure roller and in contact with the planetary rollers,

spring means exerting a bias on said pressure rollers to establish a predetermined contact pressure between the planetary rollers and the control ring, and

centrifugal means associated with said pressure rollers and said spring means and being operable to vary said bias in response to a change in the rotational speed of said planetary rollers to thereby correspondingly vary said contact pressure.

3,274,860
CONTROLLABLE RECIPROCATOR
William D. Gauthier, Sylvania Township, Lucas County, and Erhard Kock, Toledo, Ohio, assignors to The De Vilbiss Company, Toledo, Ohio, a corporation of Ohio
Filed Mar. 23, 1964, Ser. No. 353,837
3 Claims. (Cl. 74—829)

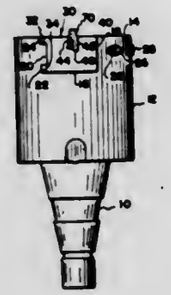


3. A mechanism for reciprocating an electrostatic spray gun or the like comprising a frame, spaced parallel arms pivoted on spaced points on said frame, a gun mounting stem connecting said arms, one of said arms extending on the opposite side of said frame to provide a driving lever for said stem fulcrumed on said frame, drive means including a connecting rod to reciprocate said driving lever, means to adjust the point of connection between said connecting rod and said driving lever towards and away from said fulcrum to vary the length of the reciprocating stroke of said stem, and additional means to adjust the position of the driven end of said connecting rod about said fulcrum to vary the midpoint of said reciprocating movement without significantly changing the length of said reciprocating stroke, said driving lever being arcuate about a center near the midpoint of the adjustment of said additional means.

3,274,861
EXPANDABLE ROTARY BORING TOOL
Albin S. Czubak, Detroit, Mich., assignor to Micromatic Hone Corporation, Detroit, Mich., a corporation of Michigan
Filed Oct. 8, 1964, Ser. No. 402,503
8 Claims. (Cl. 77—58)

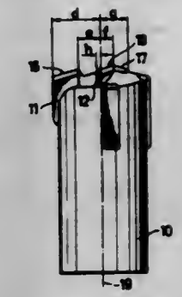
1. In an expandable boring tool including a drive spindle rotatable about a longitudinal axis and reciprocable therealong,

at least one boring tool assembly pivotally carried by said spindle for movement about an axis normal to said longitudinal axis and disposed adjacent the periphery thereof,



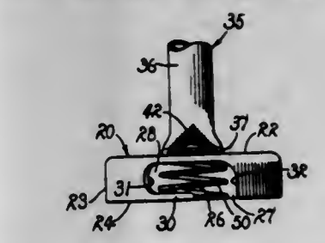
means for pivotally adjusting said boring tool assembly radially of said spindle including a rod movable axially within said spindle and having a longitudinally tapered surface operatively engaging said tool assembly,

and releasable locking means for said tool assembly,



said locking means including a wedge member movable axially within said spindle and engageable with a complementary shaped wedge surface formed on said tool assembly.

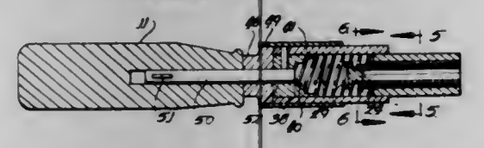
3,274,862
BORING BAR
Edward Babich, Farmington, and Robert H. Leidal, Livonia, Mich., assignors to Galaxy Boring Company, Farmington, Mich., a corporation of Michigan
Filed Apr. 12, 1965, Ser. No. 447,333
8 Claims. (Cl. 77—58)



1. An elongated boring bar having a cutter end support section with a face extending normally to the longitudinal axis of the bar; a slot of uniform cross-section formed across the end of the face, said slot having a pair of opposed sides formed from a unitary section skewed with respect to one another so that lines along each parallel to the end face of the bar are parallel to one another and so that the edges of the sides adjacent to the face of the cutting support are closer to one another than the edges at the bottom of the slot, one of the sides extending normally to said end supporting section face and the bottom of the slot extending normally to the other side thereof; a plurality of holes formed through one side of the bar from the side of the slot which extends normally to the end support section face, normally to that side; set screws threaded in said holes; and an elongated cutter having a cross-sectional configuration such as to allow it to slide into the slot from the end and to be locked therein by the set screws.

3,274,863
CHIP CUTTING ROTARY DRILL
Kurt Heinrich Albert Erich Faber, Sandviken, Sweden, assignor to Sandvikens Jernverks Aktiebolag, Sandviken, Sweden, a corporation of Sweden
Filed Nov. 1, 1965, Ser. No. 505,724
Claims priority, application Sweden, Apr. 12, 1962, 4,068/62; Jan. 22, 1963, 672/63
16 Claims. (Cl. 77—67)

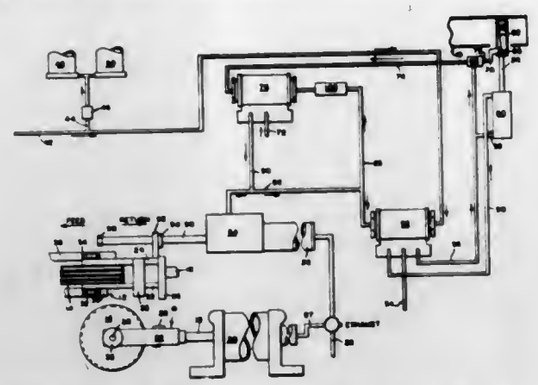
1. A chip cutting rotary drill for metal drilling comprising a shank portion and cutting inserts of sintered hard metal with two main cutting edges extending in opposite direction from the axis of the drill and adapted to generate a forwardly tapering frusto conical surface, said main cutting edges being adapted to generate adjacent annular zones of said frusto conical surface which at least touch each other, at the most a minor part of said zones overlapping each other, the drill further having a central secondary cutting edge which is situated on the same hard metal insert as at least one of the main cutting edges and adapted to generate a rearwardly tapering conical zone, the inner end of said secondary cutting edge extending at least to said axis, said main cutting edges and said secondary cutting edges being so positioned relative to each other that the forwardly tapering frusto conical surface generated by the former will at least touch the rearwardly tapering conical zone generated by the latter, all of said cutting edges being rectilinear and situated substantially in the same plane containing said axis and having front surfaces directed in the same direction as said axis, the total cutting edge length on each side of said axis being at least approximately equal.



3,274,864
DEVICE FOR REMOVING AND REPLACING RADIATOR CAPS
Kenneth H. Chapman, Bakersfield, Calif., assignor of one-half to Michael A. Easley, Bakersfield, Calif.
Filed Jan. 11, 1965, Ser. No. 424,752
3 Claims. (Cl. 81—90)

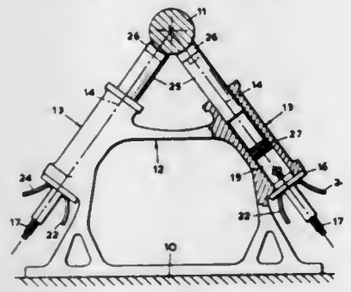
1. A device for removing and replacing a cap on a cooling system radiator with the cap having thermally conductive gripping portions comprising cap engaging means having an annular wall adapted to be disposed in circumscribing relation about the cap, said wall including a pair of opposed circumferentially extended slots to receive said gripping portions of the cap between a first admitting and ejecting position with the slots permitting angular movement of the cap engaging means relative to the gripping portions of the cap, and a second cap retentive position with the cap engaging means angularly displaced from said first position with the wall of said

slots in frictional engagement with the gripping portions of the cap; resilient force means having an end mounted on said cap engaging means and an opposite end for direct engagement with said cap to maintain said cap engaging means in said retentive position relative to the cap; and elongated manipulating means connected to the cap engaging means having a distal portion for rotating the cap by an operator at a distance insuring safe removal and replacement of the cap.



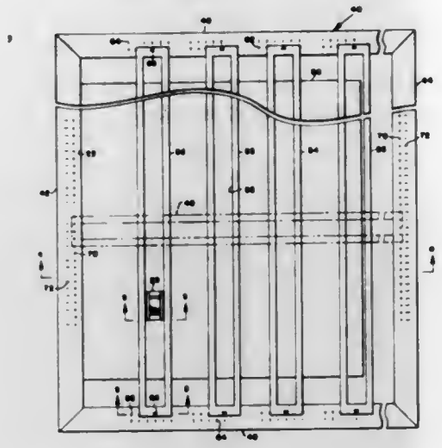
3,274,865
NESTING SOCKET WRENCH
Joseph J. Sweeney, 714 E. Rockwell, Arlington Heights, Ill., and Michael M. Egan, Jr., 8045 N. Kostner Ave., Skokie, Ill.
Filed May 7, 1965, Ser. No. 453,958
7 Claims. (Cl. 81—185)

1. A unitary socket wrench having a handle portion and a socket portion, said socket portion including a plurality of springs adapted to be concentrically arranged within one another; a plurality of concentric, polygonally shaped nested sockets, the intermediate ones of said sockets having the ends of one or more of the side walls thereof bent outwardly to form a shoulder thereon for retaining said sockets within one another, first means secured to the innermost one of said sockets having a spring receiving cavity formed therein; a generally tubular shaped member; the outermost one of said sockets being adapted to one end of said generally tubular shaped member; second means adapted to the opposite end of said generally tubular shaped member and having a plurality of concentrically positioned spring receiving cavities formed therein which have diameters which substantially correspond to the diameters of predetermined ones of said springs; said plurality of spring being retained within said generally tubular shaped member with the ends of one of said plurality of springs being engaged in said spring receiving cavities formed in said first and second means; the ends of the intermediate ones of said springs being engaged in respective ones of said concentrically positioned spring receiving cavities formed in said second means and with said shoulders formed on respective ones of said sockets; and the ends of the outermost one of said springs being engaged with the end edge of said second means and the inner end edge of the outermost socket.



3,274,866
AUXILIARY FACING STOP CONTROL SYSTEM
Gerald B. Lanphere, Central Square, N.Y., assignor to Lipe-Rollway Corporation, Syracuse, N.Y., a corporation of New York
Filed Apr. 10, 1964, Ser. No. 358,833
1 Claim. (Cl. 82—34)

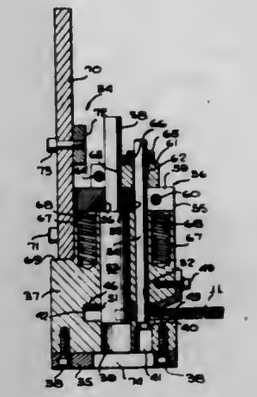
In a bar feed machine having a stock tube and a main cylinder driving a feed carriage for feeding bar stock through said stock tube, the improvement of an auxiliary facing stop control system comprising, an auxiliary feed cylinder having its rod connected to said drive carriage for limited movement relative thereto, said auxiliary cylinder normally supplementing the driving force imparted to said carriage by said main cylinder, stop means in said stock tube for stopping the feed of a fresh bar stock as it approaches the forward end of said tube, signal means operated by said stop means operable to actuate clamp means to clamp the rod of said auxiliary cylinder against further driving advancement and withdraw said stop means from said tube, said drive cylinder driving said carriage an additional amount forward, said amount being determined by the limited movement connection between said carriage and said auxiliary rod, said additional amount of movement positioning said fresh bar stock for end facing and time delay means operable to release said clamp means upon completion of end facing of said bar stock, said limited movement connection between said



rod and said carriage comprising an arm affixed to said carriage, said rod passing through a clearance aperture in said arm, said rod having a collar removable affixed thereto for variable positioning along said rod and a nut affixed to the outer end of said rod, said arm being positioned on said rod between said collar and said nut to provide said limited movement between said carriage and said rod.

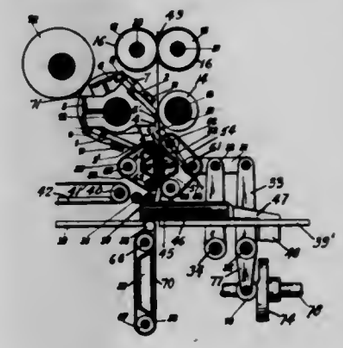
3,274,867
MACHINE TOOL APPARATUS
John Brian Sell, Rugby, England, assignor to The English Electric Company Limited, London, England, a British company
Filed Apr. 30, 1964, Ser. No. 363,961
Claims priority, application Great Britain, May 3, 1963, 11,552/63
1 Claim. (Cl. 82—39)

Machine tool apparatus including a machine tool for carrying out machining operations on a workpiece which is turned on a horizontal axis during a machining operation in the machine tool, including support means for the workpiece arranged to bear at least part of the weight of the workpiece, said support means comprising two fluid-pressure operated stays supported on a firm base, each said stay including a support member for supporting part of the weight of the workpiece and movable axially with respect to said firm base, and a cylinder assembly operatively connected to the support member, the cylinder assembly comprising a fluid-containing cylinder and a piston arranged for axial movement therein under the influence of pressure in said fluid, and said support members being arranged to engage the workpiece at the same cross-section thereof, wherein said cylinders are interconnected through fluid duct means which is connected to hydraulic accummulator means, so that the fluid can pass into and out of said cylinders while a workpiece of non-uniform contour is being turned in the machine tool, whereby the support members can move axially so as to follow said contour, the accumulator means tending to cause fluid pressure in said cylinders to be maintained at a predetermined value.



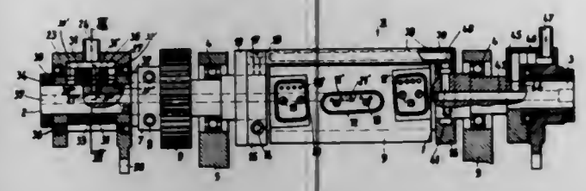
3,274,868
SYSTEM FOR CUTTING FIBERGLASS DUCT BOARD
Theodore M. Williams, 979 Volusia Ave., Daytona Beach, Fla.
Filed Jan. 6, 1965, Ser. No. 423,666
8 Claims. (Cl. 83—5)

1. A device for use in cutting flat fiberglass duct board having a longitudinal edge to provide in one side of the board a plurality of grooves extending parallel to and over the full length of said edge, whereby the board may thereafter be folded along said grooves into a polygonal cross-sectioned duct, comprising a frame having means for the reception of a flat duct board of predetermined maximum nominal length and width, a plurality of elongated guide means, means on the frame providing a stop engageable with said edge of a duct board to locate the same in a predetermined position relative to the frame, and means locating each of said guide means on the frame in a selected one of a plurality of positions spaced apart laterally of the guide means, said guide means extending over said means for the reception of a duct board so as to be in closely overlying relation to a board received therein and each having means for the guiding of a cutting tool in its movement longitudinally of the guide means, said guide means being spaced apart a distance which is a function of the desired cross-sectional dimensions of a duct to be formed from a board cut using said device, said guide means and said means on the frame for reception of a duct board having a length substantially in excess of said maximum nominal length, and additional tool-engageable guide means cooperable with a tool to provide a joint cut extending parallel to the grooves, said additional guide means being disposed on the side of said first-mentioned guide means opposite said stop, and means for locating said additional guide means in a selected one of a plurality of positions in each ot which said additional guide means extends in parallel co-planar relation to said first-mentioned guide means.



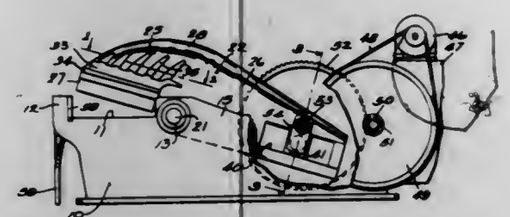
3,274,869
METHOD OF SIMULTANEOUSLY PUNCHING A HOLE AND PIERCING AN EDGE PORTION IN THE LIP OF A PLASTIC BAG
Thomas E. Piazze, Mount Vernon, Ohio, assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Original application June 19, 1962, Ser. No. 203,567. Divided and this application Apr. 16, 1964, Ser. No. 360,219
6 Claims. (Cl. 83—52)

3. The method of forming an opening within the lip of a plastic bag formed of thin gauge sheet material, which openings is separated from the transverse lip defining edge of said bag by material having a predetermined longitudinal extent, said method comprising simultaneously removing a portion of said lip to define said open-



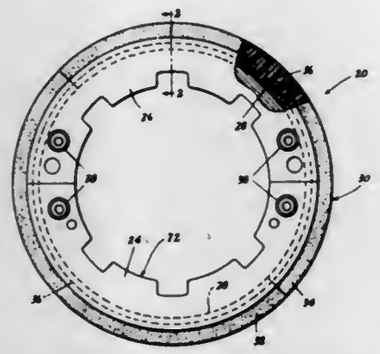
ing and piercing at least that portion of said transverse edge which is longitudinally aligned with said opening.

3,274,870
MEANS FOR CUTTING A WEB TO PRODUCE OVERLAPPED SHEETS
Alfred Schmermund, 60 Kornerstrasse, Gevelsberg, Westphalia, Germany
Filed June 4, 1963, Ser. No. 285,352
Claims priority, application Germany, June 8, 1962, Sch 31,596
8 Claims. (Cl. 83—88)



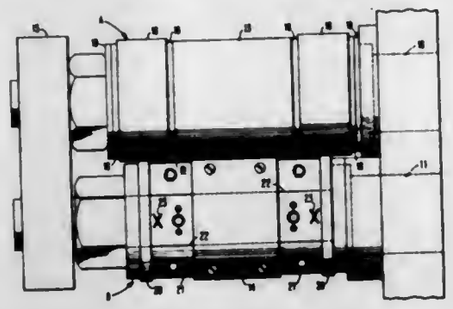
1. In a packing machine in which an article to be packed is embraced in a U-shaped manner by a wrapping having a longer and a shorter portion of wrapping material in overlapping relationship and in which the two wrapping material portions are cut from a single web of said material, the combination of a rotatable cutter, a counter roller positioned for cooperating with said cutter, a first cutter blade and a second cutter blade on said cutter for cutting by pressure against said counter roller, means for feeding a web of said wrapping material between said cutter and said counter roller prior to a cut effected by said first cutter blade, means for accelerating the feed of said wrapping material between said cutter and said counter roller subsequent to the cut effected by said first cutter blade and prior to a cut effected by said second cutter blade so as to bring a second cut portion into overlap with a first cut portion, a first and second suction belt arranged along the path of movement of the wrapping material and after the cutter when viewed in the direction of feed of said wrapping material, for taking over the further transport of said longer wrapping material portion subsequent to cutting by said first cutter blade, and a third suction belt opposite said first suction belt for transporting the end of said shorter wrapping material portion into overlap with said longer wrapping material portion.

3,274,871
WINDOW-CUTTING DEVICE FOR ENVELOPES AND BAG-MAKING MACHINES
Günter Ehlscheid, Niederbieber uber Neuwied, Germany, assignor to Richard Winkler, Rengsdorf uber Neuwied, Germany, and Kurt Dunnbier, Gladbach, Germany
Filed Jan. 19, 1965, Ser. No. 426,627
Claims priority, application Germany, Jan. 24, 1964, W 36,040
8 Claims. (Cl. 83—99)



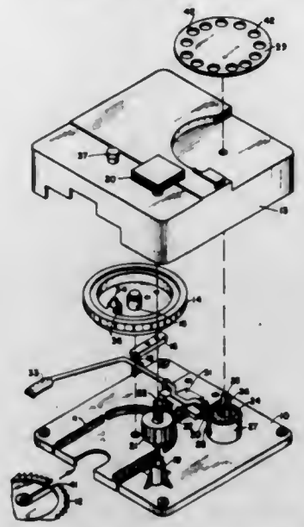
1. A window-cutting device for cutting several windows into blanks for envelopes and flat bags, said cutting device comprising, in combination, a rotary cutting roller and a counter roller for successively feeding blanks to be cut therebetween, several closed cutting knives mounted on said cutting roller, said cutting roller including ports in each of the surface areas bounded by said knives, ducts for connecting the ports of each knife with a supply of suction air and ducts for connecting said ports with a supply of pressure air, control means actuated by said rotary cutting roller and controlling said ducts for sequentially connecting said ports at predetermined time intervals with said suction ducts and said pressure ducts and for disconnecting said ports at said predetermined time intervals from said ducts, timing means coacting with said control means for varying said time intervals independently for the ports of each of the said knives, guide means supported on the peripheral wall of said cutting roller for guiding the leading edge of each blank to be cut, and setting means for varying the circumferential position of said guide means in reference to said cutting knives.

3,274,872
METAL SHEARS
James O. F. Kirsten, Box 86, Lannon, Wis.
Filed Jan. 12, 1965, Ser. No. 425,017
9 Claims. (Cl. 73—339)



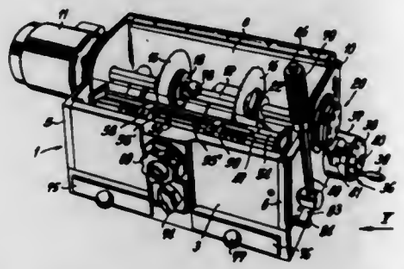
1. In a power-driven shear for cutting metal workpieces, a base having a forward portion providing a table for supporting the workpieces during shearing, a shear blade mounted along an edge of the base forward portion and substantially coextensive with the length of the table, the base having a holding block at the forward end of the table and extending above the table for limiting forward moving of workpieces during shearing and relative to the table, a jaw pivoted on the base adjacent the rearward end of the table and having portions extending forward and rearward from the pivot point, a shear blade mounted on an edge of the forward portion of the jaw for coaction with the base shear blade, the base table being wider than the general thickness of the jaw and extending laterally toward one side from the coacting edges of the shear blades, and a power drive mounted on the base and comprising a source of power and speed reducing gearing driven by the power source and means connecting the gearing with the jaw for oscillating the jaw to secure shearing coaction of the blades.

3,274,873
ROTARY ANVIL CONSTRUCTION
Louis E. Sauer, St. Louis, Mo., assignor to L. E. Sauer Machine Company, St. Louis, Mo., a corporation of Missouri
Filed June 1, 1964, Ser. No. 371,455
6 Claims. (Cl. 83—347)



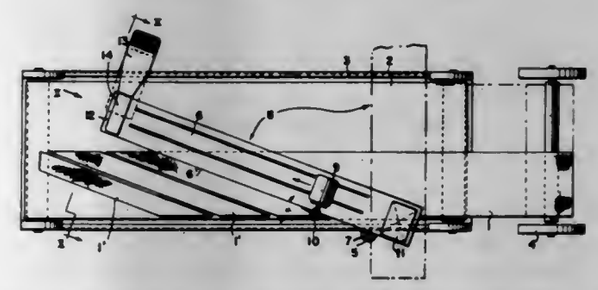
1. In combination, an anvil for rotary die cutting, and the like, comprising an annular base member, and an annular unitary cover mounted on said base member for annular movement bodily in respect thereto, said base member and said cover including axially spaced interfitting annular grooves and ridges, said grooves being constructed for substantially tangential mounting therein of said ridges.

3,274,874
WEB PERFORATING MECHANISM WITH RESILIENT SLEEVE SUPPORTED BACK-UP ROLL
Walter C. Treiber, Endwell, and Richard A. McGill, Endicott, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Sept. 10, 1964, Ser. No. 395,489
5 Claims. (Cl. 83—348)



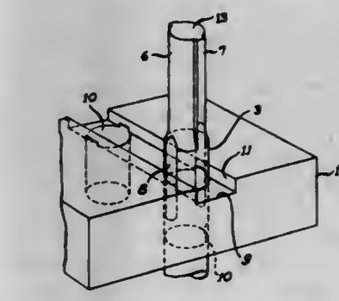
1. In a perforating mechanism for a traveling web of sheet material, the combination of;
a pair of rotatable feed roll assemblies between which the web passes;
one of said feed roll assemblies being provided with radially disposed perforating tools and bearer rolls located near said tools; and
the other of said feed roll assemblies being provided with back-up rolls each of which has an elastic sleeve for resiliently supporting same, said sleeves being compressively positioned with respect to the axes thereof and coacting with said bearer rolls for accurately positioning said bearer rolls and tools with respect to said back-up rolls regardless of change in distance between the axes of said feed roll assemblies.

3,274,875
APPARATUS FOR SELECTIVELY REMOVING TOOTHED PORTIONS OF A TOOTHED CAM
Milton Chernack, West Hempstead, N.Y., assignor to Prestodial Inc., Manhattan County, N.Y.
Filed Aug. 28, 1964, Ser. No. 392,783
2 Claims. (Cl. 83—411)



1. A programming device comprising, a base plate, a cover mounted above said plate, a main gear mounted for rotation between said base plate and said cover, a pinion gear in meshing relationship with said main gear mounted for rotation between said base plate and said cover, a means for rotating said pinion gear, a ratchet gear mounted for rotation between said base plate and said cover said ratchet gear having regular gear teeth in meshing relationship with said main gear, a dial attached to said ratchet gear for sequentially positioning a toothed cam, a knife blade attached to said plate, said blade being positioned over the teeth of said toothed cam and a lever attached to said base plate and positioned over said knife blade whereby the activation of said lever depresses the knife blade so that the selected teeth of said toothed cam are cut off.

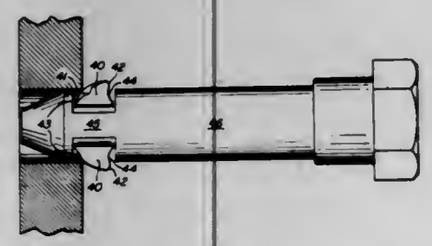
3,274,876
APPARATUS FOR SYMMETRICALLY CUTTING A CAST LINE
Karl Debus, Bad Homburg vor der Hohe, Germany, assignor to Linotype G.m.b.H., Frankfurt am Main, Germany
Filed Oct. 13, 1964, Ser. No. 403,526
Claims priority, application Germany, Oct. 15, 1963, L 46,049
20 Claims. (Cl. 83—415)



1. An apparatus for symmetrically cutting a workpiece, comprising, in combination, a support; cutting means including two cutting members spaced in one direction from each other and mounted on said support spaced equal distances from a transverse plane of symmetry; holding means mounted on said support for supporting a workpiece, said holding means being movable on said support in a direction transverse to said one direction; a centering device mounted on said support in a position symmetrical to said plane of symmetry and adapted to engage said workpiece and to block further movement of the same in said one direction when the same is disposed on said holding means in a centered position in which a selected point thereof is located in said plane of symmetry; and operating means for moving said holding means to a position in which said cutting members cut said workpiece equal distances from said selected point thereof.

3,274,877
BIAS CUTTER FOR WEBS, ESPECIALLY FOR LAYERS OF TIRES
Alfred Seyler, Hannover, Germany, assignor to Continental Gummi-Werke A.G., Hannover, Germany
Filed Nov. 16, 1964, Ser. No. 411,315
Claims priority, application Germany, Nov. 19, 1963, C 31,458
4 Claims. (Cl. 83—473)

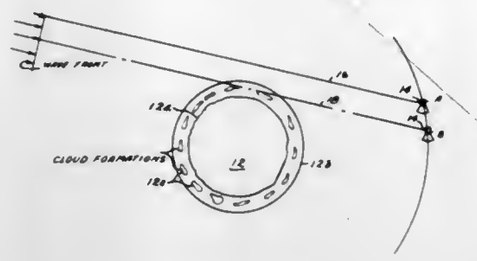
1. An apparatus for cutting fabrics, especially on the bias, comprising; a table having a horizontal top over which the fabric can be moved in the direction of its length, vertical pivot means stationarily mounted adjacent the table at one side of the table, a beam pivotally supported on said pivot means and extending horizontally over said table top, cutter means moveably guided along said beam for horizontal movement on the beam in the direction of the length of the beam and operable to cut fabric on said table top in the direction of the length of said beam, said beam being swingable in a horizontal plane on said pivot means to such an operative angle as to dispose the free end of the beam which is at the end thereof opposite said pivot means within the lateral limits of said table top, a carriage moveable adjacent the table on the side thereof opposite said pivot means, and means supportingly connecting the end of the beam opposite said pivot means to said carriage.



3,274,878
APPARATUS FOR MOUNTING PIERCING PUNCHES
John Calisto Vecchi, Natrona Heights, Pa., assignor to Oberg Manufacturing Co., Inc., a corporation of Pennsylvania
Filed Oct. 23, 1964, Ser. No. 405,942
1 Claim. (Cl. 83—698)

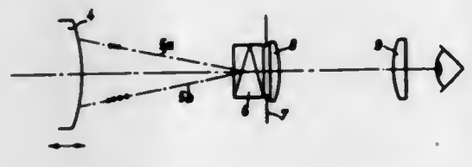
In a punch holder and punch block for mounting a plurality of piercing dies having cylindrical body portions with grooves disposed in a cylindrical bore of said

block, means for securing said piercing dies in said block and holder, said piercing dies having shaped cutting faces and having a flat side in fixed relation to the shapes of the cutting faces, and said punch holders having a slot common to a plurality of dies, the walls of which constitute flat body portions for engaging the flat side of said piercing dies to maintain alignment of the cutting faces relative to the punch holder and shaped faces of other piercing punches mounted in said holder.



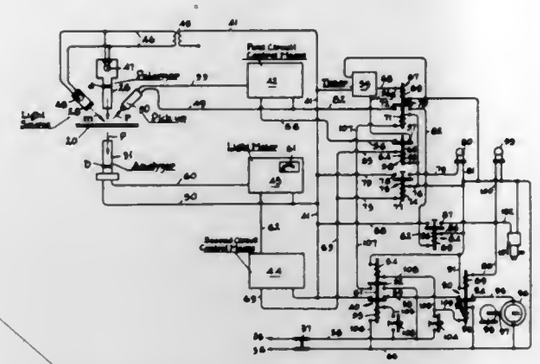
3,274,879
SELF-LOCKING CLEVIS PIN
Harry S. Poller, Moab, Utah, assignor of sixty percent to Atlas Corporation, New York, N.Y., a corporation of Delaware
Filed Dec. 24, 1964, Ser. No. 421,166
7 Claims. (Cl. 85—5)

1. A self-locking clevis pin, comprising
a shank having a portion of reduced diameter adjacent one end thereof,
an enlarged head at the opposite end of said shank for retaining said pin in a receiving hole in structure separate from the pin, said head being configurated for convenient grasping and pushing or pulling and turning simultaneously so the pin can be inserted in or extracted from the receiving hole; and a pair of stiffly flexible, resilient and non-retractable fins projecting oppositely from the reduced portion of said shank laterally of said reduced portion but within the length threof, the material of said fins being adapted to flex laterally of the fins and to wrap around the pin and said fins extending outwardly from the pin a distance adapted to securely latch the pin in the receiving hole without overlapping or exceeding in diameter the unreduced portion of the shank when wrapped around the reduced portion thereof during insertion and extraction of the pin in and from the receiving hole, the corners of each fin being curved as shoulders to insure effective resistance to axial forces but substantially minimum resistance to rotational and axial forces applied simultaneously to said pin, and the edges of the fins extending transversely to the shank being formed with reverse curves thereon, said reverse curves beginning adjacent to the shank and joining the curves of the corners.



3,274,880
METHOD AND APPARATUS FOR OCCULTATION DETECTION FOR SPACE NAVIGATION
Robert L. Lillestrand, Minneapolis, Minn., William M. Hilt, Dayton, Ohio, and Daniel C. Harrington, Minneapolis, Minn., assignors to Control Data Corporation, Minneapolis, Minn., a corporation of Minnesota
Filed Jan. 31, 1963, Ser. No. 255,295
5 Claims. (Cl. 88—1)

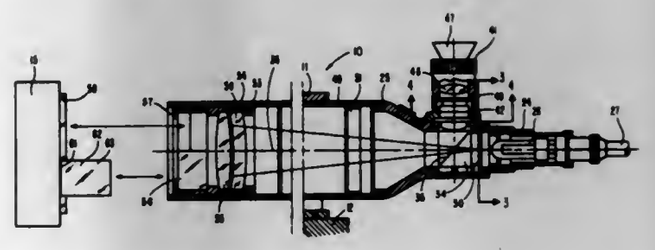
1. A method of determining the time of ingress of a star behind a first body in space as viewed from a second body in space comprising the steps of generating and recording the level of a signal proportional to the intensity of radiant energy received from the star through an aperture of a given area when the path of radiation is clear of the first body and any atmosphere thereabout, increasing said aperture area by a predetermined percentage of area by removing radiation blocking means, and generating a triggering signal when the signal attenuates



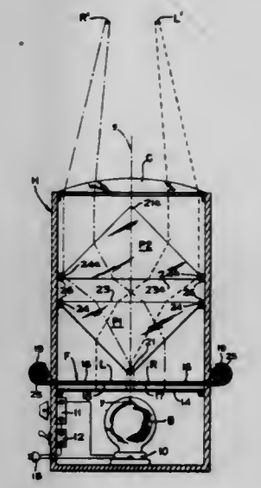
to a value having a predetermined relation to said recorded signal as the first body intercepts the path between the star and the second body.

3,274,881
COMBINED VIEWFINDER AND RANGEFINDER WITH COMPOSITE BIREFRINGEMENT PRISM ASSEMBLY FOR PHOTOGRAPHIC CAMERAS
Hans Sauer, Heidenheim (Brenz), Germany, assignor to Carl Zeiss, Oberkochen, Wurttemberg, Germany
Filed Nov. 30, 1961, Ser. No. 156,037
Claims priority, application Germany, Dec. 6, 1960, Z 8,411; Feb. 24, 1961, Z 8,574
3 Claims. (Cl. 88—2.6)

1. A combined viewfinder and rangefinder for photographic cameras, comprising a finder objective, an image inverting system, and an eyepiece lens forming an optical system with an optical axis along which said objective is movable, a beam combiner arranged on the optical axis between the objective and the image inverting system, said beam combiner being composed of three triangular shaped prism elements arranged in contact in alternate opposed relation, of which at least two consist of optically double refractive material with their optical axes normal to the axis of the optical system and angularly displaced one from the other 90°, said triangular prisms being arranged so that the outer walls of the outermost prisms extend in parallel relation and perpendicular to the axis of the optical system, said beam combiner being located on the optical axis at a position encompassing the focal plane of the finder objective, said beam combiner being operative to deviate image rays forming two partial ray paths from opposite lateral portions of the finder objective into coincidence when the finder objective is properly focused, the coincidence focal plane of the beam combiner being perpendicular to the optical axis, the partial ray paths being symmertical to the optical axis and having an included angle of at least 5°, at least one polarizer located on the optical axis adjacent the eyepiece focal plane, covering the entire eyepiece image and oriented to block the polarized light component of one partial ray path and transmit the polarized light component of the other partial ray path and a birefringent element of reduced size combined with said polarizer and disposed adjacent the side of the polarizer facing the incoming light rays and producing a phase retardation of $\lambda/4$ in the path of the light rays to define a reduced coincidence image rangefinding area.



3,274,882
INSPECTION APPARATUS FOR TRANSPARENT GLASS SHEETS
Arthur E. Krieger, Toledo, and Kenyon E. Golding, Waterville, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Filed Sept. 15, 1960, Ser. No. 56,273
7 Claims. (Cl. 88—14)

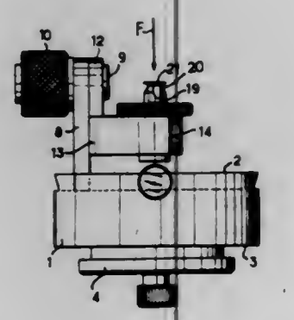


1. An inspection apparatus for transparent glass sheets, comprising a conveyor for supporting and moving a sheet forward along a substantially horizontal path, a light source for directing a beam of light at an angle on a sheet, a light pick-up unit for receiving the light beam from the light source which is reflected from the sheet, polarized light emitting means positioned at one side of the sheet between the light source and the pick-up unit and an analyzer for receiving polarized light rays from said polarized light emitting means positioned at the opposite side of the sheet in alignment with said polarized light emitting means, a timer for producing a signal after a predetermined time lapse, first circuit control means electrically connected with and interposed between the light pick-up unit and the timer and operable to activate said timer when energized by said light pick-up unit in response to the light reflected from the sheet, a motor for driving said conveyor, normally open switch means electrically connected with and interposed between the motor and the timer, said switch means closing in response to said signal from said timer to halt the operation of said motor, a second circuit control means, a light meter electrically connected with and interposed between said second circuit control means and said analyzer and operable to energize said second circuit control means when a predetermined amount of polarized light passes through said sheet and is received by the analyzer, a normally closed switch electrically connected with the second circuit control means and interposed between the first circuit control means and the timer, said normally closed switch being opened to break the circuit to said timer upon energizing of said second circuit control means by said light meter thereby de-activating the timer to allow continued operation of the motor, said second circuit control means being inoperable when insufficient polarized light passes through the sheet to said analyzer permitting continued operation of said timer.

3,274,883
OPTICAL ANGULAR ORIENTATION MEASURING SYSTEM
Richard W. Kern, Vestal, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Mar. 15, 1961, Ser. No. 95,898
7 Claims. (Cl. 88—14)

1. An optical system for establishing the angular orientations of a physical object with respect to three mutually perpendicular axes comprising, in combination: an auto-collimating optical means and an ancillary optical means, said auto-collimating optical means comprising a collimator lens system, an optical object positioned in a focal plane of said collimator lens system, a source of light illuminating said optical object, a beam splitting prism positioned between said optical object and said collimator lens system and adapted to intercept the light from the source, a reticle positioned in a focal plane of said collimator lens system and receiving a portion of the light passing through said beam splitting prism after said light has passed through said collimator lens system, said physical object being positioned in spaced relation with respect to said collimator lens system, a first reflective surface on said physical object for reflecting at least a portion of the collimated beam of light passing from said collimator lens system to provide a first reflected image of said optical object on said reticle, the location of said first reflected image relative to said reticle providing information concerning the orientations of said physical object about two of said axes, said ancillary optical means comprising means for deflecting a portion of said collimated beam of light passing from said collimator lens system through an angle of deviation, and a second reflective surface carried by said physical object disposed to intercept the deflected collimated beam, said second reflective surface reflecting said intercepted deflected beam in a predetermined manner to cause the beam so reflected to be directed back into said collimator lens system, said ancillary optical means providing a second reflected image of said optical object on said reticle, and the relative disposition of said second reflected image containing information concerning the angular orientation of said physical object about the third of said axes when compared with said first reflected image.

3,274,884
STEREOSCOPIC FILM VIEWING APPARATUS
Charles H. Sortor, Fresno, Calif., assignor to FMC Corporation, a corporation of Delaware
Filed May 29, 1961, Ser. No. 113,189
2 Claims. (Cl. 88—29)



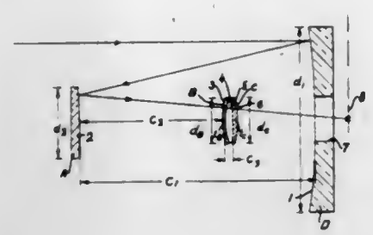
1. Apparatus for viewing stereoscopic photographic scenes having adjoining edges and disposed in the order in which they were exposed in the camera, comprising

means for supporting adjoining scenes for viewing, means for illuminating the scenes, means for crossing the beams of light emanating directly from the scenes comprising a pair of prisms, said prisms forming isosceles triangles having coplanar apices, the planes of the bases of said prisms being spaced from but parallel to one another, the apices of said prisms lying in a plane that substantially intersects the midline between the scenes, and a single converging lens facing the apex of the prism that is remote from said scene supporting means, said scene supporting means being inside of the principal focus of said lens, said lens forming virtual images of the crossed beams of light emanating directly from the scenes in order that the scenes can be viewed stereoscopically.

3,274,885
INSTRUMENTS FOR CHECKING CORNEAL LENSES

Pierre Michel Rocher and Claude Gabriel Thomas, Saint-Maur, France, assignors to Lentilles Ophtalmiques Rationnelles, Paris, France, a corporation of France

Filed Nov. 30, 1962, Ser. No. 241,374
Claims priority, application France, Jan. 9, 1962, 884,261
1 Claim. (Cl. 88—56)



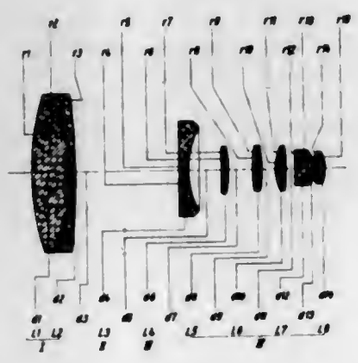
For use with a microscope having a viewing axis, an instrument for checking corneal lenses by permitting the rim of a corneal lens to be observed with said microscope, said instrument comprising a support, a member mounted on said support for movement about a first axis, a lens carrier mounted for rotation on and relative to said member about a second axis perpendicular to said first axis, said carrier being adapted to support thereon a lens to be observed in such a manner that the optical axis of the lens coincides with said second axis, said first and second axes being spaced apart a distance substantially equal to half the diameter of the lens to be observed, the height of said carrier being such that first axis intersects the rim of a lens in position on the carrier, and said first and second axes being positioned so that said first axis intersects and is perpendicular to said viewing axis of a said microscope and said second axis is swingable about said first axis in a plane which includes said viewing axis of said microscope.

3,274,886
CASSEGRAIN TELE-OBJECTIVE

Seymour Rosin, Massapequa Park, N.Y., assignor to Scanoptic Incorporated, New York, N.Y.

Filed Aug. 21, 1962, Ser. No. 218,319
17 Claims. (Cl. 88—57)

1. A tele-objective comprising, in combination, a primary mirror having a parabolic reflecting surface concave to the front, and being formed with an aperture; a secondary mirror having a spherical reflecting surface convex to the rear and confronting said parabolic reflecting surface, said mirrors being aligned along an optical axis, the diameter of said secondary mirror being smaller than the diameter of said primary mirror; the radius of the entire spherical reflecting surface being equal to the radius of curvature of the central portion of said parabolic reflecting surface so that said primary and secondary mirrors have the same focal length, the distance between said reflecting surfaces being greater than half of said focal length so that the image plane is located rearwardly of said primary mirror and outwardly of the air space



between said mirrors whereby rays pass through said aperture; and lens means including at least two lens elements located between said mirrors concentric with said optical axis and together having zero power, the distance between said lens means and said spherical surface and the curvature of said lens elements being selected so that spherical aberration, coma and astigmatism are corrected.

3,274,887
FOUR-COMPONENT OBJECTIVE HAVING TWO MOVABLE COMPONENTS

Karl Heinrich Macher, Bad Kreuznach, Rhineland, Germany, assignor to Jos. Schneider & Co., Optische Werke, Bad Kreuznach, Rhineland, Germany, a corporation of Germany

Filed Jan. 16, 1963, Ser. No. 251,921
Claims priority, application Germany, Apr. 6, 1962, Sch 31,267
2 Claims. (Cl. 88—57)

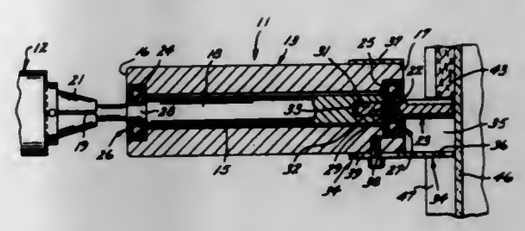
1. An optical objective comprising a biconvex doublet L7, L2 constituting a fixed positive first component I, a lens L3 constituting a negative second component II, a lens L4 constituting a negative third component III, and a fixed positive fourth component IV consisting of a plurality of air-spaced lens members L5, L6, L7, L8; said second and third components being movable, relatively to each other and to said first and fourth components, into a first position in which the objective has a relatively small focal length, a second position in which the objective has an intermediate focal length, and a third position in which the objective has a relatively large focal length; said lenses L1 to L8 having radii of curvature *r*1 to *r*15 and thicknesses and separations *d*1 to *d*14 whose numerical values, based upon a value of 100 units for an intermediate overall focal length, together with their refractive indices n_d and Abbé numbers ν are substantially as given in the following table, with the spacings *d*3, *d*5 and *d*7 given for said second position:

				n_d	ν
I	L1	*r*1 = +290.98	*d*1 = 42.50	1.61772	49.78
	L2	*r*2 = −216.32	*d*2 = 7.50	1.75520	27.53
		*r*3 = −760.07	*d*3 = 115.36	Air space	
II	L3	*r*4 = −7550.72	*d*4 = 10.00	1.62041	60.29
		*r*5 = +101.16	*d*5 = 39.35	Air space	
III	L4	*r*6 = −88.75	*d*6 = 5.00	1.62041	60.29
		*r*7 = −209.77	*d*7 = 27.80	Air space	
IV	L5	*r*8 = +260.02	*d*8 = 10.00	1.52310	50.93
		*r*9 = −172.42	*d*9 = 15.00	Air space	
	L6	*r*10 = +50.80	*d*10 = 12.50	1.74400	44.90
		*r*11 = −575.75	*d*11 = 12.00	Air space	
	L7	*r*12 = −78.31	*d*12 = 13.75	1.74080	28.05
		*r*13 = +31.25	*d*13 = 4.00	Air space	
	L8	*r*14 = +42.03	*d*14 = 15.00	1.67790	55.52
		*r*15 = −59.76	d_{total} = 329.76		

3,274,888
INORGANIC REFLEX-REFLECTIVE AGGREGATE

Robert C. Vanstrum, White Bear Lake, Thomas L. Harrington, St. Paul, and Chi Fang Tung, Lincoln Township, Washington County, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

Filed Jan. 19, 1962, Ser. No. 167,272
11 Claims. (Cl. 88—82)



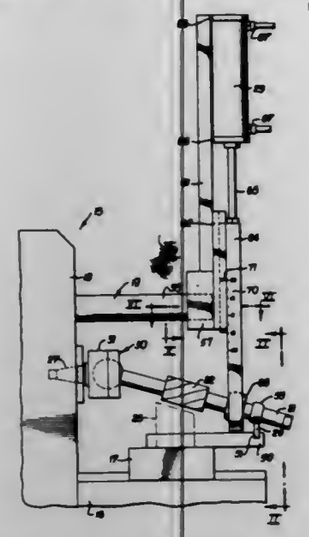
1. All-inorganic weather-resistant and crush-resistant reflex-reflecting freely-flowable aggregate particles comprising reflex-reflecting complexes all of which are in the form of a monolayer thereof completely surrounding and partially embedded in an underlying spheroidal inorganic core having a thickness of glassy material, at least on its outer surface portion, equal to the depth of penetration of said complexes into said core, said complexes each consisting essentially of a glass microsphere having an associated underlying hemispherical specular-reflecting metallic coating, said metallic coating being embedded between the glass of said complexes and the glassy material of said core and serving as a reflector of incident light passing through the microspheres of said complexes as well as an intermediate layer to which the glass of said complexes and the glassy material of said core are firmly bonded, the structure of said aggregate particles being further characterized in that the glassy material of said core has a softening temperature at least about 100° C. below the softening temperature of the glass of said microspheres, and a thermal coefficient of expansion at least about equal to, up to about 100% greater than, the thermal coefficient of expansion of the glass of said microspheres.

3,274,889
ROUTING ATTACHMENT ADAPTER FOR A POWER-DRIVEN HAND DRILL

Wallace A. Ferris, Huntington Park, Calif., assignor to Stamicarbon N.V., Heerlen, Netherlands

Filed May 18, 1964, Ser. No. 368,230
14 Claims. (Cl. 90—12)

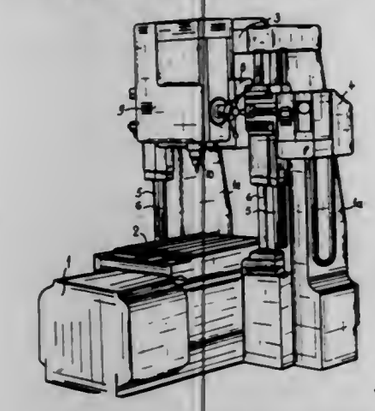
1. A routine attachment adapter for a power-driven hand drill, comprising: a longitudinally apertured longitudinal body member having a rear end and a front end and having a longitudinal bore therein extending through the length thereof from said rear end to said front end thereof; and a longitudinal shaft member rotatively received within and mounted within said bore of said longitudinal body member and having a rear torque-receiving end portion adapted to be engaged and coupled to a torque-applying power-driven hand drill, said longitudinal body member being supported only by said longitudinal shaft member and being physically separate from the torque-applying power-driven hand drill when the hand drill is engaged and coupled to said rear torque-receiving end portion of said shaft member, said shaft member having a forward end effectively provided with a rotary laterally operable cutting tool extending forwardly from the front end of said longitudinal body member; said longitudinal body member being provided with a guide and gauge means adjacent to said rotary cutting tool and cooperable for manually controlled guiding abutment along a solid surface for guiding said cutting tool along a desired cutting path in a direction substantially transverse with respect to the longitudinal direction of said bore, said guide and gauge means comprising a guide tip provided with a mounting and coupling portion for coupling said guide and gauge means with respect to said longitudinal body member for mounting said guide tip in a desired laterally offset guiding relationship with respect to said cutting tool, said guide tip having a planar portion lying in a plane parallel to but slightly perpendicularly displaced from a longitudinal axis of said forwardly extending rotary cutting tool and being positioned in said parallel plane at one side of said cutting tool, thereby effectively providing and defining a laterally open cutting access region on the opposite side of said cutting tool from said planar portion of said guide tip.



3,274,890
UNIVERSAL MILLING MACHINE

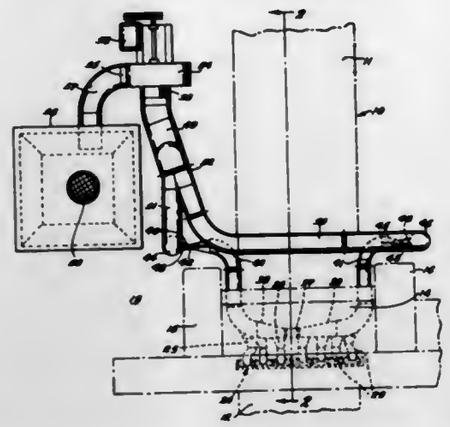
Clarence E. Hills, Los Angeles, Calif. (13512 S. Purche Ave., Gardena, Calif.)

Filed Jan. 14, 1965, Ser. No. 425,562
9 Claims. (Cl. 90—13)



1. In a milling machine for milling surfaces on a work piece in accordance with a preselected configuration provided by a template, the combination of: a base frame; a machine bed on said frame; a machine head on said frame, said head and bed being relatively movable; a rotatable driving shaft carried by said head; an arbor shaft extending over said bed and having a cutting tool thereon; swivel means connecting said driving shaft to

said arbor shaft for rotating the arbor shaft and providing relative angular movement therebetween in a selected



plane; and means slidably connected to the arbor shaft remote from the driving shaft for supporting said arbor shaft during such angular movement.

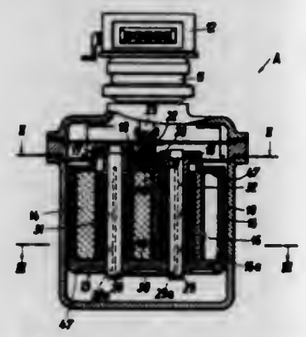
3,274,891
CLOSED-FRAME MACHINE
Germain Rollat, Geneva, Switzerland, assignor to Societe Genevoise d'Instruments de Physique, Geneva, Switzerland, a firm of Switzerland
Filed June 24, 1965, Ser. No. 466,748
Claims priority, application Switzerland, July 1, 1964, 8,649/64
4 Claims. (Cl. 90—16)

1. In a tool-machine, such as a centre-marking, milling or boring machine, or a measuring machine having a closed frame, that is to say, a machine of the type which comprises a movable horizontal crosshead which is parallel to the table of the machine and moves along two vertical columns, being controlled by two vertical screws each located at one end of the crosshead, and a headstock-carrying slide which is movable along the said crosshead, in such a machine, a fixed cam-member, a first feeler carried by the crosshead and movable along the said cam-member during vertical movement of the crosshead, a second cam-member carried by the crosshead and movable under the control of the said first feeler and a second feeler carried by the slide and movable along the said second cam-member during movement of the slide, the said second feeler being adapted to actuate a control mechanism, thereby to operate at least one of the said screws so as to cause it to rotate in one direction or the other, according to the position in height of the crosshead and the transverse position of the slide, and thus to maintain the crosshead parallel to the table whatever the position of the crosshead and of the slide.

3,274,892
DUST CONTROL APPARATUS FOR METAL WORKING MACHINES
Eugene A. Carsey, Cincinnati, Ohio, assignor to The Kirk & Blum Manufacturing Co., Cincinnati, Ohio, a corporation of Ohio
Filed Mar. 30, 1965, Ser. No. 443,908
4 Claims. (Cl. 90—24)

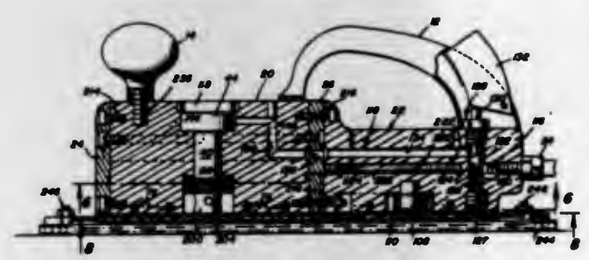
1. Dust collecting apparatus for a metal working machine having a vertically reciprocated cross slide and a traversing tool rest on the cross slide comprising a composite, laterally extending hood mounted on the cross slide alongside the path of the tool slide rest, said hood having a number of side-by-side intake nozzles interconnected at their intake ends, each nozzle having a reduced discharge end, a cross over pipe positioned on the cross slide, said cross over pipe having a lateral row of spaced apart fittings, a pipe connecting the reduced discharge end of each nozzle to a fitting, the intake ends of the nozzles extending laterally the width of the hood and disposed closely adjacent the tool path, a collector stand pipe positioned beside the machine, a conduit connected to the cross over pipe and having a vertically sliding connection with the stand pipe, a filter means, and fan means continuously exhausting the stand pipe into the filter means.

3,274,893
POWER-BOOSTED, PUSH-PULL, CABLE CONTROL APPARATUS
John B. Hurlow, 2616 Welt Parkway, Tacoma, Wash.
Filed Feb. 24, 1964, Ser. No. 346,623
4 Claims. (Cl. 91—49)



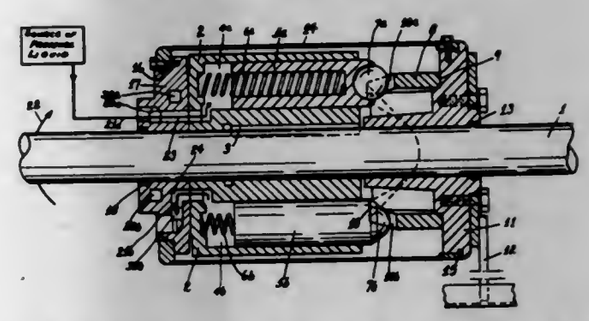
1. For use in power-boosted, push-pull cable control apparatus including input and output push-pull cables, a servo booster cylinder comprising

(a) a hollow case having longitudinally spaced inlet and outlet ports,
(b) a packing ring mounted inside the case between the ports,
(c) a hollow piston mounted for axial movement inside the case and packing ring,
(d) a piston ring on the piston in sliding sealing contact with the inside bore of the case, spaced from the packing ring and at the opposite side of the outlet port,
(e) ports through the walls of the hollow piston on each side of the piston ring,
(f) a hollow valve spool mounted for axial movement within the piston,



(g) spaced inlet ports on one end of the spool adjacent the inlet port through the case,
(h) valve sleeve means mounted inside the piston in working relation to the inlet ports,
(i) an outlet port through the spool between the ports on the piston,
(j) spaced sealing ring means between the piston and spool, one on each side of the outlet port,
(k) and connecting means for connecting the valve spool to the input push-pull cable and the piston to the output push-pull cable.

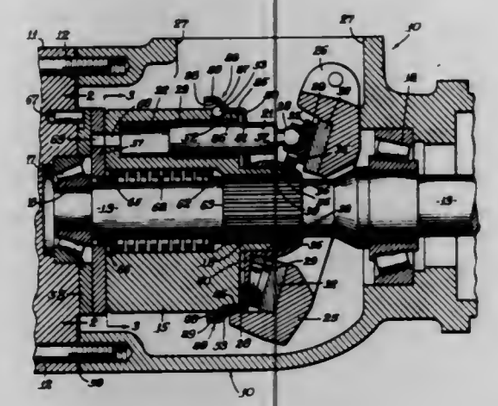
3,274,894
HYDRAULIC APPARATUS
Carl Jünger, Mannheim, Germany, assignor to Bopp & Reuther G.m.b.H., Mannheim-Waldhof, Germany
Filed Jan. 24, 1962, Ser. No. 168,455
1 Claim. (Cl. 91—87)



In a hydraulic apparatus, in combination, a pair of cooperating fluid displacing rotary gears having intermeshing teeth and recesses formed between the adjacent teeth thereof, the whole depth of said teeth being such that, during penetration of a tooth of one of said gears into the mating recess of the other gear, the minimum volume of the space formed between the root of the recess and the tip of the mating tooth is sufficient to permit the fluid contained in said space to form a first stream which is adjacent to the flanks of the teeth bounding said space and a more rapid second stream surrounded by said first stream, said streams flowing in the axial direction of said teeth.

3,274,895
DOUBLE PISTON PNEUMATIC FILING MACHINE
Otto Hendrickson, Azusa, Calif., assignor of one-third to Al Lohbeck, Arcadia, Calif.
Filed Sept. 4, 1963, Ser. No. 306,527
14 Claims. (Cl. 91—179)

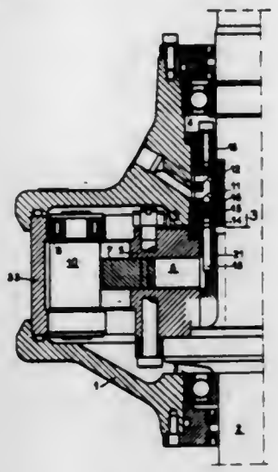
1. A pneumatic filing machine, comprising: a body having cylinder bore means, valve chamber means and combination intake and exhaust passage means therein, said combination means communicating the ends of said cylinder bore means with said valve chamber means; piston means slidingly received within said cylinder bore means and adapted to reciprocate in said cylinder bore means; valve means positioned in said valve chamber means and operably associated with said piston means for alternately admitting fluid under pressure to one end of said cylinder bore means and venting the other end of said cylinder bore means to the ambient atmosphere in response to the reciprocation of said piston means; and tool carrier means closely underlying said piston means, and means drivingly connecting the piston means with the tool carrier means adjacent the front end of the body, said cylinder bore means comprising a pair of parallel juxtapositioned cylinder bores, said piston means including a pair of double ended pistons slidingly received within said cylinder bores, said body and tool carrier means being substantially twice as long as the cylinder bores whereby the tool carrier means are reciprocated by force exerted at the forward ends thereof.



3,274,896
LIQUID PRESSURE OPERATED MOTOR
Mikko Terho, Naantali, Finland
(% Autolava Oy, Raisio, Finland)
Filed Oct. 7, 1963, Ser. No. 315,427
2 Claims. (Cl. 91—198)

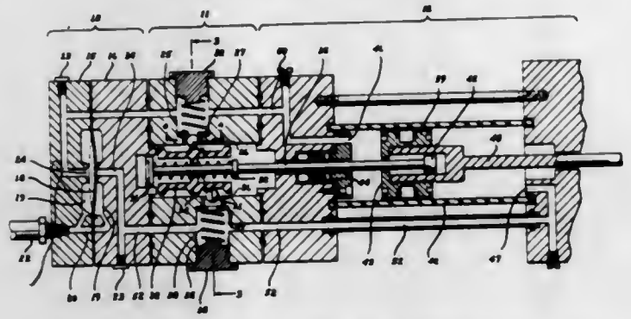
1. A device in which reciprocating motion given a piston by a liquid under pressure is transformed into rotational motion comprising a housing having opposing parallel end walls, one of said end walls having an inner flat bearing surface, a shaft journalled in said end walls perpendicular thereto and to said flat bearing surface, a cylinder block keyed on said shaft in said housing and having an end wall in bearing contact with said bearing surface, said cylinder block being formed with a cylinder bore extending parallel to said shaft, a piston slidably mounted in said cylinder bore, said piston being formed at its end remote from said flat end wall surface with a recess containing a ball, a stationary crown mounted on the other end wall of the housing concentrically with said shaft and formed with inclined cam edges facing said piston along which the ball is movable responsive to force exerted on the ball by the piston, said crown being formed with flattened edges between adjacent pairs of inclined cam edges, said flattened edges being in at least two different planes perpendicular to the shaft axis, said flattened edges alternately comprising crest edges closest to the cylinder block and valley edges farthest from said cylinder block, the inclined cam edges alternating in inclination so that the ball alternately moves along said inclined cam edges toward and away from said cylinder block and travels on said flattened crest and valley edges between such movements to prevent rectilinear movement of the piston, a coiled spring disposed axially in said piston and bearing between said piston and said end wall of the block, urging said block end wall into sealing and bearing contact with said flat bearing surface, urging the piston away from the cylinder block and maintaining the ball in contact with the crown edges at all times, the block end wall having a passage opening at said bearing surface and communicating with the adjacent end of the cylinder bore, said one housing end wall having inlet and outlet passages opening at said bearing surface at locations to at times respectively register with said block end wall passage, means to supply pressure liquid into the cylinder bore through said inlet passage and block end wall passage a short time before the ball starts to move along an adjacent inclined cam edge in a direction away from

the cylinder block, whereby to cause said ball to engage the inclined cam edge, said inclined cam edge exerting a reaction on the piston to rotate the shaft, said block end wall passage moving out of registry with said inlet passage to seal said inlet passage a short time after the ball has reached the next adjacent flattened valley edge, and means to register said block end wall passage with said outlet passage, whereby to exhaust said cylinder bore, a short time before the ball moves off said flattened valley edge and engages the next adjacent inclined cam edge.



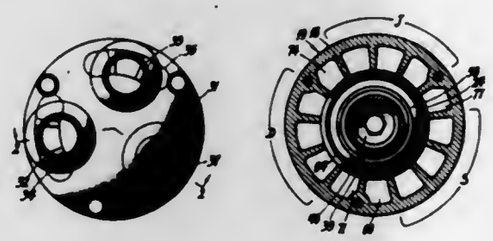
3,274,897
PISTON RETURN MECHANISM
Donald B. Reinke, Rockford, Ill., assignor to Sundstrand Corporation, a corporation of Illinois
Filed Dec. 23, 1963, Ser. No. 332,775
18 Claims. (Cl. 91—199)

1. A hydraulic fluid translation device including a cylinder block, a plurality of pistons with inner ends disposed for reciprocation within cylinders in the block and protruding therefrom at one end of the block, an inclined cam plate facing said one end of said block, a bearing surface on said cam plate, the outer ends of said pistons having bearing means being adapted to slidably follow said bearing surface, means mounting said cylinder block and cam plate for relative rotation, inlet and outlet means communicating successively with ports from said cylinders upon relative rotation of the cylinder block and cam plate, hold-down means engaging said bearing means and movable toward and away from a position retaining said bearing means in engagement with said bearing surface, means urging said hold-down means toward said position responsive to relative rotation of said cylinder block and cam plate and means blocking said hold-down means from movement greater than a predetermined distance away from said position during start-up of said device.



3,274,898
HYDRAULIC MOTOR
Jacques Faisandier, Chatillon-sous-Bagneux, France, assignor to Societe anonyme dite: Societe d'Applications des Machines Motrices, Issy-les-Moulineaux (Seine), France
Filed Dec. 24, 1963, Ser. No. 333,049
Claims priority, application France, Jan. 2, 1963, 920,314
2 Claims. (Cl. 91—205)

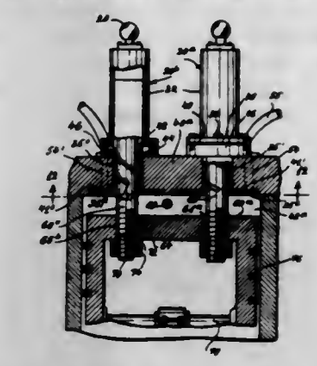
1. A hydraulic motor comprising in combination
a stator,
a rotor mounted in said stator for rotation about an axis of rotation,
a plurality of cylinders disposed in radial arrangement in said rotor,
piston members received in said cylinders,
a reaction member having a surface in said stator for controlling the movement of said piston members in said cylinders, said surface being multi-lobed to impose on said pistons upon rotation of said rotor at least three strokes per revolution,
said rotor comprising a flat valve seat surface disposed perpendicularly to said axial rotation,
an annular valve plate having a flat surface for making contact with said flat surface of said rotor during rotation of said rotor,
a conduit in the rotor for each cylinder discharging at one end into one of the cylinders and at the other end through an orifice of said distributor surface of said rotor and having at least one rectilinear portion in the immediate vicinity of said distributor surface of said rotor,



said valve plate being disposed in a floating manner and having an axis perpendicular to the flat surface of said stator having orifices arranged to sequentially communicate with the orifices of said conduit during rotation of said rotor, a plurality of piston members in said valve plate, each having an axial bore and being engaged partly in a corresponding cavity of the valve plate and partly in a corresponding cavity of the stator, a spring in said cavity of the stator bearing at one end on said piston member and at the other end on said stator, for pressing said valve plate in the direction of said flat surface of the rotor.

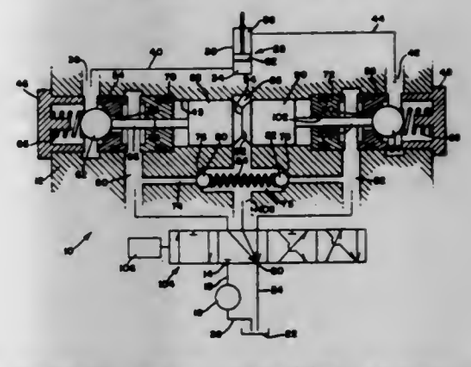
3,274,899
RECIPROCATING FLUID MOTOR
Howard W. Stump, 3339 W. State Ave., Phoenix, Ariz. 85021
Filed Dec. 31, 1964, Ser. No. 422,777
6 Claims. (Cl. 91—265)

1. Apparatus for translating fluid pressure into reciprocating motion comprising:
(a) a pressure box divided into two separate pressure chambers by a flexible diaphragm, (1) each separate pressure chamber having sealable outlet means, (2) said outlet means being sealable by said flexible diaphragm when in contact therewith, (3) each separate pressure chamber adapted to communicate through mainfold means with a source of fluid pressure,
(b) exhaust means comprising a pair of alternately closing exhaust valves communicating with an exhaust vent,
(c) a closed operating cylinder having forward and rear portions, (1) a piston disposed in said cylinder, (2) a forward fluid port in said cylinder forward of said piston, (3) a rear fluid port in said cylinder rearward of said piston,
(d) pressure manifold means connecting one pressure chamber outlet means with one exhaust valve and said forward fluid port,
(e) pressure manifold means connecting the other pressure chamber outlet means with the other exhaust valve and said rear fluid port, and
(f) actuating means operatively communicating between said piston and said exhaust means whereby said exhaust valves alternately close corresponding to the relative position of said piston in said cylinder.



3,274,900
HYDRAULIC MACHINE
Sidney David Hough, 42 Leicester Ave., Glen Waverley, Victoria, Australia
Filed Apr. 3, 1964, Ser. No. 357,238
Claims priority, application Australia, Apr. 4, 1963, 29,214/63
9 Claims. (Cl. 91—298)

1. An hydraulic machine of the type driven by means of pressure fluid and comprising a pair of reciprocatory elements each reciprocable in a bore and each serving as a valve to control the reciprocatory motion of the other; comprising a hollow cylindrical casing and a hollow cylindrical liner located with the casing and spaced therefrom and defining a bore, a plurality of longitudinally extending ribs extending between the casing and the liner to divide the space therebetween to form a plurality of longitudinally extending ducts, and a plurality of ports positioned at predetermined axial and circumferential positions with respect to the bores, each said port providing communication between the bore and a duct according to its circumferential position, wherein at least part of said liner is of complex structure and comprises an outer sleeve and an inner sleeve and a spacer therebetween.

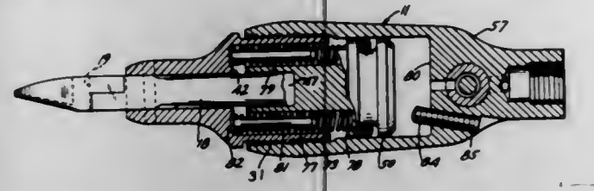


3,274,901
OSCILLATING PORT VALVE
Oscar A. Yost, 302 W. 22nd St., New York, N.Y.
Filed Sept. 28, 1964, Ser. No. 399,715
20 Claims. (Cl. 91—392)

1. A valve assembly for cyclically opening and closing a port in the wall of a structure, comprising a cylindrical sleeve, an annular flange plate extending radially outward of one end of said sleeve and juxtaposable against said wall to cover said port, means for supporting said sleeve for oscillatory rotation on its axis while said plate remains juxtaposed to said wall, and an axially reciprocatable cylindrical valve core extending axially into said sleeve, said core and sleeve having mutually engaging helical threaded means so that the sleeve and plate oscillate rotationally while the valve core reciprocates, said flange plate having an opening at its periphery disposed to uncover and cover said port cyclically as the flange plate

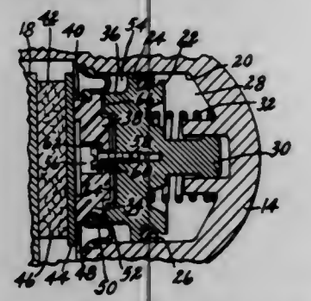
oscillates rotationally while the valve core reciprocates axially.

3,274,902
HYDRAULIC CONTROL SYSTEM
Richard M. Kleckner, Waterloo, Iowa, assignor to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Oct. 22, 1965, Ser. No. 501,249
8 Claims. (Cl. 91—420)



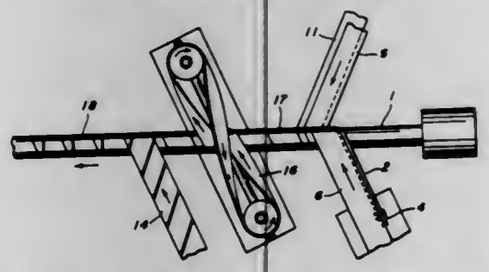
1. A hydraulic system comprising: a source of fluid pressure; a hydraulic motor having alternate inlets; a first and second conduit means respectively connected to said alternate inlets; a control valve means operatively connected to the source of fluid pressure and to said first and second conduit means for selectively supplying fluid under pressure to said conduit means; a first and second check valve respectively mounted in said first and second conduit means between the control valve means and the motor and biased against return of fluid from said motor; a third conduit means interconnecting the first and second conduit means between the control valve means and the first and second check valves respectively; a pair of check valves operably mounted in said third conduit means for preventing the flow of fluid from the third conduit means to the first and second conduit means respectively; and hydraulic means actuated by fluid pressure between the check valves in the third conduit means to unseat the first and second check valves.

3,274,903
PISTON MOTOR
Howard R. Fischer, New Hartford, Livio F. Marcantonio, Utica, and Marcel P. D'Haem, New Hartford, N.Y., assignors to Chicago Pneumatic Tool Company, New York, N.Y., a corporation of New Jersey
Original application Oct. 26, 1961, Ser. No. 147,956, now Patent No. 3,177,583, dated Apr. 13, 1965. Divided and this application Feb. 2, 1965, Ser. No. 429,768
2 Claims. (Cl. 92—13)



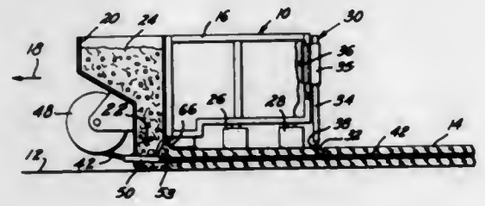
2. A pneumatic reciprocating motor comprising a cylinder providing a piston chamber opening through the front end of the cylinder, a cylinder head screwable into the front end of the cylinder for a selective distance, the piston having an extension projecting forwardly and being axially slidable within the cylinder head, the piston

extension having a plurality of longitudinal grooves in its outer surface, the cylinder head having in its interior surface a plurality of longitudinal grooves, each registering with and complementing an associated groove on the piston extension, a plurality of helical compression springs, each disposed in a pair of said complementary grooves and interposed between the piston and cylinder head to



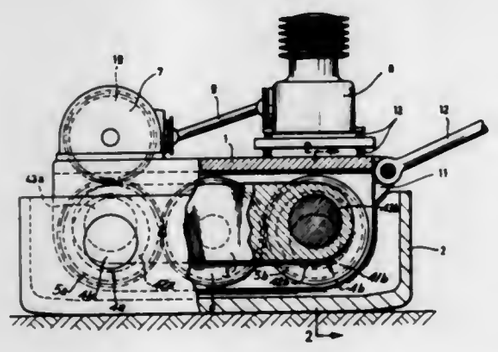
urge the piston rearwardly, fluid pressure means for moving the piston forward with sufficient force to overcome the opposition of said compression springs, a slot in the piston extension, and means carried by the cylinder head removably engageable with the slot to enable rotation of the cylinder head together with the compression springs and piston as a unit relative to the cylinder.

3,274,904
VENTED BRAKE WHEEL CYLINDER ASSEMBLY
Gerald B. Jacoby, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 30, 1964, Ser. No. 407,723
3 Claims. (Cl. 92—99)



2. A piston assembly comprising a piston having an insulator block secured to one end thereof and passage means in said assembly extending radially inward at the joint between said block and said piston and axially outward through a center portion of said block.

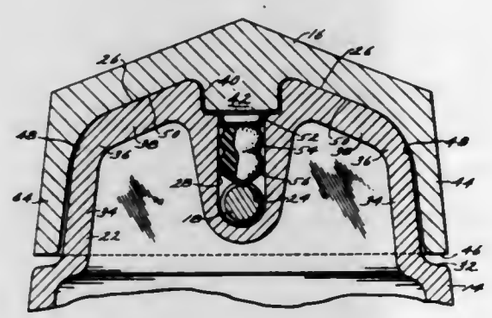
3,274,905
METHOD OF MAKING A COMPOSITE CONTAINER
John N. Demsey, Jr., Murrysville, Pa., and James A. Huber, Cleveland, Ohio, assignors to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 4, 1965, Ser. No. 461,397
5 Claims. (Cl. 93—94)



1. In a method of making a composite metallic foil-paper container, the steps comprising:
(a) spirally winding a metallic foil liner ply over an elongated mandrel;
(b) spirally winding a longitudinally offset paperboard ply over said liner ply with a continuous and coextensive layer of thermoplastic adhesive interposed between said liner ply and said paperboard body ply; and
(c) continuously bonding said plies by elevating the temperature of the composite wrap to the heat sealing temperature of said adhesive.

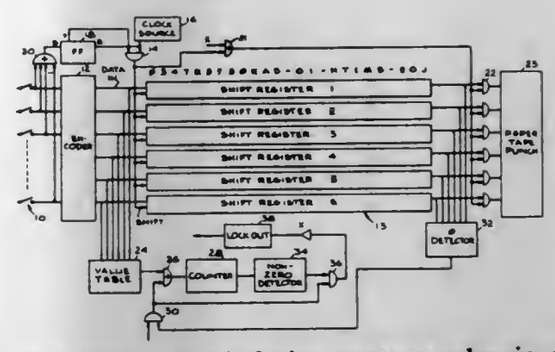
3,274,906
JOINT INSTALLATION APPARATUS
Lee Worson, Long Beach, and Robert F. Dill, Westminster, Calif., assignors to Edoco Technical Products, Inc., Long Beach, Calif., a corporation of California
Filed Dec. 9, 1963, Ser. No. 328,957
5 Claims. (Cl. 94—39)

1. Apparatus for providing a joint in concrete laid upon a prepared base, said apparatus comprising:
a frame movable forwardly over said prepared base;
a smoothing element carried by said frame and having a downwardly and rearwardly directed portion for forcing concrete downwardly;
an elongated joint insert laying tube having a passage for receiving a joint insert and further having a discharge portion spaced immediately below said portion of said smoothing element for discharging the joint insert for embedment in the plastic concrete as said apparatus moves forwardly;
and vibration means for vibrating said smoothing element and said discharge portion whereby plastic concrete passing through the space therebetween tends to consolidate about said discharge portion and about the discharged joint insert.



3,274,907
VIBRATING AND TAMPING DEVICES
Konrad Haage, Esslingen-Kimmichsweiler, Germany, assignor to Heusser-Deimag A.G., Cham-Zg, Switzerland
Filed Aug. 9, 1963, Ser. No. 301,151
Claims priority, application Germany, Aug. 16, 1962, D 39,630
11 Claims. (Cl. 94—48)

1. In a vibrating and tamping device for compacting a mass located beneath the device, in combination, first support means; a pair of rotary crank means, each of said

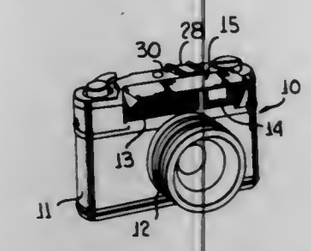


rotary crank means including means for supporting the respective crank means on said first support means; for rotation about a predetermined axis of rotation and first and second crank pins angularly displaced from each other by 180° about said axis of rotation and the axes of said first and second crank pins being respectively parallel to said axis of rotation, said pair of rotary crank means having at any given instant the same angular positions relative to said support means, during operation of the device, so that at any given instant the angular position of said first crank pins with reference to the axes of rotation of the pair of crank means are identical and said second crank pins of said pair of crank means also have respectively with respect to said axes of rotation identical angular positions displaced by 180° about said axes of rotation with respect to the positions of said first crank pins; working plate means operatively connected to said first crank pins for movement therewith and located at the lowest part of the device during operation thereof, said working plate means being the only part of the device which engages the mass which is worked on by the device and said first crank pins rotatably mounted in said working plate means which latter constitutes a second support means; and balancing plate means operatively connected to both said second crank pins for movement with the latter for counterbalancing the movement of said working plate means to eliminate inertia forces, said balancing plate means remaining at all times out of engagement with the mass which is worked on by the device.

3,274,908
TAMPING DEVICE
Gerald E. Grant, East Peoria, and Eugene L. Helton, Peoria, Ill., assignors to Caterpillar Tractor Co., Peoria, Ill., a corporation of California
Filed July 22, 1964, Ser. No. 384,388
5 Claims. (Cl. 94—48)

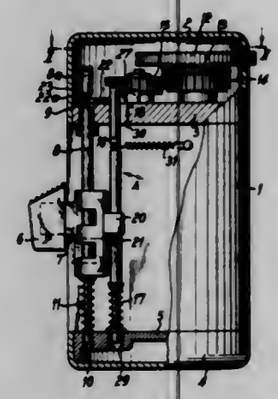
1. A tamping device comprising an elongated support member having a base portion and a projecting portion with inwardly offset side walls terminating at angularly related planar top surfaces, a hollow tamping foot formed to be freely received on said projecting portion and including angularly related planar surfaces which mate in contact with the first mentioned planar surfaces, said tamping foot being formed to substantially enclose said inwardly offset side walls, a retaining member located through axially aligned openings in said projecting portion and in said foot for releasably holding said foot on said support member, said opening in said projecting portion being of sufficient size to allow said retaining member a limited degree of transverse movement whereas the openings in said foot closely receive said retaining member, a detent mechanism located outboard of said opening in said projecting portion including a resiliently biased member engageable with a peripheral portion of said retaining member for urging the angularly mated surfaces on said projecting portion and on said tamping foot in forceable contact.

3,274,909
APPARATUS FOR SPACING CHARACTERS
Markvard Hauerbach, Mountain View, Calif., assignor to A. B. Dick Company, Chicago, Ill., a corporation of Illinois
Filed Aug. 8, 1963, Ser. No. 300,769
6 Claims. (Cl. 95—4.5)



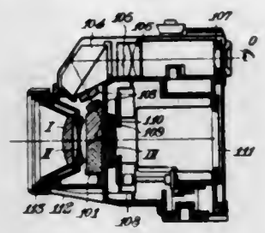
1. In a system for displaying messages wherein each message includes first and last portions and each portion is comprised of a plurality of ordered characters including first and last characters, a display device including a cathode ray tube; means for generating a beam in said display cathode ray tube; means for initially generating a video signal representative of said first character in said first portion and for successively generating video signals representative of subsequent characters in said first portion; means effective concurrent with said generation of said video signal representative of said first character in said first portion for deflecting said display tube beam to a first position and effective concurrent with the generation of each successive video signal for incrementally deflecting said display tube beam in a forward direction toward a second position; means for secondly generating a video signal representative of said last character in said last portion and for successively generating video signals representative of prior characters in said last portion; means effective concurrent with said generation of said video signal representative of said last character in said last portion for deflecting said display tube beam to said second position and effective concurrent with the generation of each successive video signal for incrementally deflecting said display tube beam in a reverse direction toward said first position; a memory storing information defining the space in which each character in said message is displayed; means for summing the space attributable to each character in said message for developing a total character space; means for determining the space difference between said total character space and the total space provided for said message; means determining the number of spacer characters that can be displayed in said space difference; means for successively generating video signals representing said number of spacer characters; and means effective concurrent with said generation of said video signals representative of said spacer characters for incrementally moving said display tube beam through said space between the leftmost character in said second portion and the rightmost character in said first portion.

3,274,910
SUNSHADE FOR CAMERA
Neil S. Williams, 1345 7th St. S., Fargo, N. Dak.
Filed July 14, 1964, Ser. No. 382,457
4 Claims. (Cl. 95—11)



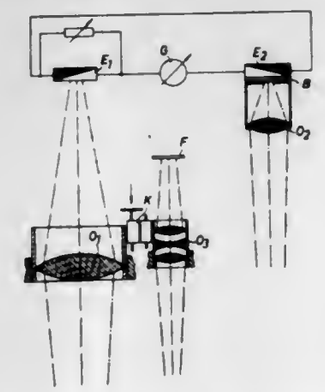
1. A sunshade attachment for conventional cameras of the type having a built-in exposure meter, a sunshade attachment comprising a shade member, said shade member including an upper horizontal shade element, a depending flange at a rear edge of said shade element terminating in an upstanding hook formation, an elongated slot in said depending flange extending lengthwise

of said depending flange, and a support for mounting said shade member on a camera, said support including an elongated arm having a reversely folded forward portion terminating in a depending terminal flange, said arm extending through said slot and said terminal flange being



seated in said hook formation with said reversely folded portion being disposed beneath said shade element, said arm being narrower than said slot whereby adjustment of said shade member transversely of said arm may be accomplished.

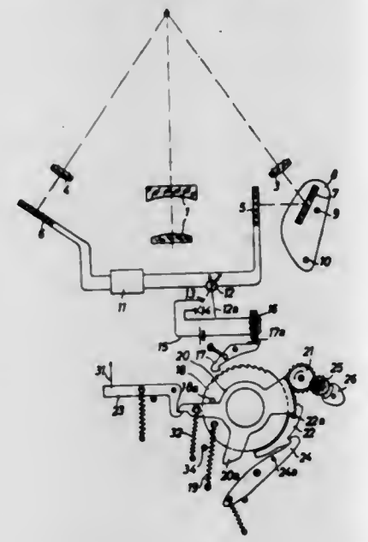
3,274,911
FILM-TRANSPORT AND SHUTTER-RELEASE INTERLOCK MECHANISM FOR CAMERAS
Paul Greger and Heinz Rehn, Braunschweig, Germany, assignors to Voigtlander A.G., Braunschweig, Germany
Filed Dec. 30, 1964, Ser. No. 422,211
Claims priority, application Germany, Jan. 10, 1964, V 25,165
10 Claims. (Cl. 95—31)



1. In a camera, film transport means for transporting film in the camera, shutter release means for releasing a shutter of the camera, releasable film transport lock means having a locking position preventing operation of said film transport means to transport film in a direction displacing unexposed film to a position to be exposed, and said film transport lock means having a release position releasing said film transport means for transporting the film in said direction, and releasable shutter release lock means having a locking position preventing operation of said shutter release means and a release position releasing said shutter release means for operation, said film transport lock means and said shutter release lock means directly engaging each other and said film transport lock means when in its locking position maintaining said shutter release lock means in its release position releasing said shutter release means for operation, said shutter release lock means assuming its locking position when said film transport lock means is in its release position releasing said firm transport means for transporting film in said direction, and said film transport means displacing said film transport lock means back to said locking position thereof at the end of the transportation of an unexposed film frame to a position to be exposed, said film transport lock means, when returning to its locking position, displacing said shutter release lock means to its release position releasing said shutter release means for operation.

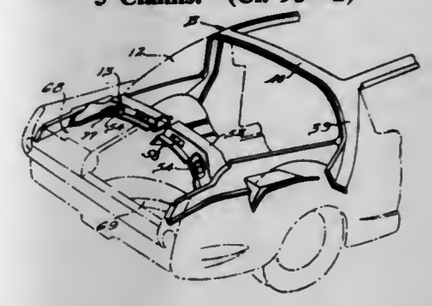
3,274,912
SINGLE-LENS REFLEX CAMERA
Tadashi Kasahara, Tokyo, Japan, assignor to Konishiroku Shashin Kogyo Kabushiki-Kaisha, Tokyo, Japan, a corporation of Japan
Filed Feb. 27, 1962, Ser. No. 176,027
Claims priority, application Japan, Mar. 1, 1961, 36/6,748
6 Claims. (Cl. 95—44)

1. A single lens reflex camera comprising a photographic objective having a large angle field of vision, a diaphragm in front of said objective, two small reflectors in front of said diaphragm and spaced from the optical axis of said camera, and an optical finder system adjacent said objective and diaphragm into which said reflectors reflect a portion of the light entering the camera, said optical finder system having a focusing panel in the real image plane of said finder system with two flat surfaces on the side thereof onto which the light from the reflectors is incident and having the other side spherical, said flat surfaces each being inclined at an angle to the optical axis of said finder system and to each other at an angle determined by the position of said two small reflectors, each surface having an extension extending into the other inclined surface past a line of intersections of said surfaces, said extensions having the edges thereof which are adjacent straight and lying in a plane which includes the optical axis of said finder system and is perpendicular to said surfaces.



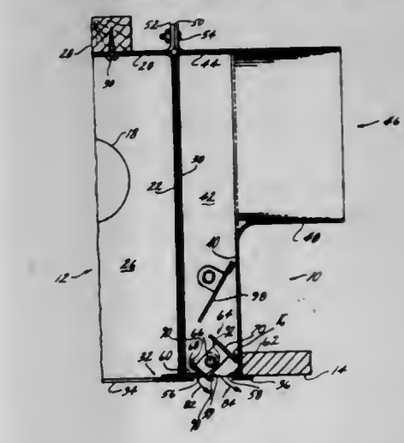
3,274,913
FOCUSING APPARATUS FOR CAMERAS AND THE LIKE
Klaus Biedermann and Franz Jakob, Unterhaching, Munich, Alfred Kubitzek, Grunwald, Munich, and Hans-Peter Simson, Tutzing, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed June 10, 1964, Ser. No. 374,099
Claims priority, application Germany, June 14, 1963, A 43,325
21 Claims. (Cl. 95—44)

1. In a photographic camera, in combination, an objective lens; a focusing arrangement for said objective lens comprising a pair of photoelectric means each including a photo-sensitive element and adapted to create electrical impulses the intensity of which depend on variation of the intensity of the light reaching the respective photo-sensitive element, the photo-sensitive element of at least one of said photoelectric means constructed so as to be adapted



to cause the respective photoelectric means to create different electrical impulses depending not only on the intensity but also the distribution of light reaching said photosensitive element, and means for directing real images of the same object onto both of said photo-sensitive elements, at least one of said means being adjustable for varying the sharpness of the image on at least the photo-sensitive element of said one photoelectric means so that the respective photoelectric means creates electrical impulses which depend in intensity upon variations of the sharpness of the image on the respective photo-sensitive element; and focusing means for focusing said objective lens and being actuated by said combined electrical impulses of both said photoelectric means only when the variations of electrical impulses of said one photoelectric means due to variations of distribution of light reaching the photosensitive element of said one photoelectric means do not coincide with variations of the electrical impulses of the other of said photoelectric means due to variation of distribution of light reaching the photo-sensitive element of the other of said photoelectric means.

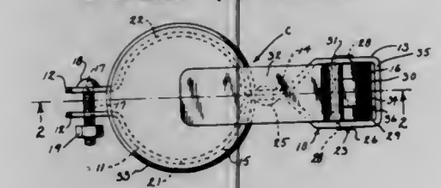
3,274,914
CAMERA FOCUSING DEVICES
Friedrich Biedermann, Günter Fauth, and Franz Jakob, Unterhaching, Munich, Hans-Peter Simson, Tutzing, and Erwin V. Wasielewski, Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed June 10, 1964, Ser. No. 374,116
Claims priority, application Germany, June 21, 1963, A 43,384
26 Claims. (Cl. 95—44)



1. In a range finder, in combination, a pair of optical means respectively situated adjacent the junctions between the base of a predetermined triangle and the sides thereof, said sides of said triangle intersecting distant from said base at the subject and said sides of said triangle respectively coinciding with the optical axes of said pair of optical means; a pair of photosensitive transducers respectively receiving light from beams which extend along said optical axes, said photosensitive transducers constructed and arranged so as to effect the production of equal signals only in response to impingement of identical light beams of equal intensity and equal configuration in identical locations on said photosensitive transducers while in the event of impingement of light beams of unequal intensity and equal configuration in identical locations or of equal intensity and equal or unequal configuration in different locations on said photosensitive transducers the production of different signals will be effected; and means for comparing the thus produced signals for determining their relative characteristics.

3,274,915
VEHICLE BODY INTERIOR VENTILATION ARRANGEMENT
Robert C. Ziegenfelder, Warren, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Filed July 24, 1964, Ser. No. 384,839
5 Claims. (Cl. 98—2)

1. In a vehicle body having an opaque roof section overlying the passenger seating area and a large transparent window panel positioned rearwardly of the seating area, said window panel extending rearwardly and downwardly from said opaque roof section and a trunk area positioned rearwardly of said window panel, a hollow beam member extending transversely of the vehicle body at the rear end of said window panel and supporting same, ventilation ports in portions of said beam member opening into the body interior and other ports in said beam members opening to the atmosphere having valving associated therewith to control the exhaust of air from the body interior across the interior side of said window panel, through the hollow beam member, and outwardly to the atmosphere, an upstanding panel member mounted across the body interior beneath said window to separate the passenger area from the trunk area of the body, and other openings in said hollow beam member opening into said trunk area to provide for exhaust of air from said trunk area through said valved other ports in said hollow beam member.

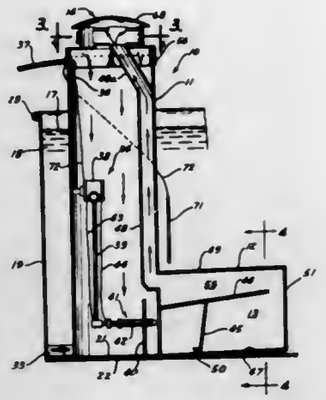


3,274,916
AIR DIFFUSING DEVICE WITH ADJUSTABLE AIR TURNING VANE
William J. Waeldner, Waverly, and Carl W. Palmquist, Clarks Summit, Pa., assignors to Dynamics Corporation of America, New York, N.Y., a corporation of New York
Filed June 16, 1964, Ser. No. 375,490
15 Claims. (Cl. 98—40)

1. A device for controlling the direction of air emanating from an air distribution system; said device comprising first and second longitudinally extending side walls, means for supporting said walls in laterally spaced relationship so that the device can be entered in an elongated opening in a ceiling or the like, first and second air deflecting lips depending inwardly from the lower edge

portions of said first and second side walls and defining an elongated air discharge outlet therebetween, an elongated air turning vane assembly, means pivotally supporting said vane assembly for movement about a longitudinal axis which is spaced between and slightly above said lips, said vane assembly having an elongated vane member located in downwardly spaced radial relation to said assembly axis, and said vane assembly being movable between first and second positions whereat said vane member is positioned in air turning relationship with said first and second lips respectively for the deflection of the air away from the vertical and in opposite generally horizontal directions.

3,274,917
PROTECTIVE COVER FOR EXHAUST PIPES
William P. Tolbert, Sr., Fort Madison, Iowa, assignor to Gleason Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed Feb. 17, 1964, Ser. No. 345,462
6 Claims. (Cl. 98—59)

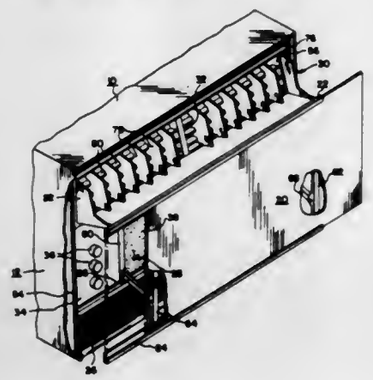


1. An automatic self-closing protective cover assembly adapted to be affixed to the upstanding exhaust pipe of a fuel combustive system to prevent entry of foreign material therein while said fuel combustive system is inoperative comprising; a split ring bracket formed from a single length of heavy gauge metal to include, an open end band portion of a size and configuration to substantially encircle the peripheral surface of said pipe, an open protective cage portion spaced therefrom, and a joining bridge section formed from adjacent parallel stretches of said metal in contacting relationship; a cover normally seated over the discharge end of said pipe closing off the same; a balance arm formed from a single strip of material, means associated with said arm and said protective cage for pivotally mounting said arm intermediate its ends at a point within said protective cage portion, one end of said arm being secured to said cover and forming a support therefor, the other end of said arm extending downwardly and angularly to form a counterbalance for said cover, whereby pressure from exhaust gases will cause said cover to move off the discharge end of said exhaust pipe; means limiting the pivotal movement of said arm; and means for adjustably securing said band portion and bracket to said exhaust pipe.

3,274,918
STOCK TANK HEATER COVER APPARATUS
Mathew H. Stapleton, Jefferson, Iowa
Original application July 9, 1963, Ser. No. 293,744, now Patent No. 3,212,494, dated Oct. 19, 1965. Divided and this application Aug. 23, 1965, Ser. No. 481,834
1 Claim. (Cl. 98—62)

A cover apparatus for a stock tank heater, the heater having a burner box, a heater housing secured to the base of the burner box, and gas burner means mounted within said burner box at the base thereof; said cover apparatus comprising:

a plate adapted to be detachably mounted on the upper end of the burner box and spaced above the normal level upper edge of the burner box whereby air passages are formed between the plate and said upper edge, said plate having an opening formed in a normally horizontally disposed portion thereof, said opening defined by an upturned lip;

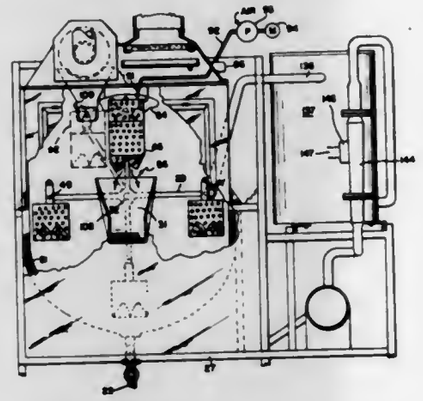


a circular collar member having a plurality of arcuately spaced, depending leg portions mounted on said plate and surrounding said opening, said collar member having a diameter greater than that of said lip but less than the diameter of said plate, said collar member having in addition a plurality of upwardly extended portions formed in arcuately spaced relation about the upper edge thereof;

a cover mounted above and extended over said collar member, the undersurface of said cover concave relative to said collar member, said cover having a diameter greater than that of said collar member; and

an exhaust stack adapted to lead from a position at said upper end of said burner box within said opening to a position downwardly within the burner box, said exhaust stack adapted to have fluid communication with the heater housing as the only fluid exhaust means therefor.

3,274,919
ROOM AIR CONDITIONER
Evert S. Wegman, Columbus, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Feb. 26, 1965, Ser. No. 435,537
6 Claims. (Cl. 98—94)

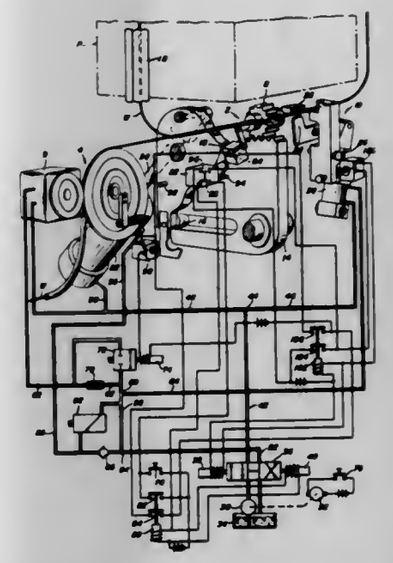


1. A retractable and extendable front panel and vane assembly for a room air conditioner, comprising:

a first frame adapted to be secured to the room face of said air conditioner, and including means dividing said face into a lower air inlet, and an upper air outlet;

a rectangular second frame carrying a closure panel and pivotally linked to said first frame for movement of said second frame from an open lower position in which said panel is spaced outwardly from said air inlet, to a closed upper position in which said panel lies retracted against said room face and over said air outlet;

said vane assembly being generally L-shaped in transverse cross-section with one leg of said L mounting a series of directional vanes, and the other leg of said L carrying a generally imperforate wall, said vane assembly serving as a pivotal link between the upper edge of said second frame and said first frame so that said second frame and closure panel and said vane assembly move between said retracted and extended positions as a unit.



3,274,920
CONTINUOUS DEEP FAT FRYER
John O. Benson, Mayer, Minn., assignor to General Mills, Inc., a corporation of Delaware
Original application Feb. 14, 1963, Ser. No. 258,577. Divided and this application Feb. 12, 1965, Ser. No. 432,089
3 Claims. (Cl. 99—404)

1. A deep fat fryer apparatus for cooking food products in a cooking oil which comprises a container for hot cooking oil; buckets for carrying the products to be cooked; means for moving the buckets relative to said container through an operational cycle of constant duration wherein said buckets are successively charged with products, submerged in the cooking oil, and purged of the products; means for purging said bucket of said products; means for charging said buckets with the products; a power operated timing device interconnecting said means for charging, said means for purging, and said means for moving to effectuate the operational cycle and to drive said means for moving; a heater remotely located with respect to said container for heating said oil; and a circulatory system for continuously circulating the heated oil between said heater and said container.

3,274,921
CONTROL SYSTEM FOR WIRE-TYING APPARATUS
Marchand B. Hall, Olympia Fields, Ill., assignor to United States Steel Corporation, a corporation of Delaware
Filed Feb. 10, 1965, Ser. No. 431,647
6 Claims. (Cl. 100—4)

1. A control system for a wire-tying apparatus including a guide track for the wire, joining means forming a portion of said track, a gripper jaw pivoted adjacent the far end of said means in the direction in which wire is fed through the track, pinch rolls effective to feed wire into said track and on reversal to tension a tie wire about an article within said track, said system comprising a reversible fluid motor driving said pinch rolls, a fluid pressure cylinder connected with said joining means, a fluid circuit connected to said motor and to said cylinder, a reversing valve in said circuit, first means actuating said valve to direct fluid toward said motor, and to said cylinder to operate said cylinder to move said joining means to initial operating position, a full-flow valve in said fluid circuit between said reversing valve and said motor, means for operating said full-flow valve, means operated by completion of the movement of said joining means to initial operating position connected with said full-flow valve-operating means effective to actuate the same to open said full-flow valve after said joining means reaches initial operating position whereby said motor is operated to drive said pinch rolls

in the direction to feed a tie wire through said joining means, around said track and through said joining means a second time, second means actuating said reversing valve to direct fluid to said motor to operate said motor to drive said pinch rolls in the reverse direction to retract said tie wire from said track, and to said fluid pressure cylinder to operate the same to actuate said joining means in a direction to form a joint, a pressure sequence valve in said fluid circuit between said reversing valve and said fluid pressure cylinder adapted to effect operation of said joining means only on the increase of the pressure in said fluid circuit to a predetermined value.

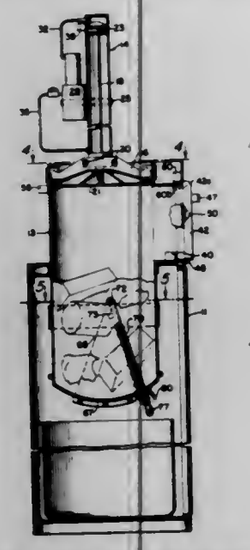
3,274,922
REFUSE COMPACTOR
Lawrence C. Hefner, 519 Avenue B, Redondo Beach, Calif.; Sarah G. Hefner, surviving spouse of said Lawrence C. Hefner, deceased
Filed June 19, 1964, Ser. No. 376,370
7 Claims. (Cl. 100—52)

1. A refuse compactor comprising:

a support frame,

a container fixedly mounted on said frame having a pivotally supported door member covering the bottom end thereof and an access door near the top end thereof,

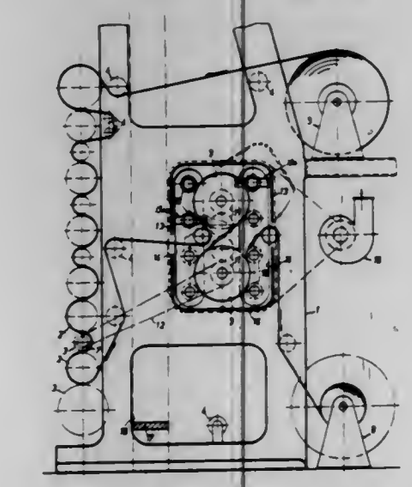
a platen member,



means for slidably supporting said platen member within said container for motion along the longitudinal axis thereof,

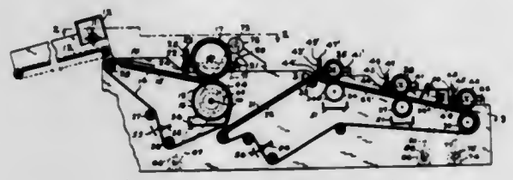
hydraulic drive means for driving said platen along said longitudinal axis, said drive means including a hydraulic pump and a reversible electrical motor for driving said pump,

an electrical power source connected to said motor,



means for maintaining said access door locked when said platten is in other than a predetermined position, and

means for automatically reversing the driving direction of said hydraulic drive when the compacting force applied by said platen exceeds a predetermined magnitude, said reversing means including a pressure sensitive switch responsive to the hydraulic pressure in

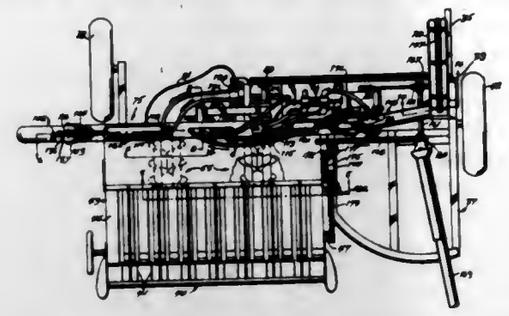


the output of said hydraulic drive means and electrical switch means responsive to said pressure sensitive switch for changing the connections between said power source and said motor to reverse the rotation direction thereof.

3,274,923
MACHINE FOR TREATING PAPER WEBS, ESPECIALLY SATINING OR GLAZING CALENDER
Erhardt Münch, Krefeld-Fischeln, Germany, assignor to Joh. Kleinewefers Sohne Maschinenfabrik, Krefeld, Germany
Filed Aug. 17, 1964, Ser. No. 389,951
Claims priority, application Germany, Aug. 24, 1963, K 45,535
2 Claims. (Cl. 100—70)

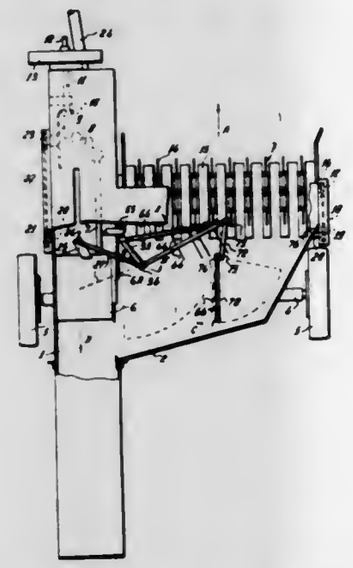
1. In a machine for finishing paper webs, especially for imparting a satin finish to at least one face of a web passing through the machine; roller stand means in the form of spaced frame members, a row of calendering roller means arranged in substantially coplanar relation in the roller stand means at one side of the frame members, paper web supply means and paper web take-up means arranged at the other side of the frame members, and a brushing unit in the roller stand means between the said sides of the frame members and between the ends of said row of calendering roller means so as to have substantially a central location in said roller stand means, said brushing unit comprising a pair of main rollers in adjacent parallel relation, means for driving said main rollers in respectively opposite directions, deviating roller means in the roller stand means including deviating roller means for guiding a paper web therein to and from said main rollers so the paper web can pass around a substantial portion of the periphery of at least one of said main rollers while exposing at least one face of the web for treatment, a plurality of brushing rollers adjacent each main roller and distributed circumferentially thereof about the said portion of the periphery of the pertaining main roller for brushing the face of the paper web exposed on the pertaining main roller, and hood means partially enclosing said main rollers and brushing rollers for conveying air thereover to remove dust generated during the brushing operation, said frame members having aperture means at the ends of said brushing unit exposing the ends of at least said brushing rollers to facilitate servicing thereof, said aperture means also serving as air inlet and air outlet means for said hood means, and air impelling means connected to the aperture means of at least one of said frame members for moving air through said hood means.

3,274,924
APPARATUS FOR DEWATERING PULPY MATERIAL
Douglas Pringle Walker, Rte. 2, Box 160, Mount Vernon, Washington
Continuation of application Ser. No. 312,667, Sept. 30, 1963. This application Nov. 29, 1965, Ser. No. 510,192
10 Claims. (Cl. 100—153)



1. A pulp-dewatering machine comprising a first pair of top and bottom rollers in superposed pressing relationship and rotating in opposite directions, respectively, to provide a feed nip at one side thereof, the top roller being rubber-covered and the bottom roller being of hollow, hard-surfaced construction and perforated, a second pair of top and bottom rollers in superposed pressing relationship located at the discharge side of said first pair of top and bottom rollers and rotating in opposite directions, respectively, to provide a feed nip at the side thereof adjacent to said first pair of top and bottom rollers, both the top roller and the bottom roller of said second pair of rollers being rubber-covered, and water-absorbent belt means passing between the rollers of both pairs of rollers, transporting pulp into the feed nip of the first pair of rollers and also transporting pulp from the discharge side of the first pair of rollers into the feed nip of the second pair of rollers.

3,274,925
VIBRATOR TYPE WAFERIZER
Raymond C. Fischer, Hinsdale, Ill., assignor to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed Dec. 2, 1964, Ser. No. 415,380
26 Claims. (Cl. 100—186)

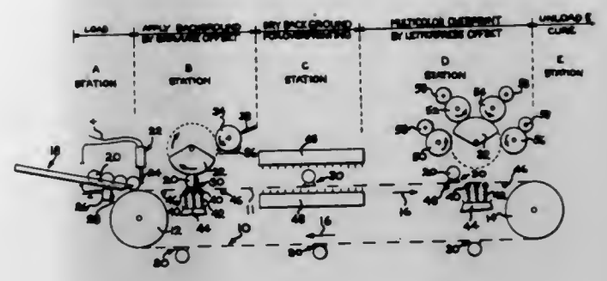


11. A hay waferizer, comprising: a first-stage feeding unit for compacting hay substantially to bale density; a second-stage unit for forming hay wafers, said second-stage unit including a waferizer cylinder, a hay inlet into said waferizer cylinder from said first-stage unit, a waferizer piston in said cylinder, compound drive means connected

to said piston for simultaneously imparting thereto a primary reciprocation and a second reciprocation, said sec-

ondary reciprocation being of greater frequency than said primary reciprocation.

3,274,926
BALING MACHINES
Cornelis van der Lely, Zug, Switzerland, assignor to Patent Concern N.V., Willemstad, Curacao, Netherlands Antilles, a limited-liability company of the Netherlands Antilles
Filed June 26, 1964, Ser. No. 378,269
Claims priority, application Netherlands, July 1, 1963, 294,796
13 Claims. (Cl. 100—188)



1. A feeding device for a baling machine, having a feeding chamber, a system of articulated and pivotable interconnected coupling rods, one end of said system being pivotably connected to a reciprocating baling plunger in a baling chamber, two feed arms in said feeding chamber, each of said arms being pivotably linked to said system about a fixed substantially vertical axis, said arms being spaced from each other and being pivotably connected to each other by said coupling rods, said coupling rods being actuated by said plunger to swing said arms and said arms having crop-engaging means for moving crop material into said baling chamber.

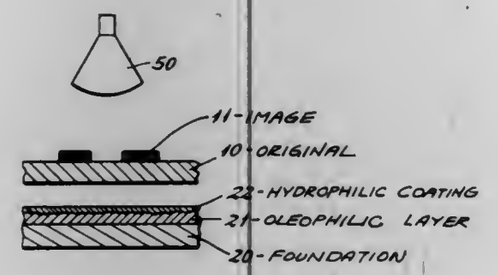
3,274,927
METHOD AND APPARATUS FOR DECORATING CONTAINERS
Kenneth G. Lusher, Perrysburg, and Lowell J. Wells, Toledo, Ohio, assignors to Owens-Illinois, Inc., a corporation of Ohio
Filed June 26, 1964, Ser. No. 378,290
5 Claims. (Cl. 101—40)

1. In a method of decorating an article with a background color having an overprint thereon,

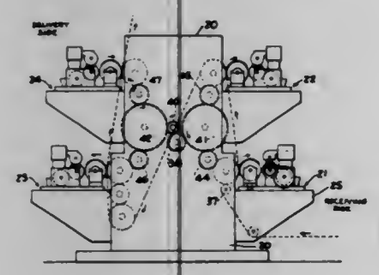
the steps of,
loading the article into a jig and then moving the article along a linear path,
applying a first color to the article by moving a printing medium into printing relation with the article, said printing medium being carried on a member rotating in a manner tending to oppose the linear movement of the article,

exposing the article to radiation to dry said first color, and without removing the article from the jig after the first printing, applying an overprint on the dried first color by an operation wherein the printing medium is carried on a member rotating in a manner tending to oppose the linear movement of the article.

3,274,928
PLANOGRAPHIC PRINTING PLATE
Douglas A. Newman, Glen Cove, N.Y., assignor to Columbia Ribbon and Carbon Manufacturing Co., Inc., Glen Cove, N.Y., a corporation of New York
Filed Dec. 13, 1965, Ser. No. 517,881
10 Claims. (Cl. 101—149.2)



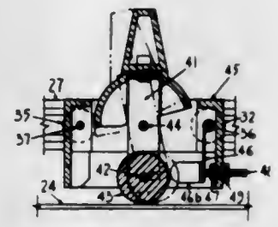
1. A planographic printing plate comprising a foundation, a hydrophilic planographic printing coating on one surface thereof and a volatile liquid-applied pressure-transferable oleophilic layer on the opposite surface thereof, said layer having a dry, clean, rub-resistant surface and being based upon a binder material from the group consisting of cellulosic plastics and synthetic thermoplastic resins and mixtures thereof, and containing oleophilic imaging material for the placing of ink-receptive images on a planographic printing surface under the effects of imaging pressure.



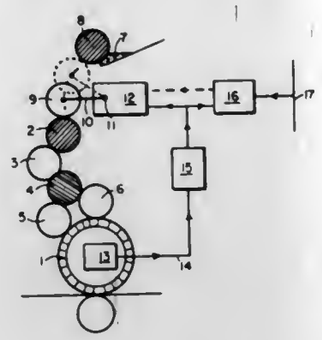
3,274,929
PLANOGRAPHIC PRINTING PLATE AND PROCESSES
Douglas A. Newman, Glen Cove, N.Y., assignor to Columbia Ribbon and Carbon Manufacturing Co., Inc., Glen Cove, N.Y., a corporation of New York
Filed June 13, 1962, Ser. No. 202,188
4 Claims. (Cl. 101—149.2)

2. A heat-imageable planographic printing plate comprising a flexible foundation sheet having on the surface

thereof a heat-meltable oleophilic layer comprising the residue of an aqueous wax emulsion comprising discrete, minute particles of wax, an emulsifying agent and water after the evaporation of said water, said layer having a thickness within the range of from 3 to 5 points, a melting temperature within the range of from 120° F. to 200° F. and having a rough uneven surface providing good receptivity for a hydrophilic printing coating, and having on said rough uneven surface a water-insoluble hydrophilic printing coating comprising 1 part by weight of a hydrophilic binder material and from 3 to 7 parts by weight of an absorbent filler and having a thickness of from 0.5 to 2 points and which is capable of remaining solid and being penetrated and rendered oleophilic by said oleophilic layer when the plate is heated to a temperature within the range of 120° F. to 200° F., said oleophilic layer not being capable of rendering said printing coating oleophilic under the effects of imaging pressure.

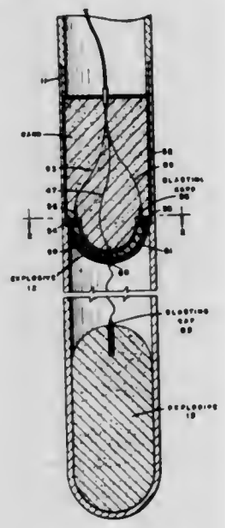


3,274,930
ROTARY PRINTING PRESS WITH MEANS FOR REVERSING CYLINDER ROTATION
Herbert Nagel, Southfield, Mich., assignor to Wolverine Flexographic Mfg. Co., Farmington, Mich., a corporation of Michigan
Filed Sept. 22, 1965, Ser. No. 489,293
6 Claims. (Cl. 101—180)



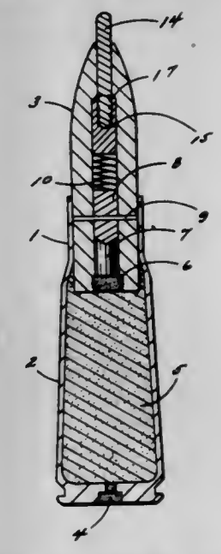
1. In a flexographic rotary printing press for printing a plurality of printing color images on a web, said press to be selectively set to print all of said images on one side of the web and to be selectively reset to print some of said images on the opposite side of the web and thus to print simultaneously on both sides of the web, a plurality of color printing units, each of said units including a plate cylinder carrying a printing plate, an ink transferring cylinder rotatable in either direction and adapted to transfer ink to said printing plate, an impression cylinder adapted to press the web against the printing plate of its respective unit only, the plate cylinder and the impression cylinder of a portion of the plurality of said color units being adapted to be rotated in both directions independently of the cylinders of the remaining units, driving means for rotating the cylinders of the units, means to selectively reverse the direction of rotation of said cylinders in said reversible color units only, roll means for rethreading the web on cylinders of reversible color units for adapting such color unit to print on the opposite side of the web with the other units to continue printing on the same side, clutch means operatively interposed between the plate cylinder and said ink transferring cylinder at least in the reversible color printing units, said clutch means including wedging-in elements adapted to provide driving connection between the plate cylinder and the ink transferring cylinder when the plate cylinder is driven in one direction, said wedging-in elements being responsive to reversing the direction of rotation of the plate cylinder by coming out of their wedge-in positions and thus destroying the driving connection and to provide for idling in the opposite direction, said clutch means being adapted to be manually reset, while remaining in its operative position, when the direction of rotation of its color unit is reversed and when so reset to provide similarly driving connection between said cylinders in the opposite direction and idling in the direction of previous driving.

3,274,931
PRINTING APPARATUS
James MacDowell Patterson, Jr., Springfield, Va., assignor to Farrington Business Machines Corporation, Springfield, Va., a corporation of Massachusetts
Filed June 26, 1964, Ser. No. 378,189
2 Claims. (Cl. 101—269)



1. In the art of printing machines of the type adapted to use portable printing plates, a machine comprising a frame, a tray mounted on the frame at least a portion thereof forming a plane which defines a printing bed, means for positioning on the printing bed printing means to enable an impression to be transferred therefrom, means for positioning on said tray the document to be imprinted, means for providing at least a pair of spaced guide rails above and parallel to the plane of the printing bed, a housing, a pair of shafts extended through said housing, bearings mounted on the end of said shafts and adapted to be directed by said guide rails over the printing bed, a platen head assembly having a handle, a pair of members fixed to and extending from said handle, a shaft with a platen head assembly having a handle, a pair of members fixed to and extending from said handle, a shaft with a platen roller rotatably mounted on said extension members, a rod for pivotally mounting said platen head assembly in said housing, adjustment means for setting the distance to be displaced between the platen roller and the plane of the printing bed when the platen head assembly is rocked into engagement with the adjustment means, said adjustment means comprising means mounted in swivelling fashion from one of the shafts extending through the housing and adapted to abut the extension members carrying the platen roller, screw means threaded through one wall of said housing adapted to abut said swivel mounted means, and means for locking said threaded screw.

3,274,932
INK FOUNTAIN ROLLER INTERRUPTING MEANS
Roger M. Caza, St-Andre-sur-Cailly, Seine-Maritime, France
Filed Dec. 5, 1962, Ser. No. 242,468
Claims priority, application France Dec. 5, 1961
5 Claims. (Cl. 101—351)

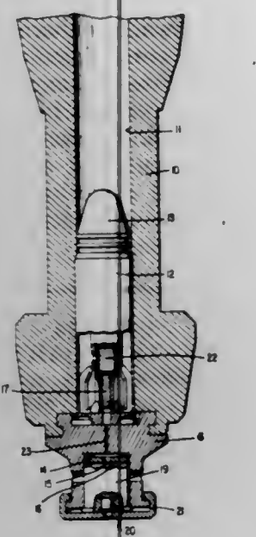


1. In a printing machine having at least a printing drum, an ink fountain roller, an oscillating roller and a ductor roller, said ductor roller rotating in movable levers, the combination of first means insuring a constant rotation speed of said ink fountain roller and second means for a repetitive cyclic operation corresponding to a predetermined rotation of said printing drum, said second means first placing said ductor roller for an adjustable time portion of said cyclic operation into contact with said fountain roller and, second, placing said ductor roller into contact with said oscillating roller during the rest of said cyclic operation.

3,274,933
APPARATUS FOR EXPLOSIVE CHARGE DRILLING
Leon H. Robinson, Jr., and Robert H. Friedman, Houston, Tex., assignors, by mesne assignments, to Esso Production Research Company, Houston, Tex., a corporation of Delaware
Filed May 24, 1963, Ser. No. 284,775
4 Claims. (Cl. 102—21.6)

1. Apparatus for use in earth drilling, comprising:
an elongated housing;
nondirectional first explosive charge means at the lower end of said housing;
a thin cup-shaped supporting member positioned in said housing above said explosive charge means, extending outwardly from the axis of said housing and upwardly and away from said explosive charge means;
a second explosive charge means lining the inner surface of said supporting member;
first detonating means connected to said first explosive charge means;
second detonating means connected to said second explosive charge means adapted upon activation thereof to detonate said second explosive charge means a predetermined interval after activation of said first detonating means and before the energy produced by detonation of said first explosive charge means reaches said second explosive charge means; and
means for simultaneously activating said first and second detonating means.

3,274,934
COMBINATION CARTRIDGE
Philip E. Johnson, Malden, Mass., assignor of fifty percent to Michael C. Lessa, Wakefield, Mass.
Filed Nov. 13, 1964, Ser. No. 411,054
5 Claims. (Cl. 102—38)

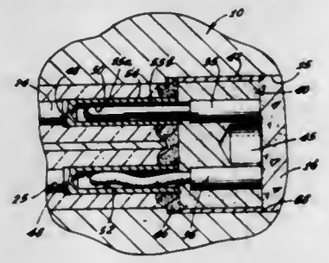


1. An ammunition cartridge of the class described, a cartridge having a generally tubular casing having an open end and a closed end, a cartridge primer inserted in said closed end, a propellant within said cartridge in structural and functional contact with said cartridge primer, an elongated projectile having forward and rearward ends, said rearward end extending in said cartridge casing and closing said open end of said casing, said projectile having a longitudinal bore extending entirely through said projectile, a projectile primer closing said bore at the rearward end of said projectile and in structural and functional contact with said propellant, a firing means within said bore extending forwardly of said forward end of said projectile, shearing means connecting said firing means to said projectile, said firing means when actuated functions to actuate said projectile primer which in turn actuates said propellant, said propellant being alternatively actuated by said cartridge primer or said projectile primer.

3,274,935
PRACTICE AMMUNITION
Hans Stadler, Nurnberg, and Heinz Gawlick and Rudolf Stahlmann, Furth, Germany, assignors to Dynamit Nobel Aktiengesellschaft, Troisdorf, Germany
Filed Aug. 12, 1964, Ser. No. 408,711
Claims priority, application Germany, Aug. 13, 1963, D 42,233
20 Claims. (Cl. 102—41)

1. A practice ammunition, especially for mortars, comprising:
a shell dummy provided with inset barrel means and having a tail portion,

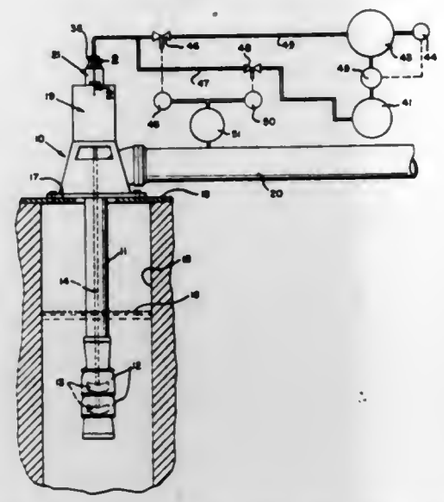
ejector charge means located within said tail portion and ignited during loading of the mortar,



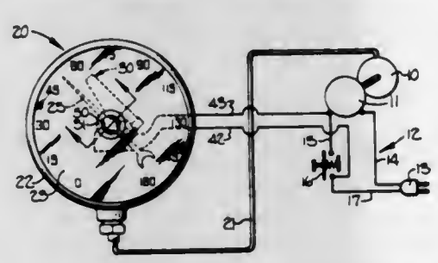
a small-caliber training shell accommodated within said inset barrel means and including propellant charge means,
and means for igniting said propellant charge means by said ejector charge means.

3,274,936
EXPLOSIVE SPEARHEAD
Salvatore John Messina, Cortaro, Ariz. (4526 E. 20th St., Tucson, Ariz.), and Joseph Herndon Pulliam, 2652 W. Arthur Place, Tucson, Ariz.
Filed Aug. 25, 1964, Ser. No. 391,886
1 Claim. (Cl. 102—48)

An explosive spearhead for use with a round of ammunition having a body portion, an outstanding peripheral ejection flange at one end of said body portion, and a primer at said one end, said explosive spearhead comprising a breechblock, a firing pin carried by said breechblock, an outer barrel of uniform smooth internal diameter carried by said breechblock in circumscribing relationship with respect to said firing pin and having an open end in spaced relationship to said firing pin, a breechblock face slidably received within said outer barrel, an aperture defined through said breechblock face in aligned relationship with said firing pin, spring means normally urging said breechblock face away from said firing pin, and inner barrel of smooth uniform external diameter slidably received within said outer barrel and having a first end juxtaposed to said breechblock face and a second end extending further from said firing pin than said open end of said outer barrel, said inner barrel being slidably removable from the open outer end of said outer barrel and internally dimensioned to receive therein in sliding relationship said body portion of said round of ammunition and replaceable in said outer barrel with said ejection flange engaged between said first end of said inner barrel and said breechblock face and said primer aligned with said aperture in said breechblock face, said inner barrel and said round of ammunition being retained in said outer barrel solely by the snug fitting relation of said inner and outer barrels, said breechblock including an annular cup-shaped portion defining a counterbore, said firing pin being carried within said counterbore with a terminal end of the same extending sufficiently beyond said cup-shaped portion to pass through said aperture on said breechblock face and piercingly engage said primer on movement of said breechblock face toward said breechblock against the urging of said spring means by impact of said second end of said inner barrel with a target, and vent means including aligned apertures in said outer barrel and said cup-shaped portion of said breechblock, connecting the interior of said cup-shaped portion with the atmosphere.



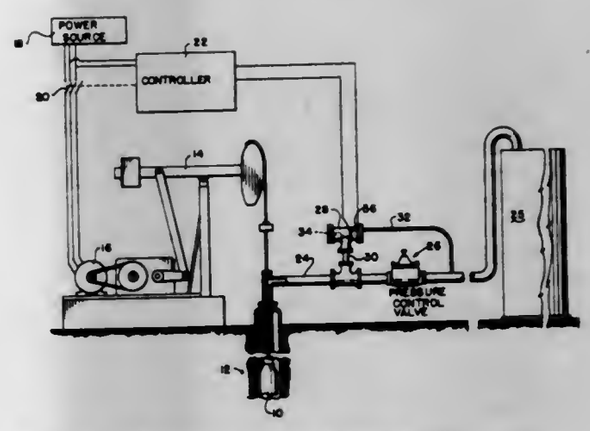
3,274,937
DETONATION SQUIB
James C. Kyle, Glendora, Calif., assignor, by mesne assignments, to Physical Sciences Corporation, a corporation of California
Filed Apr. 11, 1963, Ser. No. 272,384
12 Claims. (Cl. 102—70.2)



10. In a detonation device wherein detonation is accomplished by closing a circuit upon an electrically-responsive explosive element upon the application of a particular voltage to the circuit, the combination of:
a first conductor,
a second conductor having a female portion for receiving the first conductor, and
first ceramic material fused to the second conductor in enveloping relationship to the first conductor,
second ceramic material fused to the first conductor and disposed between the first conductor and the female portion of the second conductor at a position at which the first ceramic material is fused to the second conductor, the second ceramic material being formed by two portions separated by a gap to provide a spark between the first and second conductors and across the gap to obtain a detonation of the device upon the application of the particular voltage through the circuit.

3,274,938
CONTROL APPARATUS FOR ADJUSTING PRESSURE-FLOW CHARACTERISTIC OF A PUMP
Paul B. McCracken, El Cerrito, Calif., assignor to Berkeley Pump Company, Berkeley, Calif., a corporation of California
Filed Oct. 11, 1963, Ser. No. 315,502
6 Claims. (Cl. 103—11)

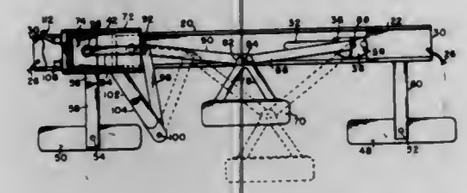
1. In combination, a turbine type pump having an impeller disposed within a pump bowl housing, means for rotating said impeller at a substantially constant speed, actuating means for moving said impeller axially of said pump bowl housing to vary the clearance between surfaces and change the pressure-flow characteristic of said pump, and control means responsive to predetermined operating conditions for energizing said actuating means and adjusting said clearance, said actuating means comprising a hydraulic cylinder, a source of hydraulic fluid, a high pressure line for conducting fluid to said cylinder from said source of fluid, a low pressure line for conducting fluid from said cylinder to said source of fluid, a first control valve disposed in said high pressure line, and a second valve disposed in said high pressure line, and a second control valve in said low pressure line, said control means being adapted for selectively opening and closing said first and second control valves.



3,274,939
MERCURY SWITCH
Charles H. Foster, 211 W. 6th St., Rutherfordton, N.C.
Filed July 29, 1964, Ser. No. 386,089
1 Claim. (Cl. 103—25)

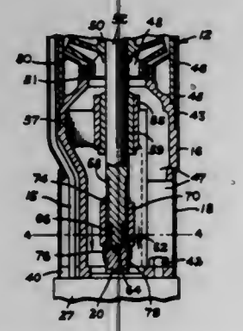
The combination of a pump, motor means for operating said pump, a pressure gage connected to said pump for indicating the output fluid pressure thereof and including rotatable pressure responsive shaft means mounted within said gage and having a pressure indicating pointer mounted thereon, a mercury switch rotatably mounted on said gage shaft means for rotation therewith and operatively connected to said motor means for stopping operation of said pump at predetermined maximum and minimum output pump pressures and for permitting operation of said pump within an operating range of pressures between the predetermined maximum and minimum pressures, said mercury switch being adjustably mounted on said pressure indicating gage shaft means for varying said predetermined maximum and minimum pressures at which said mercury switch will stop operation of said pump, said mercury switch comprising a generally cylindrical elongate body portion containing mercury and having an offset portion therein intermediate the ends thereof defined by a pair of angular downwardly extending and converging bottom walls meeting at a vertex, the included angle between said bottom walls of said offset portion being approximately 108° and thereby providing a range of operating pump pressures corresponding to an arc of movement of about 70° of the pointer of said pressure gage, and a pair of spaced electrical contacts mounted within said offset portion at the vertex thereof, the mercury within said switch being located in said offset portion at the vertex thereof when the output pressure of said pump is within the range of operating pressures to close said switch for operating said pump and being located away from the vertex of said offset portion when the output pressure of said pump is above the predetermined maximum pressure and below the predetermined minimum pressure to open said switch for stopping operation of said pump, and a manually operated switch operatively connected to said motor means in parallel to said mercury switch for operating said pump at any pressure.

3,274,940
CONTROL SYSTEM FOR WELL PUMP
Robert A. Cottrell, Box 4066, Midland, Tex.
Filed Jan. 12, 1965, Ser. No. 424,892
2 Claims. (Cl. 103—25)



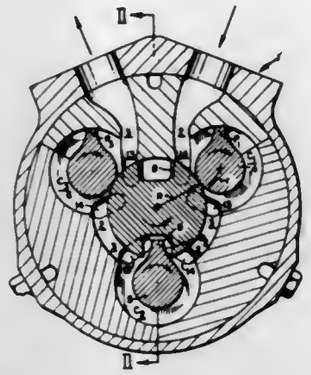
1. An oil well pumping system having
(a) a pump in the well,
(b) a motor drivingly connected to the pump,
(c) a discharge line connected to the pump in the well,
(d) a hydraulic pressure control valve means for maintaining the hydraulic pressure on the pump at a greater amount than the pressure in the discharge line downstream the pressure control valve means when the pump is pumping liquid,
(e) a bypass fluid passageway open at all times connecting the discharge line above stream and downstream of the pressure control valve means,
(f) the bypass fluid passageway being small as compared to the opening through the pressure control valve means,
(g) sensing means attached to the system for determining if liquid displacement from the pump is greater than can be accommodated by the bypass fluid passageway,
(h) means connecting the sensing means to the motor for continuing the operation of the motor responsive to the sensing means determine that the liquid is greater than can be accommodated by the bypass fluid passageway, and
(i) said hydraulic pressure control valve means also functioning as means for maintaining a liquid level in said sensing means when said liquid displacement is greater than can be accommodated by the bypass fluid passageway.

3,274,941
PUMP ACTUATED BY OCEAN SWELLS
Edward L. Parr, 301 N. Cuyamaca, El Cajon, Calif.
Filed Oct. 30, 1964, Ser. No. 407,831
4 Claims. (Cl. 103—68)



1. A pump, comprising in combination:
(A) a frame;
(B) a pair of floats carrying the frame, said floats being spaced from one another at such distance so as to float substantially simultaneously on the crests of swells of the water in the ocean;

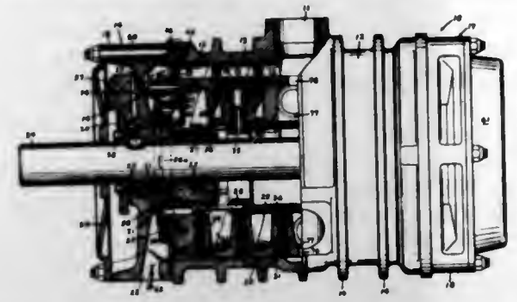
(C) means for retaining the frame in position in which the floats are raised and lowered substantially in unison by the swell movement of the water;
(D) a movable element, connected with the frame, for effecting pumping;
(E) a third float positioned for raising and lowering substantially contra to the movement of the pairs of floats by the swells in the water;



(F) and means responsive to the relative movement between the third float and the pair of floats for moving the movable pumping element;
(G) means for pivotally connecting the pair of floats to the frame;
(H) and means for pivotally connecting the third mentioned float with the movable pumping element.

3,274,942
PUMPS
Kenneth R. Lung, Morehead City, N.C., assignor to The Tait Manufacturing Company, Dayton, Ohio, a corporation of Ohio
Filed Sept. 29, 1964, Ser. No. 400,077
3 Claims. (Cl. 103—87)

1. In a submersible pump including a motor having a submersible casing and a projecting motor shaft having external key means formed on the end portion thereof, an inlet housing rigidly mounted on one end of said motor casing, a pump casing rigidly connected to the other end of said inlet housing, a pump shaft rotatably mounted within said inlet housing and including external key means formed on the end portion thereof, at least one impeller mounted on said pump shaft in spaced relationship with said pump casing, threaded means for connecting said pump shaft to said motor shaft in aligned spaced relationship, and a coupling surrounding the end portions of said pump and motor shafts and having internal key means for engaging said external key means on said pump and motor shafts to provide a positive drive connection therebetween, the improvement comprising means for slidably mounting said coupling on at least one of said shafts to provide for axial shifting of said coupling for disengaging the positive drive connection between said pump and motor shafts without changing said aligned spaced relationship of said shafts so that said pump shaft can be rotated relative to said motor shaft to provide axial adjustment between said shafts for spacing said impeller precisely in relation to said pump casing without disassembling said pump.



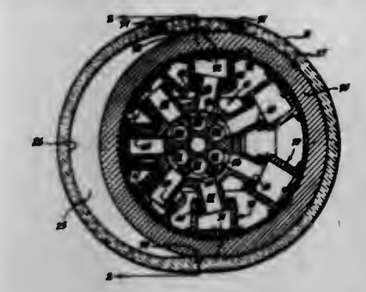
3,274,943
ROTARY POWER DEVICE
Frank Berry, Corinth, Miss., assignor to Differential Hydraulics, Inc., Memphis, Tenn., a corporation of Tennessee
Filed Dec. 11, 1964, Ser. No. 417,578
6 Claims. (Cl. 103—125)

1. A rotary hydraulic power unit of the rotary abutment type comprising a casing having three annular cylinders each having an inlet and an outlet and a rotor shaft carrying a piston rotor with a piston slidably arranged in the cylinder to traverse the cylinder in rotary movement, a rotary abutment arranged in said casing with its axis parallel to the rotor shafts, said annular cylinders being distributed around said abutment shaft and lying in a common plane, said abutment having a pair of recesses to clear each of the three pistons as it passes the abutment, the pistons having a base radius which is one-half the radius of the abutment and the piston rotors rotating in 2:1 relation to the abutment,
(a) the abutment recesses meshing closely with the pistons so that the tips of the pistons substantially close with the edges of the abutment recesses as the pistons pass through the recesses, and
(b) ducts leading from at least one end of the abutment at points which are in communication with the abutment recesses when the pistons are clearing through the recesses, said ducts extending into communication with at least one of said inlets and outlets of the cylinders to accommodate flow of liquid prevented from flowing around around the tips of the pistons by the construction defined in (a) above,
by virtue of all of which the height of the pistons for a given size of unit can be increased without creating objectionable pulsation due to restriction of flow around the piston tips, the increased piston height so accommodated yielding a higher volume of liquid flow per stroke of the pistons.

3,274,944
SCREW VANE PUMP
Frederick L. Parsons, 759 Morningside Road, Ridgewood, N.J.
Continuation of application Ser. No. 436,534, Mar. 2, 1965. This application Sept. 30, 1965, Ser. No. 491,710
14 Claims. (Cl. 103—130)

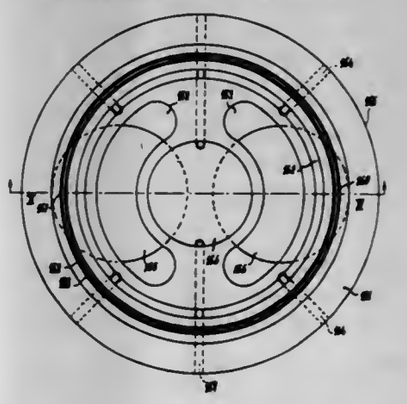
1. Pumps, compressors and the like comprising a casing having an internal cylindrical wall, a drive shaft in said casing concentric with said wall, means in said casing supporting said drive shaft for rotation, an eccentric mounted on said shaft for rotation therewith, a cylindrical rotor in said casing of less external diameter than said cylindrical wall, means resiliently mounting said rotor on said eccentric for gyration in said casing and engagement with said wall, said resilient means urging said rotor against said wall, a generally helical groove in the exterior of said rotor, a helical vane fitting in said groove and engaging said wall throughout substantially the entire length of said vane, said groove being deeper than the width of the vane to enable said rotor to move radially relative to said vane, means positioning opposite ends of said vane relative to said rotor to enable said relative

radial movement between said vane and rotor, an inlet in said casing adjacent one end of said vane and an outlet in said casing adjacent to the other end of said vane.



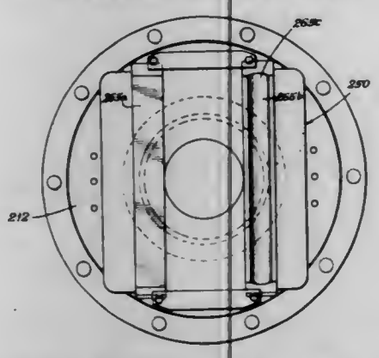
3,274,945
ROTARY VANE MACHINE
Karl Eickmann, 2420 Isshiki Hayama-machi, Kanagawa-ken, Japan
Filed July 2, 1963, Ser. No. 292,217
Claims priority, application Germany, July 6, 1962, E 23,161
9 Claims. (Cl. 103—136)

1. In a rotary vane machine, a machine rotor composed of a central rotor part and a rotor side wall axially on each side of said central rotor part radially projecting therefrom, said rotor having at least one cavity therein extending through said central rotor part and into said rotor side walls, said cavity including at least one slot open at the periphery of said rotor and extending substantially radially along its axial length into said rotor, but terminating in the axial direction within said rotor side walls; and vane means guided in said slot and having a radial extension substantially matching the diameter of said central rotor part so as to be retractible into said cavity in said central part, at least one of the longitudinal walls of said slot having a plane sliding surface limiting said slot and adapted to engage with and to slidingly guide said vane means, at least the axial end portions of said slot extending in radial direction entirely through both said rotor side walls and opening at two points of the peripheries of said rotor side walls.



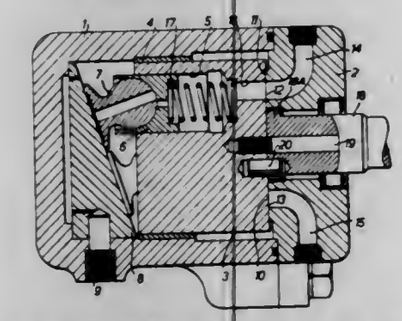
3,274,946
PUMP
Edward E. Simmons, 140 Meridian Hills Blvd., Indianapolis, Ind.
Filed Apr. 13, 1964, Ser. No. 359,336
7 Claims. (Cl. 103—161)

1. A hydraulic pump and motor comprising a housing, a cylindrical race mounted within said housing, a spindle fixed to said housing, a rotor rotatably received on said spindle for rotation within said race about an axis located eccentrically relative to the axis of said cylindrical race, said rotor having a plurality of radial spokes with a radial passage through each of said spokes each of said spokes having a rounded ball shape at its distal end, said spindle having a pair of passages therethrough one of which opens on one side of said spindle and the other of which opens on the other side of said spindle and over both of which said rotor rotates, and cup-like elements each received over a respective spoke and having an outer surface which rides against the inside of said race whereby rotation of said rotor occurs simultaneously with the passage of fluid



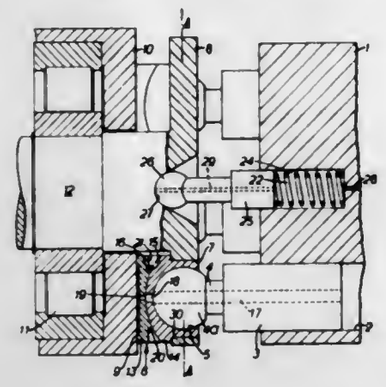
from one of said passages through said rotor into the other of said passages, said cup-like elements being free to expand away from their respective spokes when friction between said race and cup-like elements causes said elements to be heated.

3,274,947
HYDRAULIC PUMP OR MOTOR
Cornelius Otto Jonkers, Delft, and Foppe H. Fockens, Maasland, Netherlands, assignors to C. van der Lely N.V., Maasland, Netherlands, a Dutch limited-liability company
Original application Aug. 31, 1960, Ser. No. 53,289, now Patent No. 3,132,486, dated May 12, 1964. Divided and this application Dec. 31, 1963, Ser. No. 334,814
8 Claims. (Cl. 103—162)



1. A hydraulic pump or motor having a housing with a plurality of chambers each containing a sliding piston, a port plate abutting said housing, said port plate and said housing having abutting surfaces in slidable engagement, said housing and said port plate being rotatable relative to one another about an axis of rotation, said port plate having a first port which forms part of a low pressure fluid duct in said pump and a second port which forms part of a high pressure fluid duct in said pump, said housing and said port plate being movable relative to one another in a direction substantially parallel to said axis of rotation but relatively immovable with respect to one another in directions perpendicular to said axis of rotation, the abutting surface of said port plate being provided with two grooves, the first of said grooves being in constant communication with low pressure fluid by a closed circuit provided in the port plate, one end of which directly communicates with low pressure fluid and the other end of which opens in the first of said grooves, the second of said grooves being in constant communication with high pressure fluid by a closed circuit provided in the port plate, one end of which directly communicates with high pressure fluid and the other end of which opens in the second of said grooves, said grooves being substantially circular in configuration and arranged substantially concentrically.

3,274,948
PUMP OR MOTOR WOBBLER MOUNTING
Stephen S. Baits, Rockford, Ill., assignor to Sundstrand Corporation, a corporation of Illinois
Filed July 2, 1964, Ser. No. 379,821
7 Claims. (Cl. 103—162)



1. A variable displacement hydraulic unit, comprising: a housing member, a valve element having inlet and outlet ports therein, a cylinder block rotatable relative to said valve element and having cylinders therein serially communicable with said ports during said rotation, pistons slidable in said cylinders, a cam member pivotally mounted in said housing; a pivotal mounting for said cam member including two spaced arcuate ways on one of said members, said ways lying generally in a common arcuate plane, spaced shafts mounted on the other of said members each extending over both of said ways, said shafts being spaced apart on a circle defined by the pivotal axis of said cam members, rollers mounted on each of said shafts and engaging said ways, means on one of said ways for preventing relative lateral movement of the rollers engaging said one way, and said other way having a surface permitting relative lateral movement of the rollers engaging said other way whereby only one of the ways defines the lateral position of the came member in the housing.

3,274,949
AXIAL PISTON PUMP OR MOTOR
Oswald H. Thoma, Cheltenham, England, assignor to Hydraulic-Drive A.G., Glarus, Switzerland, a Swiss company
Filed Aug. 10, 1964, Ser. No. 388,529
6 Claims. (Cl. 103—162)

1. An axial piston fluid displacement pump or motor comprising a rotary cylinder block, a connecting shaft secured to said block at one end thereof, said block having three equally spaced parallel cylnder bores closely adjacent to the rotary axis of the cylinder block, such that the pitch circle diameter of the radially innermost parts of the bores is substantially less than the diameter of the connecting shaft where it engages the block, a non-rotary slanting cam disc at the end of said block remote from said connecting shaft, pistons slidable in said bores and engaging said cam disc, a stationary ported valve body at the same end of said block as said connecting shaft, said valve body having an axially directed surface, against which one end surface of the cylinder block bears, and said axially directed surface of the valve body being formed with inlet and outlet control openings to cooperate with ports in said end surface of the cylinder block communicating with each cylinder bore, the center of the ports being displaced radially outwards from the respective centers of the bores in the cylinder block, thus affording an increased central area for attachment of the shaft.

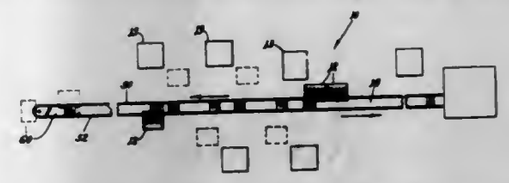
3,274,950
AXIAL PISTON FLUID PUMPS OR MOTORS
Oswald H. Thoma, Cheltenham, England, assignor to Unipat A.G., Glarus, Switzerland, a Swiss company
Filed Jan. 11, 1965, Ser. No. 424,638
Claims priority, application Germany, Jan. 14, 1964, T 25,423
8 Claims. (Cl. 103—162)

1. An axial piston fluid machine having a plurality of generally parallel cylinder bores, pistons slidably disposed in said cylinder bores, a sliding shoe to which each piston is pivotally connected, a rotary drive member which circumferentially and radially locates the shoes with axial or longitudinal freedom of movement, a thrust member having a plane surface which is inclinable relative to the axis of the pistons to transmit axial thrust, the shoes engaging the thrust member, each shoe being formed in at least two parts of which one part is located in the rotary drive member and restrained against circumferential, radial or pivotal movements, and pivotally connected to the respective piston, and another part bears against the plane surface and is pivotally connected to the first part.

3,274,951
RAILROAD TRACK GRIPPING APPARATUS
James W. Christoff, Minneapolis, Minn., assignor to Mannix International Inc., Minneapolis, Minn.
Filed June 10, 1964, Ser. No. 373,925
3 Claims. (Cl. 104—7)

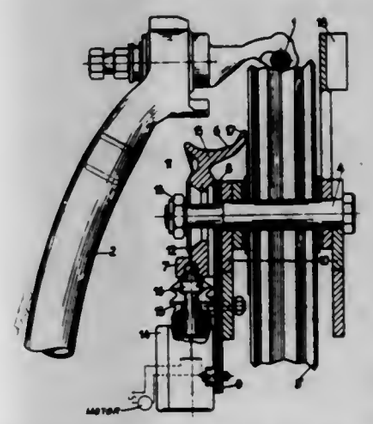
1. Apparatus for travelling along a railroad track while simultaneously lifting a span of said track, the rails of which are joined together by angle bars, comprising:
(a) a vehicle comprising a pair of carts spaced apart along the track and a boom interconnecting said carts,
(b) a lifting frame vertically movably mounted on said boom intermediate said carts,
(c) at least four groups of rail-lifting rollers,
(d) each group comprising a plurality of rollers with at least one roller of the group positioned on each side of a rail of said track,
(e) each roller including a flange portion for supportingly engaging the underside of a rail head,

(f) each group including means for moving the rollers thereof between a closed, rail-embracing condition and an open, rail-releasing condition,
(g) said moving means for each group being operable independently of the moving means for each other said group,
(h) and means mounting all said roller groups on said frame with a pair of said roller groups engaging each rail of the track with said pair of groups spaced from each other in the longitudinal direction of the vehicle with a clear space between the two nearest rollers of adjacent groups on each side of the vehicle greater than the longest angle bar in use on said track, the rollers of a first group of each said pair of groups being movable by said moving means to open condition to avoid an angle bar while the second group of such pair remains in closed condition, so that the side of the track on which such pair is situated remains supported from said lifting frame by said second roller group, the first roller group being recloseable beyond the angle bar to maintain such support from said lifting frame before opening the second roller group to avoid the angle bar.



3,274,952
RAILROAD TRACK GRIPPING APPARATUS
Stephen I. Fekete, Minneapolis, Minn., assignor to Mannix International Inc., Minneapolis, Minn.
Filed June 10, 1964, Ser. No. 374,098
10 Claims. (Cl. 104—7)

1. Apparatus for gripping a section of railroad track, the rails of which are joined together by angle bars, comprising:
(a) a plurality of groups of rail gripping rollers,
(b) each group comprising a plurality of rollers with at least one said roller positioned on each side of a rail structure,
(c) each roller including a flange portion for grippingly engaging the underside of a rail head of said rail structure,
(d) each group including means for moving said rollers between a closed, rail-embracing condition and an open, rail-releasing condition,
(e) said moving means for each group being operable independently of the moving means for each other group,
(f) and detection means associated with each group positioned immediately forwardly and rearwardly of each group for detecting an angle bar on said rail structure,
(g) the detection means for each group being connected to the roller moving means of the same group to actuate the latter on detention of an angle bar to move the rollers to open condition.

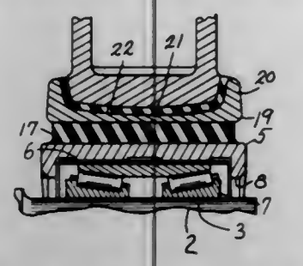


3,274,953
CONVEYOR CONTROL DEVICES
Edward S. Babson, Ipswich, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey
Filed June 2, 1964, Ser. No. 372,059
6 Claims. (Cl. 104—172)

1. A conveyor system comprising a tow chain extending around a direction changing wheel to form separate conveyor runs, a guide plate disposed over said chain shaped to provide a guide ridge and a camming surface in both sides of the guide ridge whereby an article carrying device having chain engaging means and spring biased detent means may be engaged and disengaged with the tow chain by lateral movement toward and away from the chain, said guide plate extending over each run and terminating in spaced relation to the wheel, and a guide cover disposed over the wheel, said cover

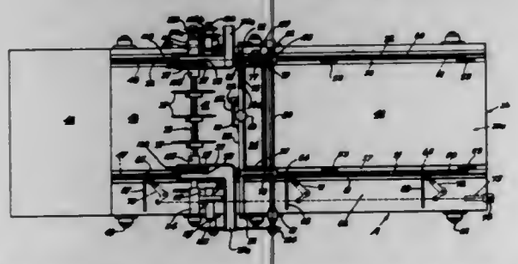
having a retaining rim disposed about a portion of the periphery of the wheel and having ends extending into alignment with the ends of the guide plate, said retaining rim being shaped to prevent lateral movement of the detent means in relation to the rim and being positioned in relation to the wheel to retain the chain engaging means in engagement with the chain.

3,274,954
CABLE OPERATING CONTROL MECHANISM
Emil Doppelmayr, 10 Rickenbacherstrasse, Wolfurt, Vorarlberg, Austria
Filed Apr. 27, 1964, Ser. No. 362,673
Claims priority, application Austria, May 10, 1963, A 3,834/63
11 Claims. (Cl. 104—178)



1. Cable control mechanism for an electrically driven aerial cable comprising a guide roller on said cable, a cable support adjacent said cable guide roller alongside the normal path of the cable for supporting said cable when it slips from said roller, an electric switch in the circuit for the drive of said cable mounted on said cable support, a frame for said roller, said cable support being movably mounted on said frame and relative thereto so that said cable support is able to act directly and independently of oscillations and tilting motions of said cable on said electric switch to stop the drive of said cable.

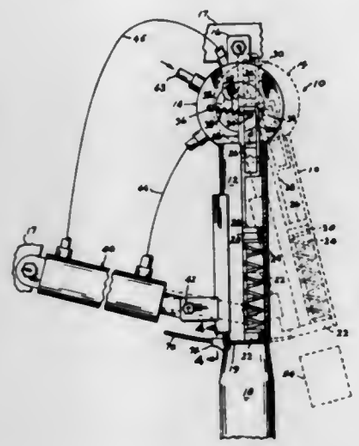
3,274,955
RESILIENT ROLLER BEARING ADAPTER
David G. Thomas, Erie, Pa., assignor to Lord Corporation, a corporation of Pennsylvania
Filed Sept. 3, 1963, Ser. No. 306,009
1 Claim. (Cl. 105—224.1)



In combination with a railway truck frame having spaced pedestal jaws and a railway car journal having a roller bearing between the pedestal jaws, an adapter cap plate between the pedestal jaws recessed on its underside to receive the roller bearing and having end play clearance with respect to the jaws, said frame having a downwardly presented load carrying surface between the upper ends of the jaws and said cap plate having an upwardly

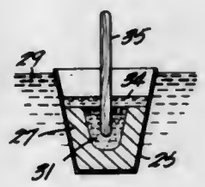
presented load receiving surface spaced below the load carrying surface, a top plate having its upper surface spaced below and presented to the load carrying surface and having upwardly extending flanges straddling said load carrying surface and in end thrust transmitting relation to the frame, said top plate having its lower surface spaced above and presented to the load receiving surface

on the cap plate, a body of elastomer sandwiched between and having lower and upper surfaces respectively anchored to the upwardly presented load receiving surface of the cap plate and to the lower surface of the top plate and carrying the car load in compression and the end play in shear, and a coating of elastomer bonded to the upper surface of the top plate and engaging and conforming to the load carrying surface of the frame.



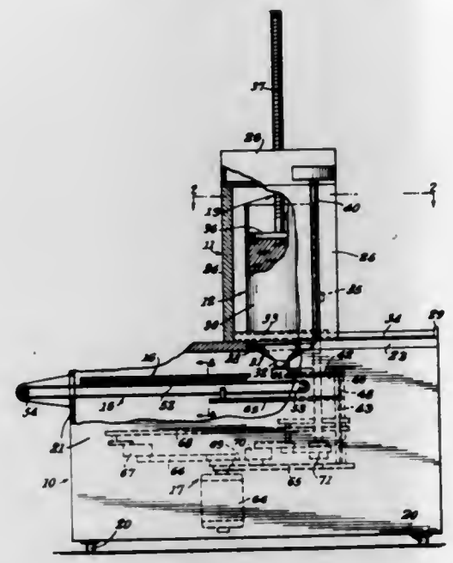
3,274,956
FRENCH ROLL DOUGH PROCESSING MECHANISM
Benjamin R. Francia, 1530 De Anza Way, and Mario A. Pera, 1728 Sweetbriar Drive, both of San Jose, Calif.
Filed June 26, 1964, Ser. No. 378,348
14 Claims. (Cl. 107—8)

1. A dough processing mechanism for making French rolls comprising
a frame,
a conveyor for moving dough pans in aligned, end-to-end relation in a path along the frame,
a plurality of rotary cutter disks mounted co-axially and in axially spaced relation above the path of the pans with the peripheries of the cutter disks positioned to cut through dough products on the pans, each of the cutter disks having a notch in its periphery to receive the ends of adjacent pans therein, and
dough pick-up means mounted on the axially outward side of each endmost cutter disk to pick up end trimmings cut by each endmost cutter disk from such dough products.



3,274,957
HAY WAFER REGULATOR
Robert E. Goolsby, 701 S. Harvard, Perryton, Tex., and Donald E. Yount, Perryton, Tex. (1816 7th Ave., Greeley, Colo. 80631)
Filed May 3, 1962, Ser. No. 192,257
8 Claims. (Cl. 107—14)

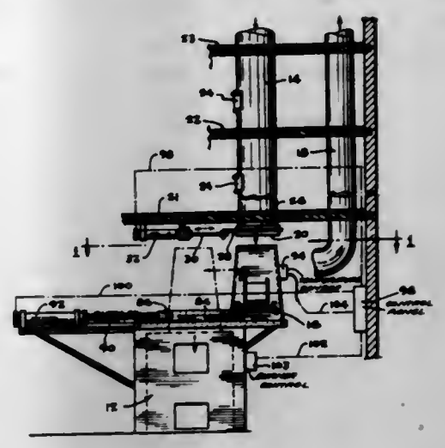
1. A hay wafer length control device for connection with a hay wafering machine having a hay wafer forming die, comprising: a tubular body, a control valve connected to one end of said tubular body, said valve having a valve control pin; an ear on said valve pivotally connecting said valve to said machine with said body coaxially aligned with said die; a centrally apertured partition within said body; a control rod axially disposed within said body through the aperture in said partition, said control rod projecting beyond the end of said body toward said valve; a loop formed on the outwardly projecting end portion of said control rod and loosely surrounding said valve control pin; a plate axially connected to said control rod within the end portion of said body adjacent said die; a pressure operated cylinder pivotally connected at one end to said machine, said cylinder having an extend-



able piston shaft pivotally connected by its free end to the end of said body adjacent said die; tubing interconnecting said control valve and said cylinder with a source of pressure, whereby hay forced into said body from said die moves said control rod in one direction to open said valve and extend said piston shaft to move said body away from said die; and spring means within said body between said partition and said plate for moving said control rod in the opposite direction, closing said valve, retracting said piston shaft and returning said body to hay wafer receiving position.

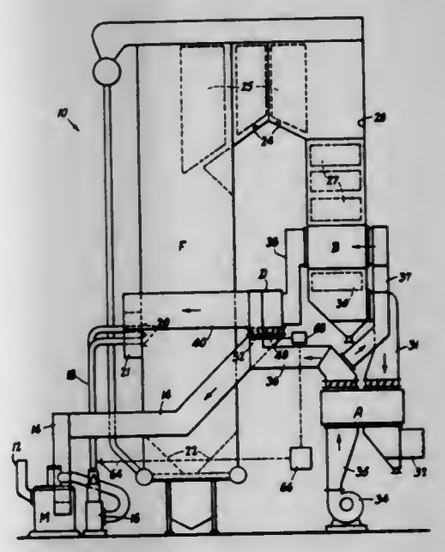
3,274,958
COMESTIBLE
Edwin J. Otken, North Brunswick, N.J., assignor to Good Humor Corporation, Brooklyn, N.Y., a corporation of Delaware
Filed Aug. 5, 1963, Ser. No. 299,968
3 Claims. (Cl. 107—54)

3. A method of making a comestible comprising the steps of placing ice cream in liquid form in a mold, converting at least some of said ice cream in the outer region of said mold to solid form while maintaining said ice cream in the center region of said mold in liquid form, inserting into said mold a nozzle means, dispensing normally solid candy in liquid form through said nozzle means and into said mold, displacing with said candy at least part of said liquid ice cream from said center region, said candy and the part of said ice cream remaining in liquid form constituting a handle-means receiver, inserting handle means into said handle-means receiver, and converting said handle-means receiver to solid form, the step of displacing with said candy at least part of said liquid ice cream and the step of inserting the handle means being in any order.



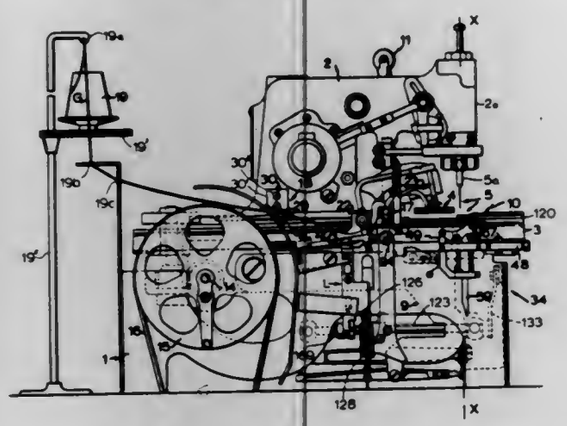
3,274,959
BUN DIVIDER AND ROUNDER
James A. Jimenez and Harold H. Olmsted, both of 6252 N. Hart Ave., Temple City, Calif.
Filed Oct. 23, 1962, Ser. No. 232,484
5 Claims. (Cl. 107—68)

1. A bun divider and rounder comprising
(a) a base housing having a support top,
(b) a dough container having a lower discharge opening, mounted on and movable on said support top between an operative position and a dough-filling position,
(c) a housing extension on the base housing located to house the dough container when in operative position,
(d) means mounted in the housing extension to apply dough-extruding pressure on the dough in the container in said operative position of the container,
(e) means including a rotary slicer to cut through dough extruded from the discharge opening of the container to form a bun divided from said dough,
(f) a conveyor to receive the bun of dough thus divided and to transport the same away from the discharge opening of the container, and
(g) means for engaging the periphery of the bun, while so transported, to round the same.



3,274,960
INCINERATOR
Richard Goder, 4241 N. Honore St., Chicago, Ill.
Filed Jan. 2, 1964, Ser. No. 335,150
4 Claims. (Cl. 110—7)

1. An improved waste materials incinerator assembly for a multiple story building comprising, in combination: an incinerator having a primary combustion chamber, a secondary chamber and a precipitator chamber, a charging chute extending continuously from the incinerator through each story of the multiple story building and having an opening at each story of the building for introduction of waste materials therein, said chute having a discharge opening at the incinerator terminal thereof whereby said materials pass down said chute toward the incinerator terminal thereof; a movable charging hopper in a first position being in registration with the incinerator terminal of the charging chute and in a second position being in registration with the materials charging opening in the incinerator, said hopper adapted in said first position to receive the waste mate-



rials passing through the charging chute; and, operating means to move said hopper into its first and second positions, respectively.

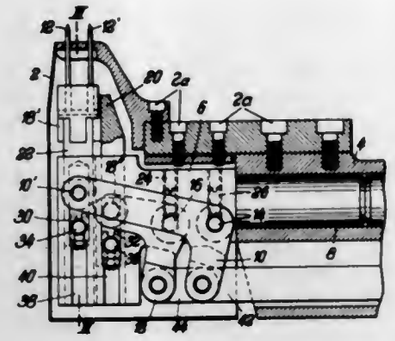
3,274,961
SYSTEM FOR HEATING AIR AND DRYING FUEL
Robert N. Wiechard, Hartford, and John B. Anderson, West Hartford, Conn., assignors to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware
Filed Dec. 29, 1964, Ser. No. 421,855
5 Claims. (Cl. 110—56)

1. In a fuel burning system comprising a mill for pulverizing fuel, a furnace for burning said fuel and generation of combustion gases, an air heating system for supplying air to said furnace and to said mill for drying of the fuel, the combination of a first air heater, a second air heater, a distribution chamber, duct means for conducting heated air from said first air heater to said second air heater, means for dividing said distributing chamber into a first portion and a second portion, duct means for conducting heated air from said first air heater to said first chamber portion, duct means for conducting heated air from said second air heater to said second chamber portion, duct means for conducting heated air from said first chamber portion and from said second chamber portion to said mill, and duct means conducting heated air from said first chamber portion and from said second chamber portion to said furnace.

3,274,962
GIMP-FEED MECHANISM FOR BUTTONHOLE-STITCHING MACHINES
Hermann Pudelko, Bielefeld, Germany, assignor to Dürkoppwerke Aktiengesellschaft, Bielefeld, Germany, a corporation of Germany
Filed June 28, 1965, Ser. No. 467,438
Claims priority, application Germany, Aug. 26, 1964, D 45,278
12 Claims. (Cl. 112—65)

1. In an automatic buttonhole-stitching machine comprising support means, a fabric-carrying table longitudinally shiftable upon said support means, stitch-forming means on said support means co-operating with said table for stitching a buttonhole upon a fabric carried thereby, drive means connected with said table and said stitch-forming means and actuatable for displacing said table from a starting position relative to said stitch-forming means into a stitching position wherein the sewing of a buttonhole is commenced and for operating said stitch-forming means and said table to form the buttonhole and for hereafter returning said table to said starting position, and an actuating element shiftably mounted on said support means and operatively connected with said drive means for actuating same following an initial movement of said element prior to energization of said drive means, the combination therewith of:

gimp-supply means for dispensing a gimp to be stitched into the buttonhole by said stitch-forming means;



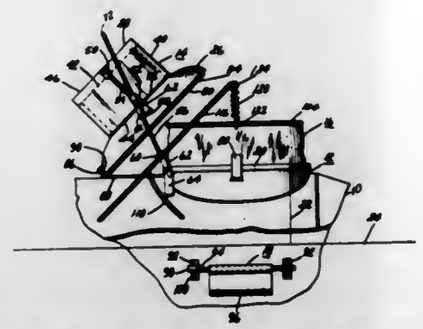
means forming a path for said gimp from said supply means to said stitch-forming means;

gimp-preparation means along said path including said element and effective upon displacement of said element prior to actuation of said drive means for drawing a length of gimp from said supply means and disposing it loosely at said gimp-preparation means; and

gimp-clamping means on said table between said gimp-preparation means and said stitch-forming means for clamping the free end of said gimp upon conclusion of a buttonhole-stitching operation and during operation of said gimp-preparation means but thereafter releasing said gimp for incorporation of the prepared length thereof in the buttonhole.

3,274,963
NEEDLE DRIVE MECHANISM FOR BAG SEWING MACHINES
Hans-Otto Keller, Frankfurt am Main, and Günter Sommer, Kelsterbach, Germany, assignors to Maschinenfabrik Moenus A.G., Frankfurt am Main, Germany, a firm
Filed Dec. 1, 1964, Ser. No. 415,111
Claims priority, application Germany, Feb. 8, 1964, M 59,859
6 Claims. (Cl. 112—213)

1. In a machine for making trunks, bags or the like in which the side walls thereof are sewed to the bottoms and to the covers, said machine having a carrier arm containing reciprocable driving means for the sewing and feeding mechanism; a stationary housing secured to the end of the carrier arm; a transport block horizontally rockably mounted in said housing; said mechanism including sewing and feeding needle bars reciprocably mounted in



said block; and angular driving levers for said bars pivotally mounted on said block each having a relatively short downwardly extending arm connected to said driving means respectively and having a relatively long horizontal arm connected with its related bar, whereby the said housing will have a minimum height to permit sewing of relatively small trunks and bags.

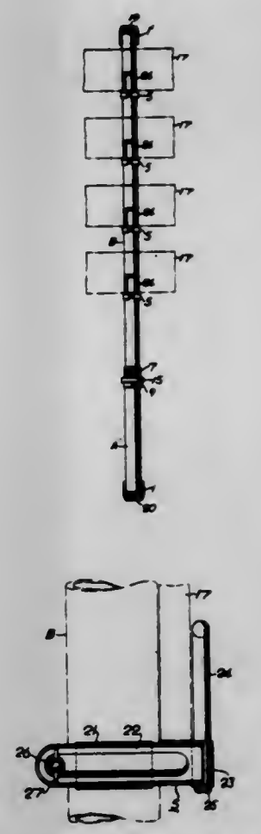
3,274,964
RE-CLOSABLE HERMETICALLY SEALED CONTAINER
Elmer W. Griese, Jr., Skokie, Ill., assignor to Ekco Containers, Inc., a corporation of Illinois
Original application Feb. 12, 1964, Ser. No. 344,405. Divided and this application Sept. 24, 1965, Ser. No. 490,009
5 Claims. (Cl. 113—121)

1. In the production of a can top for application to a can body to form a reclosable hermetically sealed package, the method that comprises forming sheet metal can stock to provide a cross wall with attaching structures about the periphery thereof including an upstanding continuous chine wall and an outwardly projecting flange on said chine wall for seaming the top into position on a can body, subjecting said cross wall to drawing and forming operations wherein a central portion of the cross wall spaced inwardly from said chine wall is punched free from said cross wall and the inner border portion of said cross wall is formed as a continuous sealing and supporting upper ledge rigid with an adjacent to said chine wall and with a downwardly stepped portion providing a continuous lower ledge the inner edge of which is formed as a curl to define a relatively large pre-cut opening in the cross wall, placing a disk-like wall member made from can stock loosely in position on the lower ledge with its upper surface in the plane of said upper ledge, and placing an impervious stiff cover in the space bordered by said chine wall and adhesively securing the same to said metal wall member and to said upper ledge in a hermetically sealed relation continuously and throughout the entire periphery of said upper ledge.

3,274,965
HATCH COVER AND CONNING TOWER MECHANISM
Franklin E. Rigsby and Woodrow Rigsby, both of 9525 Fritz Road, Fort Wayne, Ind.
Filed July 16, 1964, Ser. No. 383,042
9 Claims. (Cl. 114—16)

8. For use in a submarine, a hull having an opening therein, a conning tower of flexible, foldable and waterproof sheet-like material, one end of said tower being positioned in registry with said opening, means sealing said one end to said hull, said tower being selectively extensible outwardly from said hull and foldable to a collapsed position within said opening, said hull in the region immediately beneath said tower being open for occupancy by an operator, said tower being disposed outside said region in both collapsed and extended conditions.

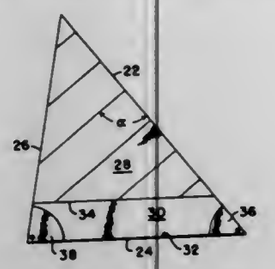
3,274,966
WATER SURFING CRAFT
Scott C. Rethorst, 1661 Lombardy Road, Pasadena, Calif.
Filed July 6, 1965, Ser. No. 469,426
11 Claims. (Cl. 114—62)



1. A water craft comprising:

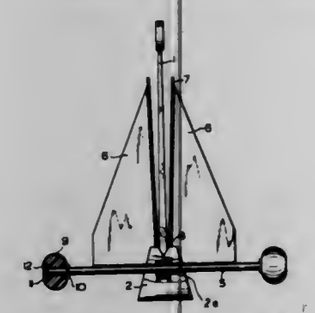
a hull having a bottom element which is longitudinally concave down substantially over its entire length, and which has a sharp leading edge from which its lower surface extends aft with a concave curvature and from which its upper surface extends aft to at least some extent with a convex curvature substantially parallel to the lower surface, so that substantially the entire water flow along said bottom element has an upwardly oriented convex interface configuration, and thrust producing means for propelling said craft in longitudinal direction, thereby causing water to flow underneath said hull producing upwardly directed centrifugal force for sustaining said craft.

3,274,967
SHORING STANCHIONS FOR MARINE USE
Toshio Igaue, Koboku-ku, Yokohama, and Tamotsu Shimodera, Tokyo, Japan, assignors to Mitsui Osk Lines, Ltd., Osaka, Japan, and Kobe Steel Works, Ltd., Kobe, Japan
Filed Oct. 26, 1964, Ser. No. 406,619
Claims priority, application Japan, Oct. 26, 1963, 38/80,748, 38/80,749
1 Claim. (Cl. 114—75)



A shoring stanchion for marine use comprising in combination: a lower tubular pole having a bore, an upper tubular pole having a lower portion which is adapted to fit into the bore of the upper portion of said lower tubular pole, a coupling tube having diametrically opposed U-shaped slots and having an exterior wall surface which is threaded, said coupling tube being adapted to fit over the upper portion of said lower tubular pole, said upper tubular pole having diametrically opposed vertically spaced openings in the lower portion of its wall, a knock pin adapted to be inserted through said slots and said openings for positioning the upper pole with respect to the lower pole a nut being engageable with the outer thread of said coupling tube for supporting said pin from underneath, and supporting brackets mounted on said stanchion for supporting planks in a horizontal position on the stanchion such that the planks serve to secure marine cargo in a desired position, said supporting brackets including a pair of side plates, each of said side plates having an opening through one end thereof, bracing plates arranged on the inner sides of said side plates for embracing a pole of the stanchion, an inverted U-shaped frame having two legs, a cylinder being fixedly secured to the other end of each of said side plates for receiving a respective one of said legs of said U-shaped frame so that the side plates are positioned at right angles with respect to the U-shaped frame, a headed bolt adapted to pass through the openings provided in the one end of said side plates, and a nut mounted on said bolt whereby said nut and bolt coact with said side plates for clamping the brackets to the pole.

3,274,968
SAIL
Paul E. Hayes, 5 Rowell Ave., and Richard F. Hayes, 10 Storey Ave., both of Beverly, Mass.
Filed Sept. 15, 1964, Ser. No. 396,663
5 Claims. (Cl. 114—103)

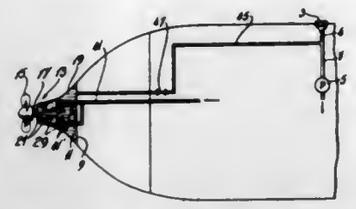


1. A loose-footed sail including a plurality of panels of woven sailcloth defining the major area of said sail, said sailcloth being substantially stretch-free in its warp and woof directions, a leech edge on said sail parallel to one of said substantially stretch-free directions of said sailcloth comprising said major area of said sail and generally normal to said other of said stretch-free directions,

a foot edge on said sail, a bottom edge on said major area of said sail generally parallel to said foot edge, said bottom edge comprising bias cut edges of a portion of said plurality of panels, substantially stretch-free means

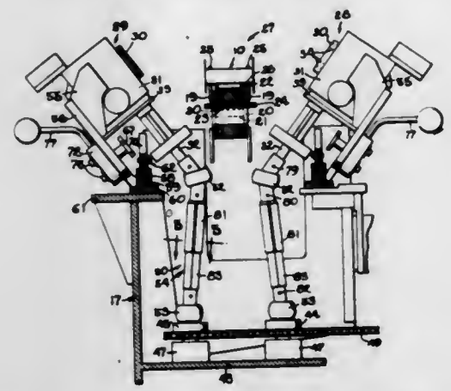
joining said bottom edge of said major area along said bias cut edges to said foot edge, and a luff edge on said sail at a discrete angle to said leech edge and to said foot edge and extending therebetween.

3,274,969
ANCHOR
Erwin Baas, Up de Schanz 66, Hamburg-Nienstedten, Germany
Filed Dec. 18, 1964, Ser. No. 419,344
Claims priority, application Germany, Dec. 21, 1963, B 74,771
3 Claims. (Cl. 114—208)



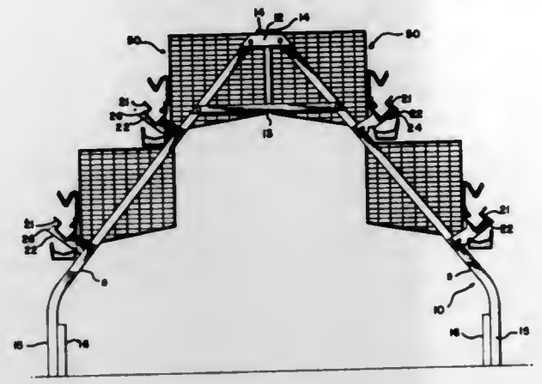
1. A plate anchor which comprises: an anchor shank having one end portion provided with means adapted to receive a chain, an anchor head, stock means extending through the other end portion of said shank and through said head and pivotally connecting said shank and said stock means to each other to permit a tilting movement of said shank and said head relative to each other, said head including two fluke members arranged on opposite sides of and substantially symmetrically with regard to the titlting plane of said shank, each of said fluke members including a plate of an approximately triangular formation and in proper anchoring positio of said anchor having its major surface approximately parallel to the anchoring ground, and substantially round members respectively rotatably mounted at the ends of said stock means and having a diameter representing a multiple of the diameter of said stock means and being adapted when said flukes are in nearly upright position on the anchoring ground to support said anchor on the anchoring ground and to guide the same thereon into the proper anchoring position of said fluke members.

3,274,970
NON-CLOGGING WATER INTAKE FOR WATER VESSELS
Otton Daniel, 2860 Darling Place, Montreal, Quebec, Canada
Filed Oct. 23, 1964, Ser. No. 406,117
6 Claims. (Cl. 115—.5)



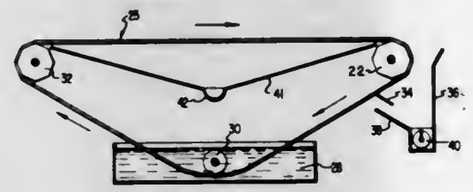
1. Non-clogging water intake means for water vessel having a propelling screw and a stern portion leading to said screw, the combination comprising:

(a) means defining a water compartment in said stern portion;
(b) a water box on each of the port and starboard sides of said stern portion in said compartment and adjacent said screw; said boxes disposed below the water line of said vessel in the area of turbulence created by said screw; each box having an opening facing outwardly of said water compartment;



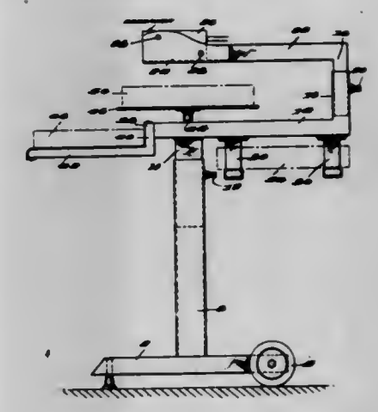
(c) a screen on each box across said opening to allow water into said boxes;
(d) a pump in said vessel;
(e) means to discharge water from said boxes into said compartment, and
(f) water tap means interconnecting said compartment and pump to draw water from said compartment.

3,274,971
CARTON CLOSING MACHINE
Carl J. Beert, Rockford, Ill., assignor to Bartelt Engineering Company, Inc., Rockford, Ill., a corporation of Delaware
Filed June 4, 1963, Ser. No. 285,430
2 Claims. (Cl. 118—239)



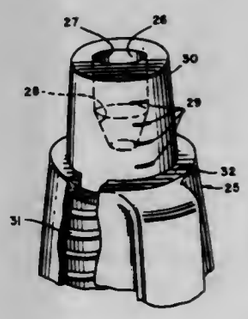
1. In a machine for gluing and closing the flaps on the ends of cartons, the combination of, a frame, a carrier on said frame for advancing cartons along a horizontal path with the flaps at one end of the cartons open and disposed in a vertical plane paralleling said path on one side thereof, a drum disposed on said one side with the periphery of said drum normally tangent to said plane to roll on the flaps of passing cartons, means for supplying glue to the periphery of said drum for transfer to said flaps, a support disposed below said drum, a shaft fast at one end on and coaxial with said drum and journaled on said support for rotation about its axis, a power actuator for rotating said shaft to roll said drum along the passing flaps, means pivoting said support on said frame for swinging about a fulcrum spaced from and generally parallel to said path to tilt said drum away from said plane into an out-of-the-way position, and a drive connection between said shaft and said power actuator including a first universal joint mounted on the lower end of said shaft, a second universal joint journaled on said frame below said first joint and connected to said actuator to be rotated thereby, and an axially extensible shaft extending between and coupled to said joints whereby said drive connection tilts and extends to accommodate swinging of said lower shaft end as said drum tilts to said out-of-the-way position.

3,274,972
EGG LAYING BATTERIES
Everett M. Keen and Anthony J. Siciliano, Millville, N.J., assignors to Keen Manufacturing Corporation, Millville, N.J., a corporation of New Jersey
Filed Apr. 15, 1965, Ser. No. 448,300
14 Claims. (Cl. 119—48)



1. In a cage battery for laying hens, a plurality of upright frames, each comprising a pair of downwardly and outwardly sloping members defining a substantially inverted V-shaped unit, disposed in longitudinally spaced parallelism,
a bracket outstanding from each of said sloping members at a given level intermediate the height of the members,
an elongated generally channel shaped trough disposed in said brackets,
and a plurality of cages arranged side by side in a longitudinal series between said frame units, being hooked to said troughs and supported thereby.

3,274,973
CONFINEMENT FEED METHOD AND APPARATUS THEREFOR
Louis S. Woods, Rte. 1, Adrian, Mo., and Virgil W. Morris, Rte. 1, Butler, Mo.
Filed June 9, 1964, Ser. No. 373,784
11 Claims. (Cl. 119—51.11)

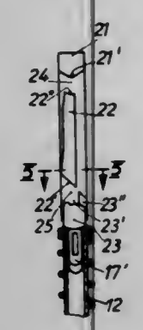


1. Animal environment and articulated flooring which presents a substantially solid surface for animal support and provides for separate accumulation of liquid and solid waste matter comprising
floor board means including a plurality of individual elongated floor boards having substantially rectilinear longitudinal side edge configuration,
continuous conveyor means for the floor board means including continuous linkage means with individual links and means for securing individual floor boards to individual links to present a substantially solid surface for animal support when the continuous linkage means travels in a substantially horizontal plane,
drive means for the continuous conveyor means including cog means for contacting the individual links to move the continuous linkage means out of a horizontal plane without disturbing the means for securing individual floor boards to the individual links, and
drainage pan means between an upper work path of the continuous conveyor means and a lower return path of the continuous conveyor means, the drainage pan means being disposed to service substantially the entire upper work path of the continuous conveyor means.

3,274,974
BABY CHICK DEBEAKING AND PACKING MECHANISM
Lamar Reynolds, Rte. 2, Box 140, Gainesville, Ga.
Filed Mar. 4, 1965, Ser. No. 437,164
8 Claims. (Cl. 119—103)

1. A device for use in handling baby fowl, comprising a stand, a horizontal support mounted on said stand to turn about a vertical axis for receiving a chick restraining shipping box, said stand having tray-receiving means thereon at the front to receive and support an incubator tray in a position in front of and at a level slightly below said horizontal support, said stand having a forwardly extending arm extending above said horizontal support, and debeaking mechanism carried by said arm in a position to allow debeaking of fowl by a operator standing in front of the device.

3,274,975
BALL POINT PEN INCORPORATING A POINT RECONDITIONING DEVICE
James G. P. Dehlsen, South Pasadena, Calif., assignor to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Filed Nov. 9, 1964, Ser. No. 409,887
1 Claim. (Cl. 120—1)



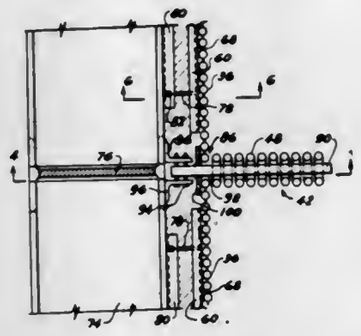
A ball point writing instrument comprising a tubular outer barrel open at its forward end, a writing unit with a writing tip comprising a socket member provided with a writing ball rotatably retained therein by an annular forward lip portion of said socket closely spaced from said ball ahead of the center of said ball and of tapered external configuration, said writing unit being removably housed within said barrel for movement between a projected position in which said writing tip projects through

the open end of said barrel and a retracted position in which said writing tip is withdrawn into said barrel, an axially reciprocable pushbutton restrained against rotation relative to the barrel and projecting rearwardly from the rearward end of said barrel, resilient means urging said pushbutton in a rearward direction, and a device for reducing the clearance between said lip and said ball, said device comprising wall means forming a rearwardly opening recess in the rearward end of said pushbutton adapted to receive the writing tip of said unit when said unit is removed from said barrel, said wall means being of greater hardness than the socket member of said tip and defining a plurality of surface areas immovable relative to one another adapted simultaneously to engage the forward lip portion of said tip along lines corresponding substantially to the generatrix of said exterior forward portion of said tip at spaced intervals about the periphery thereof whereby the rotative insertion of said tip into said recess under axial force acting against said resilient means causes said forward lip portion to be constricted by the surface areas of said wall means of the device.

3,274,976
MULTIPLE PEN COMPRISING A PLURALITY OF WRITING POINTS OF DIFFERENT COLORS

Francis Levoin, Lugano, Paradiso, Switzerland, assignor to Real Patentauswertungs Anstalt, Vaduz, Liechtenstein

Filed Dec. 17, 1964, Ser. No. 419,063
Claims priority, application Switzerland, June 27, 1964, 8,474/64
4 Claims. (Cl. 120—42.13)

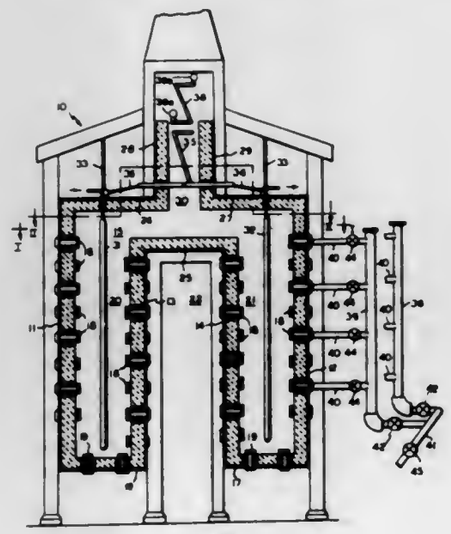


1. A multiple pen comprising a plurality of elongated writing elements within an elongated casing, each said element having a point for writing with a different colored ink, said elements being individually lengthwise reciprocable between extended writing position and retracted position, resilient means continuously urging all said writing elements toward said retracted position, a blocking member rotatable about said axis and about which said writing elements are disposed, said blocking member having alternate cavities and projections about its periphery, each writing element having three inwardly extending projections spaced apart lengthwise along its upper end, the upper two of said three projections being spaced apart by a first cavity and the lower two of said three projections being spaced apart by a second cavity, the upper and middle of said three projections having downwardly inclined lower surfaces that incline in the same direction, said downwardly inclined surface of said upper projection bearing against a blocking member projection when the associated writing element is in said writing position, said inclined surface of said middle projection bearing against a blocking member projection when the associated said element is in said retracted position, said inclined surfaces being directed in a sense to impose torque about said axis on said blocking member projections.

3,274,977
ARRANGEMENT OF A BUCKSTAY SYSTEM FOR WIDE FURNACE STEAM GENERATORS

Earl K. Rickard, East Granby, Conn., and Henry Schroeder, Jackson Heights, N.Y., assignors to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware

Filed Nov. 12, 1964, Ser. No. 410,521
8 Claims. (Cl. 122—240)

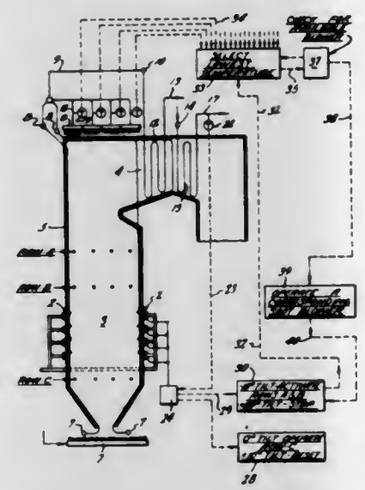


1. A vapor generator having a furnace with upright, rectangularly disposed tubulous side walls; a tubulous division wall dividing said furnace into spaced chambers; a furnace stiffening system surrounding said furnace including horizontally arranged buckstay means secured to and supported on the tubes of said side walls externally of said furnace; means for reducing the unsupported span of said buckstay means including tie means positioned intermediate the ends of said buckstay means, said tie means extending through said furnace parallel to said division wall between a pair of opposed side walls; openings in said side walls permitting passage of said tie means, means external of said furnace securing the opposite ends of said tie means to said buckstay means; and the tubes of said division wall enclosing said tie means for cooling said tie means.

3,274,978
VERTICAL TUBE FLUID HEATER

Edward H. Palchik, Queen Village, N.Y., Thomas F. O'Sullivan, Wilton, Conn., and William Tucker, Great Neck, N.Y., assignors to The Lummus Company, New York, N.Y., a corporation of Delaware

Filed Feb. 24, 1964, Ser. No. 346,733
6 Claims. (Cl. 122—356)



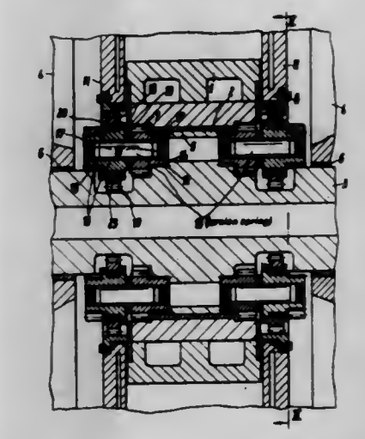
1. A heater for fluids comprising:
(a) end walls and a floor;
(b) a side wall disposed between said end walls;

(c) a second side wall of smaller height disposed parallel to said first side wall and forming a radiant heating section;
(d) a roof mounted on said end walls and said first side wall and forming an opening between said roof and the upper portion of said second side wall;
(e) upper side and end walls mounted on said roof and around said opening and defining a convection section with said end walls, the axis of said convection section being offset from the axis of said radiant section, and said convection section being in flue gas communication only with said radiant section via said opening;
(f) vertical process tube means positioned intermediate said side walls in said radiant section;
(g) a plurality of rows of radiant burners positioned in said side walls of said radiant section, each row of burners having a manifold associated therewith and each manifold having valve means whereby each row of burners is individually controlled;
(h) convection heating means in said convection section, said means comprising first and second serpentine conduit means;
(i) crossover means in fluid communication with said vertical process tube means and said first serpintine conduit means, one serpentine conduit means being in fluid communication with a single process tube means;
(j) inlet means for said first serpentine conduit means;
(k) inlet and outlet means for said second serpentine conduit means; and
(l) outlet means for said vertical process tube means.

3,274,979
SOOT BLOWER OPERATION FOR VAPOR GENERATOR FURNACES

Elwood P. Petit, Windsor, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware

Filed Sept. 28, 1964, Ser. No. 399,559
11 Claims. (Cl. 122—392)

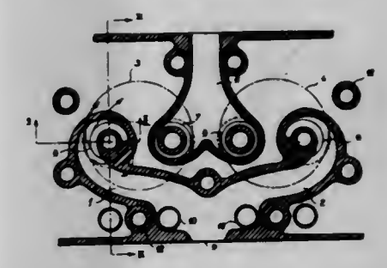


1. A vapor generator furnace comprising: means for burning an ash bearing fuel within the furnace; a plurality of groups of tubes lining the walls of said furnace in parallel flow relation; means for passing fluid through said tubes whereby the temperature of the fluid is increased; means for sensing the total heat absorbed by the fluid passing through each of said group of tubes; at least one soot blower associated with each group of tubes; and means for operating a soot blower associated with a group of tubes in response to the heat absorption sensing means related to the corresponding group.

3,274,980
ROTARY PISTON INTERNAL COMBUSTION ENGINE

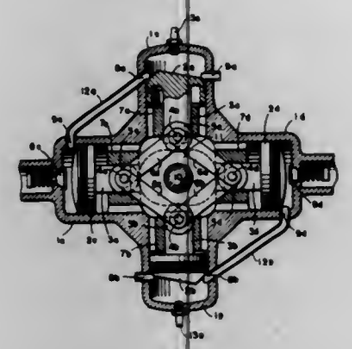
Hubert Abermeth, Cologne, Germany, assignor to Klockner-Humboldt-Deutz Aktiengesellschaft, Cologne, Germany

Filed Aug. 23, 1963, Ser. No. 313,405
Claims priority, application Germany, Aug. 31, 1962, K 47,622
7 Claims. (Cl. 123—8)



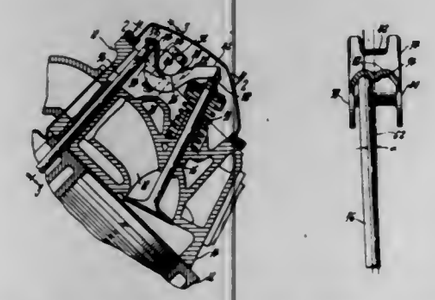
1. In a rotary piston machine, especially rotary piston internal combustion engine: a rotatable shaft with an eccentric, a piston journalled on said eccentric and provided with first gear means, housing means surrounding said piston and provided with second gear means, and a gear set supported by said eccentric and comprising two pinions respectively meshing with said first and second gear means, said gear set also including torsion spring means interconnecting said pinions.

3,274,981
CYLINDER HEADS FOR INTERNAL COMBUSTION ENGINES



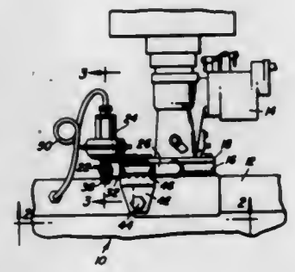
Lucien Péras, Billancourt, France, assignor to Regie Nationale des Usines Renault, Billancourt, France, a French works

Filed Mar. 30, 1964, Ser. No. 355,730
Claims priority, application France, Apr. 8, 1963, 930,834, Patent 1,361,447
5 Claims. (Cl. 123—30)



1. A cylinder head for internal combustion engines having at least two in-line cylinders, said head comprising an inlet and exhaust valve seat associated with each cylinder, the inlet seats of adjacent cylinders being positioned on either side of their corresponding outlet seats, a common inlet port for the inlet seats of adjacent cylinders, an inlet passage connecting said inlet port with its corresponding inlet seats, each of said inlet passages being routed slightly obliquely with respect to a line passing through the central longitudinal axes of said cylinders and terminating in a volute which leads up to and skirts the corresponding inlet valve seat before passing into said cylinder, the inner vertical wall of said inlet passage at the mouth of said volute being spaced at least as great a distance from the central longitudinal axis of said inlet seat as the inner annular wall of said inlet seat.

3,274,982
TWO-CYCLE TWO-CYLINDER INTERNAL COMBUSTION ENGINE
Masaaki Noguchi, Nagoya, and Shigeru Sakakibara, Aichi, Japan, assignors to To Yota Motors Company, Limited, Aichi Prefecture, Japan
Filed Sept. 23, 1964, Ser. No. 398,575
3 Claims. (Cl. 123—56)

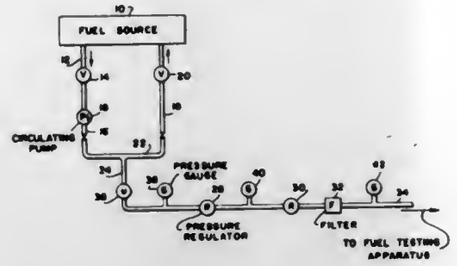


1. A two-cycle two-cylinder internal combustion engine comprising an engine shaft, a control cam of double lobed cocoon shape fixed to said engine shaft, two opposed engine cylinders each having a piston, two opposed feed pump cylinders each having a piston, said opposed cylinders being arranged radially with respect to the engine shaft in a cruciform, a piston rod of each of said pistons in the said four cylinders, each piston rod being provided on its inner end with a rotatable antifriction roller, and a linkage connecting the axes of said four antifriction rollers to form a parallelogram and adapted to hold said four antifriction rollers in rolling contact with the cocoon shaped cam edge of said control cam on the engine shaft.

3,274,983
SLOPING PUSH ROD ROCKER ARM MOUNTING
Russell L. Herring, Grosse Pointe Woods, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 6, 1965, Ser. No. 511,917
5 Claims. (Cl. 123—90)

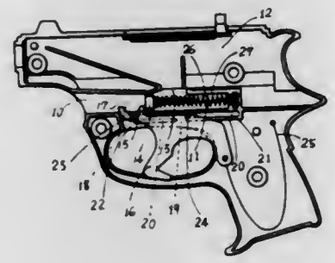
1. Valve gear for an internal combustion engine and comprising
- at least one valve actuating rocker arm, each said rocker arm being mounted for rocking movement around a predetermined axis,
- stop means preventing sliding movement of each said rocker arm in one direction along its axis,
- resilient means yieldingly opposing rocking movement of each said rocker arm in one direction and
- a push rod engaging each said rocker arm at a location spaced from its axis and opposing the force of said resilient means to rockingly actuate said rocker arm in said one direction, the direction of force of said push rod upon said rocker arm being disposed at an angle to a plane perpendicular to said axis whereby a component of said push rod force acts in a direction along said axis, said push rod force angle being the sole means to prevent movement of said rocker arm axially away from said stop means.

3,274,984
AUTOMATIC VACUUM SPOILER FOR INTERNAL COMBUSTION ENGINES
James J. Dolfi, Sr., P.O. Box 434, Torrance, Calif.
Filed May 17, 1963, Ser. No. 281,119
1 Claim. (Cl. 123—124)



In combination, an internal combustion engine including an intake manifold, a vacuum spoiler for said manifold, said spoiler comprising an air conduit supported exteriorly of said manifold and including inlet and outlet ends, extension conduit means communicating the outlet end of said conduit with the interior of said manifold, the inlet end of said conduit being communicated with the ambient atmosphere, said conduit being of one-piece construction and including a pair of diametrically opposite circumferentially extending slots formed therethrough and spaced circumferentially thereabout, an elongated plate-like valve member of a width less than the outside diameter of said conduit and of a thickness slightly less than the width of said slots, said valve member extending through said slots and being longitudinally reciprocal transversely of said conduit, the opposite side edges of said gate valve member and the portions of said conduit defining the opposite ends of said slots being disposed in slidable guiding engagement with each other and the opposite side faces of said gate valve member being disposed in closely spaced relation with the portions of said conduit defining the opposite sides of said slots whereby the said conduit will have a shearing action on foreign deposits accumulated on said side faces upon longitudinal shifting of said valve member, said valve member including an apertured portion and being selectively longitudinally shiftable between first and second positions with said apertured portion in and out of registry with the interior of said conduit, and force means connected to said valve member and operatively associated with said engine to selectively shift said valve member between said first and second positions in response to predetermined operating conditions of said engine.

3,274,985
FUEL SUPPLY SYSTEM
Alfred E. Traver, Great Neck, and George A. MacDonald, Floral Park, N.Y., assignors to Mobil Oil Corporation, a corporation of New York
Filed Mar. 19, 1965, Ser. No. 444,918
6 Claims. (Cl. 123—139)

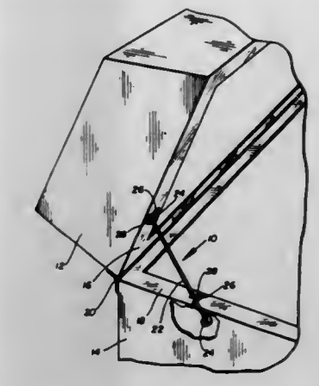


1. In a fuel supply system for supplying a liquid fuel at a first rate to an engine from a source of supply remote from the engine, the combination of fuel movement means substantially devoid of fuel-stagnation means for withdrawing fuel from the source of supply and moving it at substantially uniform velocity past a location close to the engine at a second rate faster than the first rate, a chamber, coupling means coupling together the fuel-movement means at said location and the chamber for

supplying liquid fuel to the chamber at a third rate intermediate the first and second rates, the coupling means including a first conduit having a portion thereof inclined upwardly in the direction of fuel flow to facilitate the passing of bubbles of gas therethrough into the

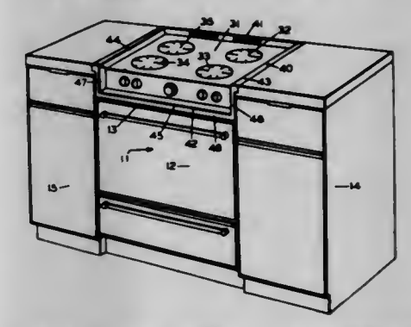
chamber, the chamber including a gas space above the normal level of liquid fuel therein to receive the gas bubbles, an outlet from the chamber for supplying fuel from the chamber to the engine, and overflow means for conveying away from the chamber liquid fuel therein that exceeds a predetermined level.

3,274,986
TOY GUN WITH DOWNWARDLY INCLINED STRIKER SPRING
Hiroshi Yano, % Sekiden Kagaku Kogyo Co., Ltd., No. 2, 1-chome, Jinai-cho, Moriguchi-shi, Osaka, Japan
Filed Aug. 24, 1964, Ser. No. 391,433
1 Claim. (Cl. 124—27)



A toy gun comprising:
a housing;
a longitudinal bore in said housing;
a spring chamber aligned with the rear end of said bore;
a striker coil spring; and
means mounting a rearward portion of said spring in said spring chamber and a forward portion of said spring in said bore with the longitudinal axis of said forward portion of said spring inclined downwardly from the longitudinal axis of said bore whereby said forward portion of said spring will move in a straight direction in said bore when expanding from a compressed state.

3,274,987
HOOD SUPPORT FOR CHARCOAL COOKER
Earle Grant Hastings, Jr., Tulsa, Okla., assignor to Hasty-Bake Manufacturing Company, Inc., Tulsa, Okla., a corporation of Oklahoma
Filed Jan. 14, 1965, Ser. No. 425,387
7 Claims. (Cl. 126—25)

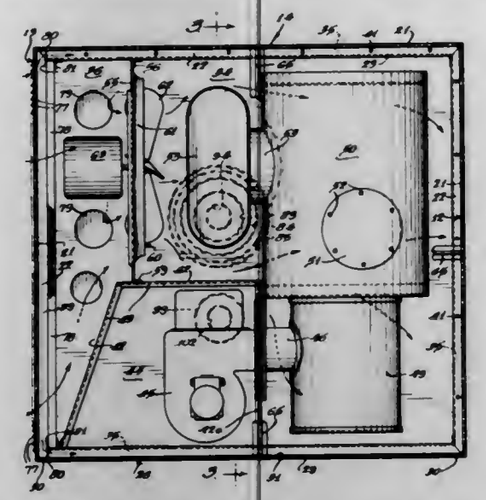


1. In a charcoal cooker, the combination comprising:
- a body portion having a flange at the top of said body portion, said flange having an opening therein consisting of a T-slot and T-stem;
- a hood portion having a flange at the bottom thereof, said flange having an opening therein consisting of a T-slot and T-stem;

said T-slots and T-stems in said body portion and said hood portion being positioned so that when the hood portion is closed upon said body portion said T-slots and T-stems substantially coincide; and

- a hood stop disposed within said T-stem and T-slot of said body portion and within said T-stem and T-slot of said hood portion.

3,274,988
GAS RANGE
George McArthur, Jr., Delaware County, Ohio, assignor to The Sunray Stove Company, Delaware, Ohio, a corporation of Ohio
Original application Feb. 20, 1961, Ser. No. 90,236, now Patent No. 3,176,677, dated Apr. 6, 1965. Divided and this application Aug. 27, 1964, Ser. No. 392,427
6 Claims. (Cl. 126—39)

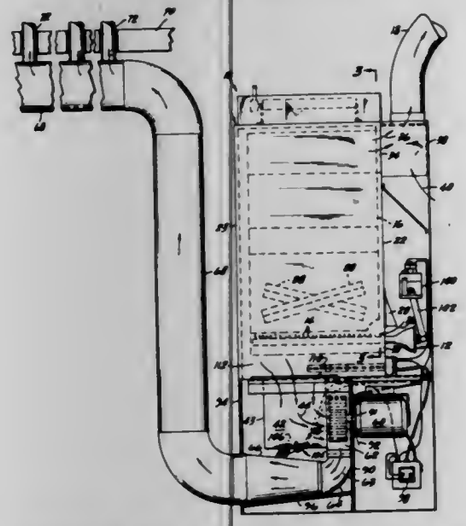


1. A separable frame for effecting cooperation between the top of a recessed top gas range and cabinets abutting the sides of said range, said frame consisting of a rear rail and a forward rail, the rear rail being substantially straight and unitary and the forward rail being unitary and substantially U-shaped, said forward rail having two side rail portions and a front rail portion, each said side rail portions being provided with outwardly extending flanges to overlie the abutting edges of said side cabinets and the front rail portion being also U-shaped having two downwardly extending legs and a horizontally extending lower connecting portion between the lower ends of said legs.

3,274,989
AIR HEATER
Kenneth S. Jenson and Frederick W. Suhr, Wisconsin Rapids, Wis., assignors to Preway, Inc., a corporation of Wisconsin
Filed Dec. 31, 1963, Ser. No. 334,693
5 Claims. (Cl. 126—110)

1. An air heater, comprising: a housing having an exterior wall defining at least an air inlet and an air outlet for said air heater; means defining an air heating chamber within said housing so that intake air is directed through separate branch flow paths from said inlet, one of said flow paths defining a blanket of insulating air between said exterior wall and said heating chamber, the other of

said flow paths defining a generally direct route from said inlet, through said heating chamber, to said outlet; a blower mounted in said housing for drawing air in from a room, through said separate flow paths and discharged



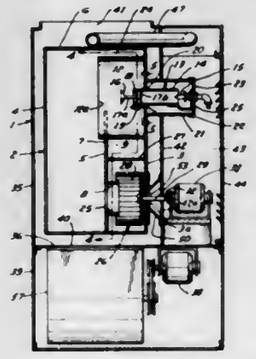
as heated air back to the room; and a filter in said other flow path adjacent said inlet creating a resistance to the flow of air through said other flow path to insure the flow of air induced by said blower into said insulating flow path while filtering air through said other flow path.

3,274,990

MASS-PRODUCTION LOW-COST FURNACE FOR SUPPLYING HIGH-TEMPERATURE HIGH-VELOCITY AIR FOR DOMESTIC HEATING

Calvin D. MacCracken, Tenafly, N.J., assignor, by mesne assignments, to Calmac Corporation, Boston, Mass., a corporation of Massachusetts

Filed Aug. 12, 1964, Ser. No. 389,121
12 Claims. (Cl. 126—110)



1. In a domestic hot air furnace for space heating, apparatus for providing high velocity air at an elevated temperature in the range from 250° F. to 375° F. comprising fuel burner means for providing hot gas products of combustion, means for providing combustion air to support the combustion, heat exchanger means including a plurality of walls surrounding said burner means and extending upwardly above said burner means for conducting the hot gases upwardly, exhaust duct means connected to the upper portion of said heat exchanger means for conducting away the gas products of combustion after their upward flow within the walls of said exchanger means, suction plenum chamber means positioned below said heat exchanger means, a blower having its intake communicating with said suction plenum chamber for maintaining the pressure within said suction plenum chamber below atmospheric pressure, a plurality of baffle walls in closely spaced relationship with respective exchanger walls for defining a plurality of narrow passages adjacent to said exchanger walls and for blocking off air flow through said furnace except through said narrow passages, said narrow passages each communicating at their lower ends with said suction plenum chamber, air inlet means including a filter for supplying air to the upper ends of said narrow passages, an outer jacket around said furnace, an insulation layer within said jacket and closely adjacent to said jacket providing a narrow cooling air space between said jacket and said insulation layer, the lower portion of said cooling air space communicating with said suction plenum chamber for drawing cooling air through said cooling space between said jacket and insulation layer for maintaining the casing of said furnace cool during operation.

3,274,991

HEATING FURNACE

William L. Schmieler, 19609 Winslow Road, Shaker Heights, Ohio 44122

Filed June 23, 1965, Ser. No. 466,183
19 Claims. (Cl. 126—110)

1. A furnace comprising a hollow heat exchanger having a peripheral wall, and front and rear walls, respectively, and an intermediate partition wall between, and in spaced face to face relation to both the front and rear walls, said intermediate wall having an inlet for products of combustion near one end and an outlet for said products near the other end, the space between the front wall and intermediate wall providing a recirculating duct connecting the outlet and inlet;

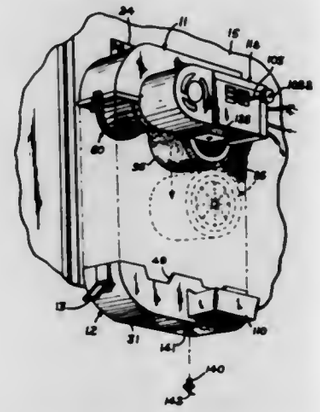
a combustion chamber disposed in said space at said one end and having an open discharge end which is aligned with said inlet and directed toward the rear wall;

said chamber having a peripheral enclosing wall spaced from the peripheral wall of the exchanger so that products from said duct can impinge on one side of said peripheral wall of the chamber and flow in surrounding relation thereto, said peripheral wall of the chamber at the discharge end being arranged in spaced relation, transversely of the discharge end, to the periphery of the inlet so as to form therewith an annular passage for discharging toward the rear wall;

burner means for discharging hydrocarbon fuel into the chamber in a direction toward the open discharge end, means having air induction ports connected directly to the atmosphere and arranged to permit induction of air into the chamber for sustaining combustion therein;

a power driven recirculating blower connected with the interior of the exchanger so as to recirculate products of combustion from said outlet into surrounding relation to the chamber and thence through said inlet;

bleeder duct means in communication with the exchanger and operable for bleeding to the atmosphere a fraction of the products being recirculated; and



the discharge end of the chamber and periphery of the inlet of the heat exchanger being spaced apart and arranged so that the recirculated products blown through the duct, combined with the bleeding of products of combustion into the atmosphere, create a low pressure zone around the discharge end of the chamber.

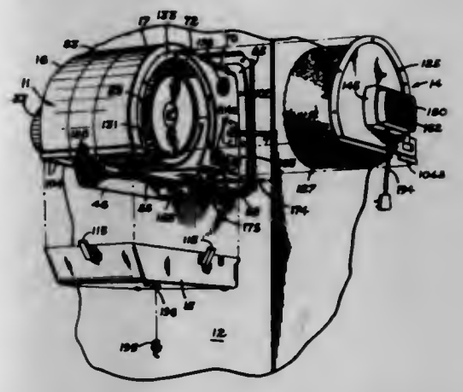
3,274,992

HUMIDIFIER

Warner W. Martin, Olmstead Falls, Ohio, assignor to The Lau Blower Company, Dayton, Ohio, a corporation of Ohio

Filed July 6, 1965, Ser. No. 469,496
9 Claims. (Cl. 126—113)

1. A humidifier assembly adapted for mounting on a furnace or the like comprising, a housing defining an air flow chamber and having one side adapted for mounting on the furnace, spaced inlet and outlet openings in said one side adapted to communicate with the interior of the furnace, said housing being split along a horizontal plane and including upper and lower portions, said upper portion adapted to be secured on the furnace, releasable means for securing said lower portion to said upper portion so that said lower portion may be detached from said upper portion for cleaning without detaching said upper portion from the furnace, an outer wall on said upper portion of said housing, drive means mounted on said outer wall exterior of said air flow chamber and having a tubular drive shaft which extends through said outer wall into said chamber, an evaporator drum assembly in said air flow chamber between said inlet and said outlet, said evaporator drum assembly including highly porous material secured on a support frame, a support shaft extending through said tubular drive shaft into releasable engagement with said support frame to connect said drum assembly to said drive shaft for rotation therewith, means defining a reservoir in said housing below said drum assembly for wetting said material, and means associated with said air flow chamber for moving air through said outlet opening to increase the moisture content of the air.



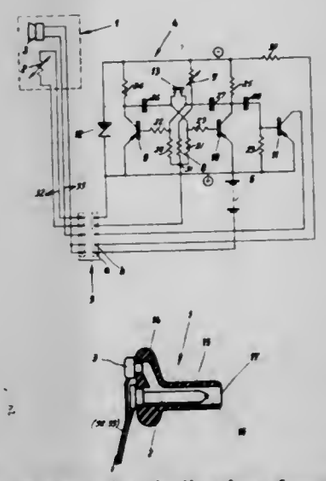
3,274,993

HUMIDIFIER

Warner W. Martin, Olmstead Falls, Ohio, assignor to The Lau Blower Company, Dayton, Ohio, a corporation of Ohio

Filed Sept. 13, 1965, Ser. No. 486,683
12 Claims. (Cl. 126—113)

1. A high capacity humidifier of the character described adapted to have one side thereof secured adjacent a vertical wall of a furnace or the like comprising, a housing having a vertical partition dividing said housing into air inlet chamber and humidification chamber, means defining a circular opening in said partition to interconnect said chambers, means on said one side of said housing adapted to connect said chambers to the interior of the furnace or duct, said housing having a removable side wall which forms one side of said humidification chamber, a highly porous evaporator drum mounted on said side wall and disposed in said humidification chamber, said drum having an outer size smaller than the size of said side wall so that said drum can be removed from said housing with said side wall, means for wetting said

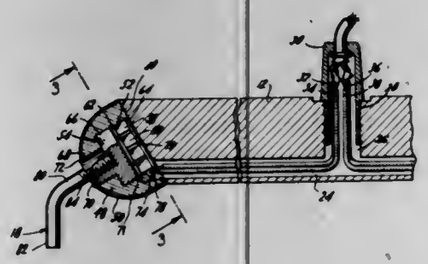


drum, said drum having an open end adjacent said partition, a motor mounted on a side wall opposite said first side wall and having its drive shaft extending into said housing through said air inlet chamber and said circular opening and into the interior of said drum, and a single inlet centrifugal blower wheel mounted on said shaft and disposed within said drum with its inlet aligned with said circular opening for effecting high velocity flow of air between said chambers, said blower wheel adapted to force air through the said evaporator drum to evaporate water therefrom to increase the moisture content of said air.

3,274,994

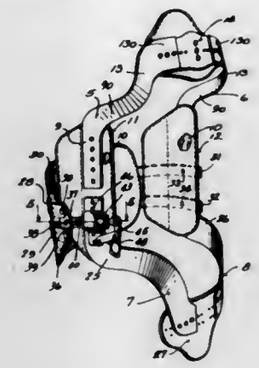
ARRANGEMENT FOR INDICATING FUNCTIONAL DISTURBANCES IN A LIVING BODY

Walter Sturm, Larchenring, Germany, assignor to Quarzlampen Gesellschaft m.b.H., Hanau am Main, Germany



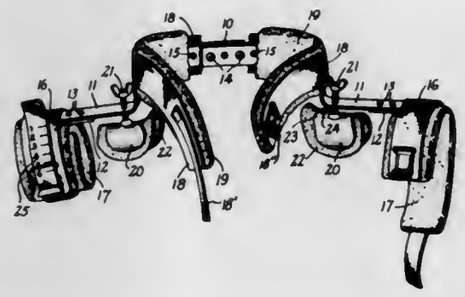
Filed Dec. 7, 1962, Ser. No. 243,149
Claims priority, application Germany, Dec. 8, 1961, Q 687
7 Claims. (Cl. 128—2)

1. An arrangement for indicating functional disturbances in a living body, particularly of mining personnel working underground, comprising, in combination a housing means having a wider outer portion of a given diameter adapted to be seated in the concha of the ear and an



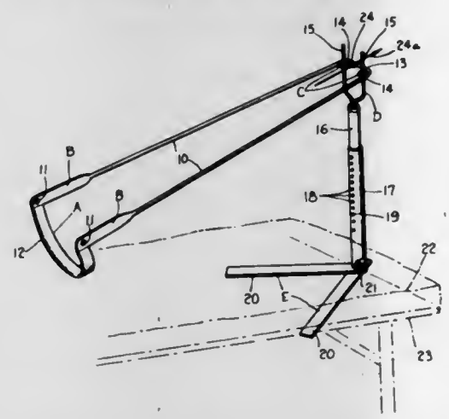
elongated narrower inner portion of a diameter less than said given diameter, only said elongated inner portion being adapted to be fitted into the auditory canal of an ear so as to be worn on a living being, said housing being closed at its outer end for preventing intrusion of ambient air into the auditory canals and forming a compartment; electric temperature detector means arranged in said compartment in such a manner that when said narrower inner portion is disposed in the auditory canal of an ear said temperature detector means is exposed to the body temperature only, and is protected from the temperature of the ambient air outside the auditory canal, said temperature detector means having an electric characteristic which changes with changes of the temperature to which it is exposed; and electric signaling means comprising an acoustical signal issuing means arranged also in said compartment of said housing means for giving when actuated an acoustical signal to be heard only by said living being who wears said housing means and signal producing electric circuit means actuating said signal issuing means and connected with said detector means for producing a signal when said temperature exceeds a predetermined value and accordingly said electric characteristic assumes a predetermined value.

3,274,995
THERMOELECTRIC DENTAL PROBE
William Eidus, 1 Bonnie Court, Spring Valley, N.Y.
Filed July 9, 1963, Ser. No. 293,679
5 Claims. (Cl. 128—2)



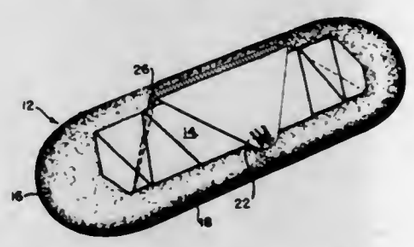
1. A thermoelectric probe for heat-transfer application to selected areas of a human body, said probe comprising an elongated probe member of heat-conductive material, a thermocouple housing mounted at each end of said probe member and a thermocouple module mounted within each of said housings, each thermocouple module comprising a group of semiconductor elements connected at their ends by opposed groups of electrically-conductive plates to form an electrical series of said semiconductor elements with the groups of plates constituting respectively hot and cold junctions of said thermocouple module when electrical current is fed to said series, a pair of leads connected to the ends of each semiconductor element series, and means for electrically connecting said leads to a current source, the cold junction plates of one module and the hot junction plates of the other module being located in intimate heat-exchange association with said probe member, a heat-conductive socket located within each thermocouple housing in heat-exchange association with the plates thereof opposite to said probe member, and a probe tip of heat-conductive material removably mounted within each socket and extending outwardly of the respective thermocouple housing, said probe member being sufficiently heat conductive to transmit the generated cold from the cold junction plates of said one module toward the center of said probe member, and to transmit the generated heat from the hot junction plates of said other module in the opposite direction toward the center of said probe member, whereby said generated heat and cold neutralize each other within said probe member.

3,274,996
SURGICAL BRACE
Eugene L. Jewett, Maitland, Fla., assignor to Florida Brace Corporation, Winter Park, Fla., a corporation of Florida
Filed Sept. 1, 1961, Ser. No. 135,510
4 Claims. (Cl. 128—78)



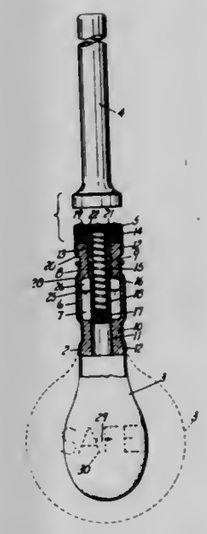
1. A surgical brace comprising laterally spaced torso side pads; frame means connecting the side pads and comprising sternal bars and pubic bars connected with the side pads, a lumbar pad having strap means connecting it with said frame means, a sternal pad having means connecting it with the sternal bars and a pubic pad having means connecting it with the pubic bars; the sternal bars extending upwardly from the respective side pads and thence extending substantially directly forwardly and curvilinearly toward each other and thence extending upwardly in approximate parallelism to the level of connection with the sternal pad, the sternal pad comprising an internal plate having an opening and the means connecting it with the sternal bars including a finger extending into said opening, the finger and plate having marginally notched portions in interlocked connection, the plate being self-adjustable with respect to the finger.

3,274,997
BRACES FOR CORRECTING HIP DISLOCATION
George F. Hewson, Jr., Palisade, N.J., assignor to St. Luke's Hospital Center, New York, N.Y., a corporation of New York
Filed Sept. 23, 1963, Ser. No. 310,787
1 Claim. (Cl. 128—78)



In a brace for treating congenital hip dislocation, the combination of a rigid frame including a pelvic bar of longitudinally curved contour for conformably engaging a peripheral portion of a patient's torso and two laterally arranged thigh bars each secured to an end portion of said pelvic bar, each thigh bar including an upright portion secured at its upper end to a portion of said pelvic bar and an arm portion extending substantially perpendicular from said upright portion, said arm portions extending outwardly from said pelvic bar in opposite directions and substantially colinear, each of said arm portions having band means at its outer end adapted to be fastened around and encircle a patient's lower thigh opposite the outer end of the femur, each thigh bar having a pressure plate mounted on the arm portion adjacent the upright portion, said pressure plate being concave and having a flared inner edge portion to conform to the thigh and body junction, said pressure plate mounting means including adjustable means to exert corrective pressure on the upper thigh in a direction toward the femur head while the outer end of the femur is held against displacement by said band means encircling the patient's lower thigh above the knee joint.

3,274,998
LEG SPLINT
Robert C. Grier, Jr., 303 W. Prentiss Ave., Greenville, S.C.
Filed Dec. 16, 1963, Ser. No. 330,746
3 Claims. (Cl. 128—85)

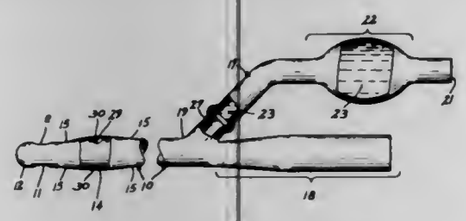


1. In combination, a leg splint having a pair of spaced rigid aligned members for extending on either side of a leg of a patient, means joining one end of said aligned members affording spaced loop portions for attaching devices to the splint, a stand having an upper portion with spaced projections accommodated by said loop portions, a base having elongateu laterally adjustable members, and vertically adjustable means joining the upper portion with the base.

3,274,999
ANATOMICAL DRESSING
Danforth R. Robinson, 442 Springfield Ave., Summit, N.J.
Filed July 29, 1963, Ser. No. 298,104
4 Claims. (Cl. 128—156)

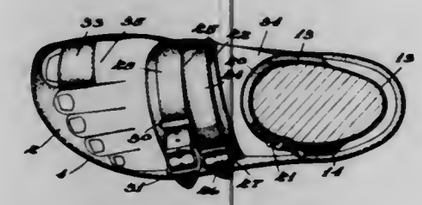
1. An anatomical dressing comprising,
an absorbent pad having a front side and a back side, and a flexible envelope normally flat-folded in relation to said pad,
said envelope having closed rear and side wall portions and an open mouth edge portion from opposite sides of which a pair of tabs extend,
one of said tabs being attached on its outer side to said back side of the pad leaving the main body of said envelope free from attachment to said pad, said main body of the envelope being folded to normally lie on said one tab with the other tab extending free exteriorly of the back side of said pad, whereby said other tab may be manually pulled to open the mouth of said envelope and permit said envelope to turn inside out while receiving the folded pad and said one tab which is attached thereto in completely enclosed position within the envelope.

3,275,000
SINGLE DOSE FOAMED MEDICATION APPLICATOR
Max E. Bowen, 30885 W. Six Mile Road, Livonia, Mich.
Filed May 20, 1963, Ser. No. 281,608
8 Claims. (Cl. 128—272)



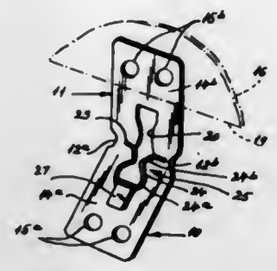
8. A medicinal dose capsule adapted to be used with an applicator comprising,
a double ended capsule having opposite first and second ends and openings formed in each end communicating with a central dose cavity containing a charge of medicating material under expansible gas pressure,
a common closure for said openings removable through the opening in said first end and extending in sealing relation through the opening in said first end and through said cavity into closing engagement in the inner end of the opening in said second end of said capsule,
said closure maintaining closing engagement within said opening in said first end of said capulse until after the closing engagement with the opening in said second end of said capsule is broken upon removing movement of the closure,
and an expansible and contractable chamber forming member connected to said in said second end of said capsule and adapted to receive the fully expanded charge of said medicating material.

3,275,001
SELF-INFLATABLE CATHETER
Dean A. Rosecrans, Gardena, Calif., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Filed May 22, 1962, Ser. No. 196,668
5 Claims. (Cl. 128—349)



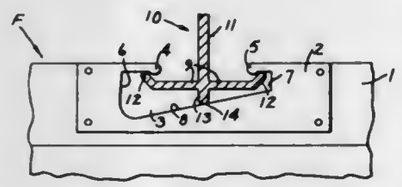
1. A catheter construction comprising:
(a) elongated tube-like means defining a pair of longitudinally extending passages, one of said passages being a body fluid discharge passage and the other being a retaining bag filling passage;
(b) said means having adjacent its forward end at least one orifice formed in said discharge passage to permit the flow of body fluid into said discharge passage;

(c) a resilient distensible wall member attached to said tube-like means and forming an inflatable retaining bag positioned rearwardly spaced from but adjacent said orifice;
(d) a second resilient distensible wall member movable between an expanded stressed position and a contracted position and which defines a fluid reservoir rearwardly spaced from said retaining bag and constructed to contain a fill liquid;
(e) said filling passage communicating with said inflatable bag and connected to said second distensible wall member;
(f) said second resilient distensible wall member being closed except for said connection between said filling passage and said second distensible wall member;
(g) releasable closure means positioned to close com-



munication between said reservoir and said inflatable bag until released;
(h) a fill liquid in said reservoir expanding said second resilient distensible wall member thereby creating stresses therein opposing expansion which if unopposed would contract said second resilient distensible wall member and which places said fill liquid under pressure from said second resilient distensible wall member; and
(i) the resilient distensible wall member forming said inflatable retaining bag being inflatable at a lower internal fluid pressure than the pressure on said fill liquid in said reservoir so that when said releasable closure means is released, fill liquid will pass into and inflate said inflatable retaining bag.

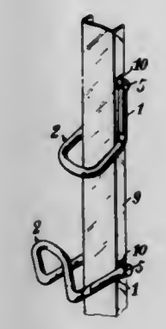
3,275,002
CORRECTIVE SANDAL
William M. Scholl, 213 W. Schiller St., Chicago 10, Ill.
Filed June 14, 1963, Ser. No. 287,870
3 Claims. (Cl. 128—581)



1. In a corrective sandal,
an outer sole,
an inner sole secured to said outer sole and having slots at predetermined locations therein,
a strap for engaging the foot adjacent the heel,
a strap for engaging the foot over the instep,
a separate strap having a portion extending in and out of certain of said slots to define a toe loop,
each of said straps having terminal end portions extendtending through certain of said slots and anchored between said soles, and
means defining a track between said soles for free movement of said toe loop strap portion which extends in such direction that when tightened the large toe is urged toward the inside of the foot.

3,275,003
MULTI-PURPOSE RETENTION CLIP
Coleman R. Chamberlin, Thompson Ridge, N.Y.
(P.O. Box 122, Newburgh, New Windsor, N.Y.)
Filed Jan. 30, 1964, Ser. No. 341,201
1 Claim. (Cl. 129—16.7)

A clip assembly for a cylindrical object, comprising a flat article having a straight edge, a tab formed from a pliable rectangular sheet metal body folded in half along a transverse line to define two juxtaposed panels, said article having an end portion disposed between said panels with registering holes in the panels and said end portion, rivets engaged in the registering holes securing said panels and said end portion of the article together with a major portion of the tab extending outwardly of said edge of the article, said tab having a centrally located keyhole-shaped notch opening inwardly and longitudinally thereof from the line of said fold, said tab having two loops at the fold line spaced apart by said notch, a generally U-shaped spring clip interposed between said panels and bordering said notch, said clip having a straight bight, a pair of outwardly bowed leg portions adjoining opposite ends of the bight, a pair of inwardly bowed other leg portions adjoining the outwardly bowed leg portions, and a pair of feet extending in aligment in opposite directions outwardly of ends of the respective other leg portions, said feet being slidably engaged in said loops respectively, said tab having a tongue folded inwardly at an inner end of said notch on one panel and enclosing said bight of the clip to prevent lateral displacement of the clip, said outwardly bowed leg portions extending inwardly of the notch and defining a seat for said cylindrical object when inserted laterally into the notch, said inwardly bowed other leg portions extending inwardly of the notch to serve as camming elements spreading apart for admitting said object into the notch and then retracting to serve as abutments for holding said object in the notch, said tongue disposed between said panels and overlapping the edge of said end portion of the article between the panels.



3,275,004
SUSPENSION FILING SYSTEM FOR FOLDERS AND OTHER DOCUMENT CONTAINERS
Georg Alfred Zippel, Muhlweg, Altdorf, near Nurnberg, Germany
Original application Apr. 19, 1960, Ser. No. 23,195, now Patent No. 3,165,104, dated Jan. 12, 1965. Divided and this application July 8, 1964, Ser. No. 381,007
1 Claim. (Cl. 129—16.7)

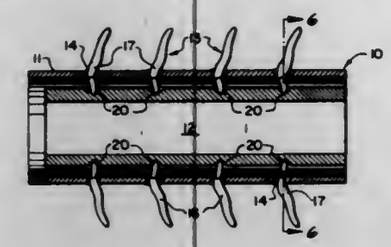
A suspension type filing device, comprising:
an elongated and rigid supporting rail of uniform cross section having first and second, parallel and substantially coplanar flange means extending along the opposite lengthwise sides thereof and projecting in opposite sideward directions, the remote edge portions of said flanges projecting upwardly thereof, said rail also having a rib projecting downwardly from the lower side of the supporting rail below said flange means;
a folder fabricated from sheet material and having an upper suspension edge portion;
a substantially flat and stiff suspension member secured to said suspension edge portion, said member having a recess opening through the upper edge thereof, said recess being defined by a bottom edge, a pair of spaced, side edges and a pair of carrier noses extending toward each other from the upper ends of said side edges, one of said side edges being longer than the other and the bottom edge of said recess sloping upwardly from the bottom end of the longer side edge to the bottom end of the shorter side edge, said carrier noses having downwardly extending beads along their adjacent edges and the distance between the remote sides of the beads on said carrier noses being approximately equal to the distance between adjacent sides of the edge portions on said flange means, said rail being relatively movable transversely thereof into said recess and into a position with respect thereto so that said noses are respectively engaged by and supported upon said flange means with said beads between said edge portions, said adjacent sides of said edge portions being closely adjacent said beads to oppose movement of said suspension member transversely of said rail when said rail is in said position, the distance between at least a portion of said one side edge and the one carrier nose adjacent said other side edge of said recess being greater than said distance between the remote edges of said flange means on said rail;
said rib extending downwardly below said flange means into contact with a central portion of said bottom edge when said flange means are in supporting positions beneath said carrier noses, whereby pivoting of said suspension member and said folder around the lengthwise axis of said rail is positively opposed, said rail being relatively movable within said recess from said supporting position toward said one side edge so that said rib is moved away from said central portion of said bottom edge and the flange means is moved from beneath the one carrier nose, whereby said folder can be moved downwardly away from said rail.

3,275,005
LOOSE-LEAF BINDERS HAVING PIVOTABLE RINGS
Georges Emmanuel Cott, Enghien les Bains, France, assignor to Societe Anonyme Reliure Industrielle S.T.D., Seine et Oise, France, a corporation of France
Filed Oct. 28, 1964, Ser. No. 407,185
Claims priority, application France, Oct. 31, 1963, 952,530, Patent 1,383,043
7 Claims. (Cl. 129—24)

1. A loose-leaf binder comprising a flat support member and at least two rings pivotally coupled to said support member for receiving loose sheets, each ring comprising first and second tubular elements, and a transverse member rigidly fixed to each of said elements at extremities thereof, said transverse member being mounted on said support member for pivotal movement to locate said ring in first and second positions, said first element and said transverse member being co-planar, said second element comprising a first portion co-planar with said first element and with said transverse member, an elbow on said portion, and an arcuate, substantially semi-circular portion coupled to said elbow, said arcuate portion being located in a plane parallel to said transverse member and forming, in said first position of said ring, a continuous slide-track for perforated sheets threaded on said ring, said arcuate portion comprising an elbowed extremity located in alignment with said first element and separated therefrom to define a gap through which the sheets may be extracted from said ring or inserted

thereon when said ring is in said second position, said arcuate portion in said first position being in a plane perpendicular to the plane of said support member while said first element, first portion and elbowed extremity are in said plane of the support member, whereas in said second position said first element, first portion and elbowed extremity are pivoted out of the plane of said support member so that said gap is disposed for said extraction and insertion of sheets.

3,275,006
SMOKING PIPE
Earl Wayland Krizan, 5317 Wooten Drive, Fort Worth, Tex.
Filed Sept. 3, 1964, Ser. No. 394,209
4 Claims. (Cl. 131—183)

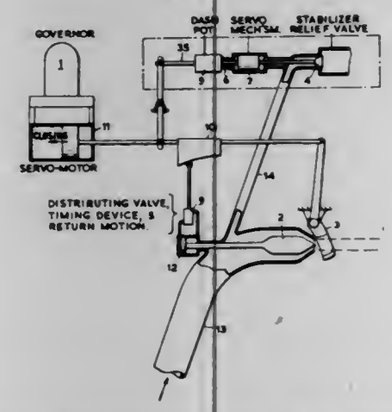


1. In a smoking pipe including a bowl, a ring within said bowl around the inner wall thereof, a perforated disc transversely received in said ring, a lift arm connected with an edge of the disc and extending upwardly to the rim of said bowl, means slidably receiving and guiding said arm and connected disc, and a cylindrical tobacco cartridge received in said ring above said disc, said ring being tapered downwardly and inwardly and the peripheral portion of the lower end of said cylindrical cartridge being dimensioned to engage the innermost portion of said tapered ring.

3,275,007
SELF-GRIPPING HAIR CURLER
William E. Thackeray, South Ogden, Utah, assignor to Norman F. Agricola, Ogden, Utah
Filed Dec. 9, 1963, Ser. No. 329,104
8 Claims. (Cl. 132—40)

1. A hair curler, comprising a roller tube; gripping means at all times extending through the wall of said roller tube; actuator means in engagement with said gripping means; and cooperative locking means on said tube and said gripping means whereby reciprocation of said actuator means between first and second extreme

positions through said tube moves said gripping means between a first positive locked position protruding from



the tube and a second positive locked position lying substantially flat against the outer surface of said tube.

3,275,008

REGULATION OF HYDRAULIC TURBINES

Gleb Kerensky, Netherton, England, assignor to The English Electric Company Limited, London, England, a British company

Filed July 27, 1965, Ser. No. 475,047
Claims priority, application Great Britain, Feb. 27, 1959, 6,865/59; May 11, 1959, 16,041/59; June 26, 1959, 22,045/59
15 Claims. (Cl. 137—25)

1. A device for regulating water flow through a water turbine having a penstock for leading a flow of water to the turbine, comprising a governor, quantity control means connected to said governor to reduce the flow of water in the penstock on increase of speed sensed by said governor, first relief valve means connected to the penstock to vent water therefrom and connected to said governor to be operated thereby in the sense of opening on increase of speed, second relief valve means connected to the penstock to vent water therefrom, said second relief valve means having a stroke which is only a small part of said governor stroke and having a flow capacity which is only a small fraction of the flow capacity of said first relief valve means, and a yieldable connection between said second relief valve means and said governor to operate said second relief valve means in the sense of opening on increase of speed, and to allow said governor to over-run said second relief valve means when the latter reaches the end of its stroke.

3,275,009

PNEUMATIC CONSTANT SPEED CONTROL APPARATUS FOR POWER MACHINES

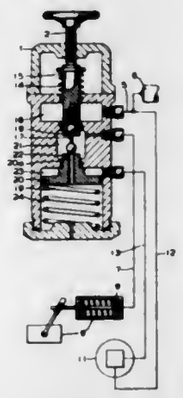
Josef Frania and Fritz Scheele, Hannover, Germany, assignors to Westinghouse Bremsen-Gesellschaft m.b.H., Hannover, Germany

Filed Feb. 27, 1963, Ser. No. 261,430
Claims priority, application Germany, Mar. 2, 1962, W 31,772
5 Claims. (Cl. 137—36)

1. A pneumatic constant speed control apparatus for automatically maintaining the revolutions per unit time of a power machine at selectively predetermined values, comprising:

(a) a first pressure chamber having walls and an output port therein,

(b) a first piston axially slidable within said first chamber and extending through one of said walls,



(c) an intake passageway within said first piston terminating at one end at an aperture at the end face of said piston, said aperture formed to comprise a valve seat within said passageway, and said passageway terminating at the other end at an aperture disposed away from the said end face, the latter said opening adapted to be communicated with a pressure supply line,

(d) an intake valve member in said passageway and adapted to seat internally on said aperture comprising a valve seat,

(e) a second pressure chamber having walls and disposed adjacent said first pressure chamber,

(f) a piston in said second pressure chamber and having an axially extending portion slidably extending through one of said walls of said second pressure chamber and into said first pressure chamber, said second piston disposed coaxially with said first piston,

(g) means in said second pressure chamber and disposed on one side of said second piston biasing said second piston to one extremity of its travel,

(h) an exhaust passageway extending through said second piston and terminating at one end in the end face of said axially extending portion to form a valve seat, and terminating at the other end at an aperture communicating with said second pressure chamber on the same side of said piston as the said biasing means,

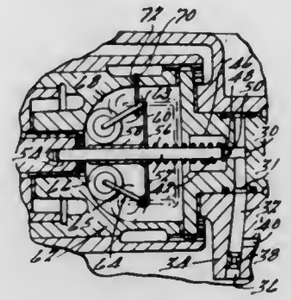
(i) an exhaust port at the end of said second chamber on the same side of said piston as the said biasing means,

(j) an exhaust valve member adapted to externally seat upon said valve seat in said second piston,

(k) means rigidly connecting said exhaust valve member to said intake valve member for closing said intake valve while opening said exhaust valve when said first and second pistons are spaced apart a distance exceeding a predetermined distance and for opening said intake valve while closing said exhaust valve when said first and second pistons are spaced apart a lesser distance than said predetermined distance,

(l) an input port in said second pressure chamber for supplying pressure to the pressure chamber on the side of said piston opposite said side having said biasing means,

(m) means connected between the pressure supply and the input port in said second pressure chamber for providing an output pressure to said input port, said output pressure being proportional to the revolutions per unit time of an engine, and



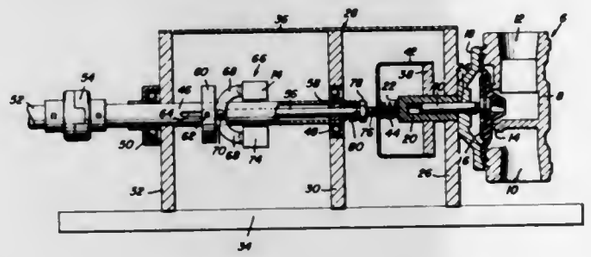
(n) pressure responsive throttle regulator means for providing fuel to said engine and connected to the output port of said first pressure chamber.

3,275,010

CENTRIFUGAL MASS TYPE GOVERNOR

Thomas R. Stockton, Northville, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed May 23, 1963, Ser. No. 282,702
2 Claims. (Cl. 137—53)



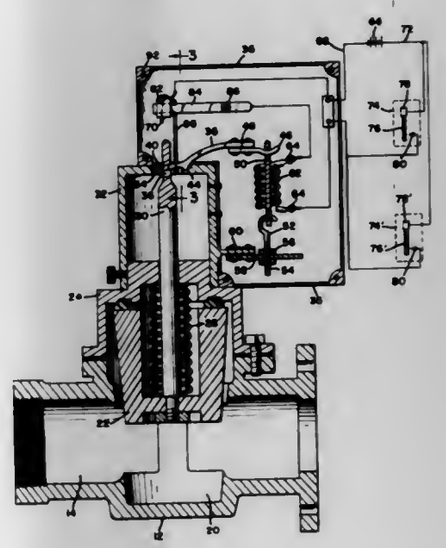
1. A fluid pressure governor assembly comprising, in combination, a rotating governor body, a conduit containing a fluid under a varying pressure, orifice means in an upstream portion of said conduit, a fluid exhaust opening in another portion downstream of said orifice means, and flow restricting valve means variably slidable into and out of said opening to control the rate of flow through said orifice means and the pressure of the fluid in said another portion, means biasing said valve means to close said opening, and substantially radially movable speed responsive flyweight members rotatable by said body and acting on and aiding said biasing means with forces changing as a function of the change in speed of rotation of said body, and a contoured cam surface engaged by said flyweight members in their radial movement for varying the bias on said valve means and the pressure in said another portion as a function of the speed of rotation of said shaft and the curvature of said cam surface.

3,275,011

MAGNETIC AND SPEED RESPONSIVE FLOW DEVICE

John D. Berezansky, Mineral Point, and George D. Gdovichin, Ebensburg, Pa., assignors to Jabco., Inc., a corporation of Pennsylvania

Filed July 31, 1964, Ser. No. 386,536
10 Claims. (Cl. 137—53)



1. A fluid flow control device comprising a valve unit including a fluid pressure-opened valve member, means comprising a permanent magnet for closing said valve member, and means responsive to the action of centrifugal force for actuating said magnet, said magnet including a slidable ring, the first-named means further comprising a slidable core operable by said ring and operatively engaged with the valve member, the second-named means comprising a tubular rotary shaft, a rod slidably mounted in the shaft, means operatively connecting said rod to the ring, a centrifugal governor mounted on the shaft, and means operatively connecting said governor to the rod.

3,275,012

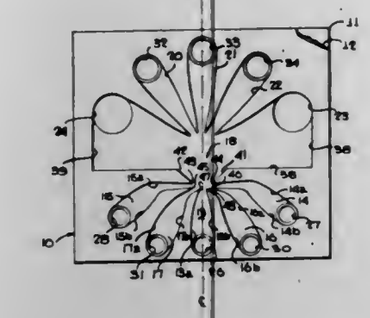
SAFETY VALVE SYSTEM FOR FLAMMABLE LIQUIDS AND GASES

Augustus A. Howard, 801 Marin Road, El Sobrante, Calif., and George H. Weise, 3121 Ricks Ave., Martinez, Calif.

Filed Apr. 10, 1963, Ser. No. 272,107
8 Claims. (Cl. 137—76)

1. A valve for arresting the flow of flammable fluid in response to an increase in ambient temperature proximate the valve comprising a body defining a conduit for the fluid, a sealing member transversely slidable in said body relative said conduit between a fluid flow arresting position and a fluid flow passing position, means for biasing said sealing member toward the fluid flow arresting position, a rod affixed to said sealing member and extending exterior said body for operating said member, said rod having an aperture therein adjacent the end thereof extending exterior said body, a lever having one end adapted to be received in said aperture, a portion of said body adjacent said aperture forming a fulcrum for said lever, a fusible link for securing the opposite end of said lever in a position to hold said sealing member in a fluid flow passing position against said biasing means, the fulcrum forming portion of said body releasably receiving said lever and defining a pivotal support for said lever when said lever is received in said rod aperture and secured by said fusible link, said lever being adapted so that the distance from the fulcrum to the link exceeds the distance of the fulcrum to the rod aperture, said fusible link being exposed to ambient conditions proximate said body, so that upon a rise of ambient temperature said fusible link fuses to permit said biasing means to move said sealing member to the fluid flow arresting position.

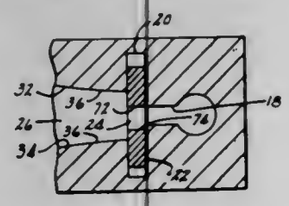
3,275,013



HIGH GAIN PURE FLUID AMPLIFIER

John R. Colston, Silver Spring, Md., assignor to Bowles Engineering Corporation, Silver Spring, Md., a corporation of Maryland

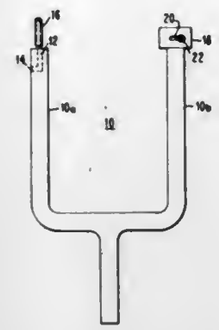
Filed Aug. 13, 1963, Ser. No. 301,743
8 Claims. (Cl. 137—81.5)



1. A pure fluid amplifier comprising a power nozzle having an orifice for issuing a constricted power stream therefrom, a chamber positioned downstream of said power nozzle for receiving the power stream, output means

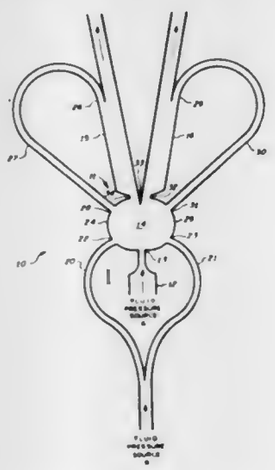
positioned downstream of said chamber for receiving fluid therefrom, a control nozzle having an orifice for issuing a control stream in interacting relationship with the power stream so as to effect displacement thereof relative to said

output means, and means positioned between the orifice of said power nozzle and the orifice of said control nozzle for venting a portion of the control flow to a region external to said pure fluid amplifier.



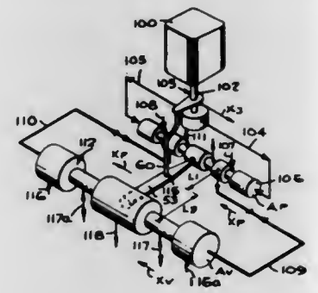
3,275,014
FLUID CONTROL MEANS
Emil Robert Plasko, Walled Lake, Mich., assignor to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 12, 1963, Ser. No. 308,390
2 Claims. (Cl. 137—81.5)

1. In a fluid switch comprising an outlet duct and two opposed fluid lock-on walls downstream therefrom defining two low pressure regions effective to selectively lock flowing fluid against the opposed walls by boundary layer action: the improvement comprising a slideway extending transversely across the outlet end of the duct; an orifice member movably mounted in said slideway; and mechanical power means operably arranged to move the orifice member between a first position in which it directs the fluid toward one of the low pressure regions and a second position in which it directs the fluid toward the other low pressure region; the orifice in said movable member defining two opposed orifice side edges, the spacing between the side edges being materially less than the spacing between the lock-on walls so that the downstream face of the orifice member forms separate steps between respective ones of the orifice side edges and respective ones of the lock-on walls; one step being shorter than the other in the first position of the movable member, and the other step being shorter than said one step in the second position of the movable member, whereby the fluid will lock onto that wall which is adjacent the shorter step.



3,275,015
TUNING FORK OSCILLATOR
Johann H. Meier, Vestal, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Oct. 29, 1963, Ser. No. 319,835
10 Claims. (Cl. 137—81.5)

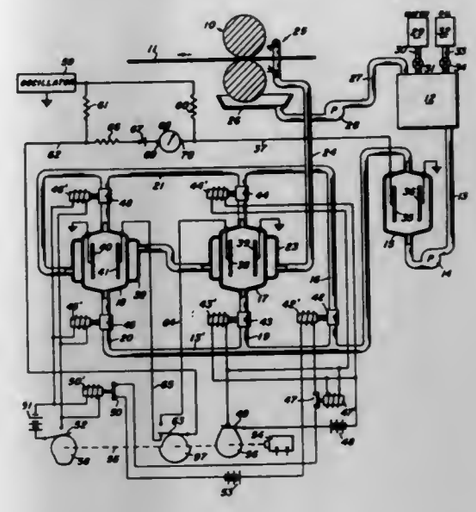
1. A fluid pressure oscillator comprising,
(a) a tuning fork having a predetermined natural frequency,
(b) means for applying fluid from a source of fluid pressure directly to the tuning fork exciting the tuning fork, and



(c) fluid gating means controlled by the tuning fork for controlling fluid from a fluid pressure source to produce fluid pressure pulses at a rate which is the natural frequency of the tuning fork.

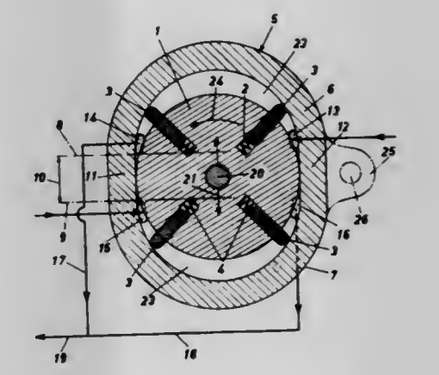
3,275,016
FLUID LOGIC DEVICE UTILIZING TRIGGERABLE BISTABLE ELEMENT
Orin L. Wood, Salt Lake City, Utah, assignor to Sperry Rand Corporation, Great Neck., N.Y., a corporation of Delaware
Filed Nov. 13, 1963, Ser. No. 323,451
1 Claim. (Cl. 137—81.5)

A pure fluid logic device comprising,
(a) a bistable pure fluid logic element having a power stream input channel for defining a power stream, first and second control stream input channels simultaneously responsive to a common control stream source for defining first and second control streams of substantialy equal magnitude respectively cooperative with said power stream, first and second output channels each defining a path of fluid flow, and a chamber formed by the intersection of said input and output channels whereby said power stream may flow through either one of said output channels in the absence of a control stream, said first and second output channels having respective first and second cusps adjacent to said chamber for providing a dynamically stable oscillating jet,
(b) first and second feedback control stream input channels for defining first and second feedback control streams respectively cooperative with said power stream,
(c) said first and second output channels being connected to said first and second feedback control stream input channels, respectively, and
(d) said first control stream and said first feedback control stream being cooperative to cause said power stream to be deflected in a first direction and said second control stream and said second feedback control stream being cooperative to cause said power stream to be deflected in a second direction.



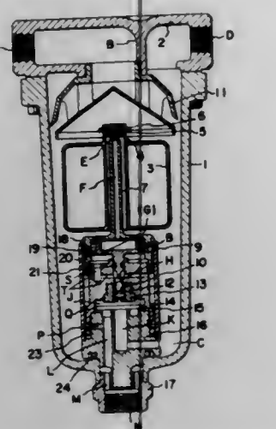
3,275,017
THREE-STAGE SERVO VALVE
Augustus P. Henry, Camarillo, Calif., assignor to American Brake Shoe Company, New York, N.Y., a corporation of Delaware
Filed Mar. 3, 1964, Ser. No. 349,002
6 Claims. (Cl. 137—83)

1. A three-stage servovalve comprising a first-stage valve, said first-stage valve including a fluid input port and a fluid output port in said first-stage valve and a pair of passageways connected to said first-stage valve, said first-stage valve including means responsive to a signal force applied to said first-stage valve to valve fluid from said input port into one of said passageways and from the other of said pasageways to said outlet port from said first-stage valve, a second-stage valve, said second-stage valve including a spool, control pressure chambers one at each end of said spool, said passageways connected to said chambers, a fluid inlet port and a fluid return port in said second-stage valve, a pair of control pressure passageways connected to said last named fluid inlet port and to said fluid return port, said second-stage spool valving fluid from said last named inlet port to one of said last named passageways and from the other of said last named passageways to said last named return port, a third-stage valve, said third-stage valve including a spool, a pair of control pressure chambers one at each end of said third spool, said last named passageways connected to said last named control pressure chambers, a fluid inlet port and a a fluid return port in said third-stage valve and a pair of load ports in said third-stage valve, said third-stage spool valving fluid from said last named input port to one of said load ports and from the other of said load ports to said last named return port, force feedback means from said second and third-stage spool to said first-stage valve.



3,275,018
APPARATUS FOR MEASURING AND CONTROLLING THE CONCENTRATION OF ROLLING OIL
William L. Roberts, Murrysville, Pa., assignor to United States Steel Corporation, a corporation of Delaware
Filed Feb. 15, 1963, Ser. No. 258,798
15 Claims. (Cl. 137—88)

1. The combination with a system for circulating a quantity of two nonmiscible liquids of substantially different dielectric constants, of a first chamber in said system through which said liquids circulate continuously and having capacitor elements therein, a second chamber having capacitor elements therein, means for alternately connecting said second chamber to said system and isolating it therefrom, a bridge circuit including the capacity of the liquid between the elements of said first chamber, and



means successively operating said connecting means first to fill said second chamber with liquid and then isolate it from the system, and means effective a predetermined time after filling and isolation of said second chamber to connect the elements of said second chamber in said bridge circuit.

3,275,019
DOSAGE APPARATUS
Karl Ivar Edwardh, Linnegatan 4, Goteborg, Sweden
Filed May 31, 1963, Ser. No. 284,618
Claims priority, application Sweden, June 1, 1962, 6,170/62
4 Claims. (Cl. 137—99)

1. A dosage device for fluids comprising a closed rotor housing, said housing being formed by a middle hollow portion open at its opposite ends, said ends lying in a pair of spaced parallel planes, and a hollow half-cylinder attached to each of said ends, a cylindrical rotor having a plurality of feeding means movably mounted on said rotor and biased to engage a wall formed in said housing, an inlet and an associated outlet for each half cylinder located adjacent the respective planes, the inlet and the outlet of one half cylinder lying on opposite sides of a transverse plane at right angles to said first mentioned planes, said rotor being rotatable about an axis adjustably supported relative to the housing for relative movement approximately at right angles to said parallel planes.

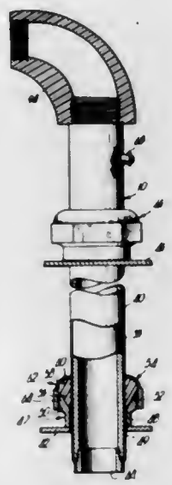
3,275,020
AIR TRAP
Katsuji Fujiwara, 191 Nishitani Hiraoka-cho, Kakogawa-shi, Japan
Filed June 16, 1965, Ser. No. 464,463
Claims priority, application Japan, July 22, 1964, 39/42,237, 39/42,238
4 Claims. (Cl. 137—195)

1. An air trap for discharging liquid separated from compressed gas lines, such as compressed air lines, said air trap comprising, in combination, a housing including an inlet for liquid-containing compressed gas, a gas outlet, a liquid discharge outlet and a liquid sump in communication which said inlet; a floating disc valve controlling communication between said sump and said liquid discharge outlet, and subjected on one surface to air under pressure and on its other and seating surface to liquid in said sump; float means displaceable in said sump in accordance with the liquid level therein; means, including said one surface of said disc valve, defining a pressure chamber normally containing gas under pressure; gas pressure responsive operating means operable to open said disc valve; means biasing said operating means to an inactive position in which it is ineffective on said disc valve; a normally closed pilot valve controlling communication between said sump and said operating means; and gas bleed-off means connecting said operating means to said liquid discharge outlet; said float, when the liquid in said sump attains a first predetermined level, opening said pilot valve for the gas pressure in said sump to actuate said operating means to open said disc valve to connect said sump to said liquid discharge outlet and, when the liquid in said sump falls to a second predetermined level, closing said pilot valve for bleeding of gas from said operating means for movement thereof to its inactive position by said biasing means; said disc valve, when said sump is substantially emptied of liquid, being subjected to gas flow over said one surface to increase the pressure in said chamber, for biasing of said disc valve to the closed position by the pressure difference corresponding to the difference in velocity between flowing gas and flowing liquid.

3,275,021
COMBINED GAS INLET CONDUIT AND ELECTRODE FOR LIQUID CONVEYING APPARATUS
Compere Loveless, Overland Park, Kans., assignor to Union Tank Car Company, a corporation of New Jersey
Continuation of application Ser. No. 169,449, Jan. 29, 1962. This application Feb. 10, 1964, Ser. No. 343,816
11 Claims. (Cl. 137—209)

1. In apparatus for pneumatically conveying liquid material containing surface-adhering solids, such as sewage and the like, comprising:

(A) an electrically grounded receptacle for accumulating said material and having a material inlet and a material outlet;



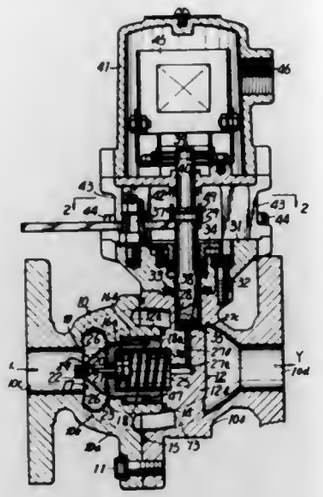
(B) a source of pressurized gas and a gas inlet conduit to said receptacle for ejecting said material through said outlet;

(C) an electrical circuit comprising a source of electrical energy, an electrode for sensing a predetermined level of said material, and electrically energized means for controlling flow of said pressurized gas; and

(D) the improvement wherein said gas inlet conduit and electrode are combined to comprise:

(1) hollow tubular means including an electrically conductive end extending into said receptacle,

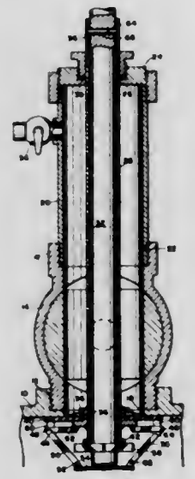
(2) means electrically insulating said end from said receptacle,



(3) means connecting the interior of said hollow tubular means to said source of pressurized gas,

(4) said hollow tubular means having an interior diameter large enough to admit pressurized gas into said receptacle at a rate sufficient to eject said material from said apparatus, said pressurized gas also serving to remove adhering solids from said end, and

(5) means electrically connecting the interior of said end to said circuit so as to complete said circuit by grounding through material above said predetermined level contacting an electrode surface, defined by the interior of said end, of sufficient area to increase the life thereof by promoting low current density.



3,275,022
VALVE ASSEMBLY
Hiroto Kobayashi and Kosaku Aibara, Kawasaki, Japan, assignors to Kabushiki Kaisha Keihin Seiki Seisakusho, Kawasaki, Japan, a corporation of Japan
Filed Jan. 4, 1963, Ser. No. 249,417
2 Claims. (Cl. 137—221)

1. In a pilot-operated valve assembly, the improvement comprising a valve body having a fluid inlet passage and a fluid discharge passage, a hollow piston slidably mounted in said body with a sufficient gap therebetween so as to cause said piston to assume a floating condition when fluid flows through said gap, said piston comprising a hollow cylindrical element having an enlarged flange portion and a cone piece detachably fixed thereto, a pilot fluid passage extending through said cone piece, and said valve body and providing a flow path from said fluid inlet passage, through said hollow cylindrical element to said fluid discharge passage, a solenoid operated plunger for opening and closing the pilot flow passage at the downstream end thereof, a first sealing ring mounted on said hollow cylindrical element and abutting said enlarged flange portion, a second sealing ring mounted between said cone piece and said hollow cylindrical element so that when the valve assembly is in a closed position said first sealing ring will prevent

fluid flow through said gap between said valve body and said hollow piston and said second sealing ring will prevent fluid flow between said cone piece and said inlet passage.

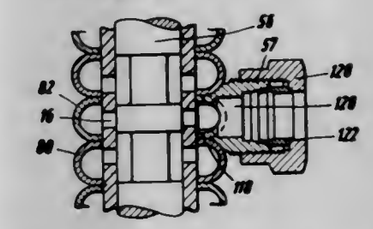
3,275,023
TEMPORARY SEALING MEANS FOR CONDUIT UNDER PRESSURE
Morris M. Raspante, 5908 Michael St., San Diego, Calif.
Filed Feb. 17, 1964, Ser. No. 345,414
4 Claims. (Cl. 137—315)

1. Apparatus for temporarily sealing an opening in a chamber containing fluid under pressure facilitate removal of a valve closing said opening, said apparatus comprising:

a sleeve member;

means on one end of said sleeve member for connection to the valve on the side thereof remote from said chamber;

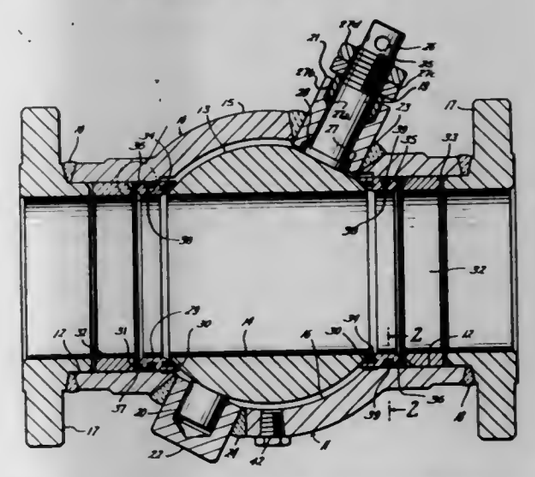
closure means on the other end of said sleeve member;



an elongated hollow support member extending through said closure means in sealing relation therewith;

a rod slidably mounted in said support member;

a thin disc of flexible material constituting an annular seal secured adjacent one end of said support member;

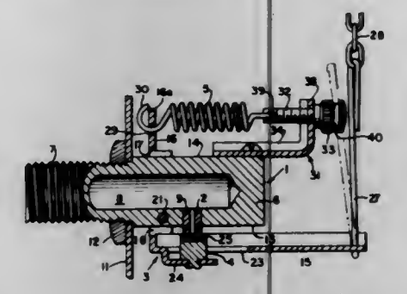


and clamping means connected between adjacent ends of said rod and said support member for engaging and holding the periphery of said thin, flexible annular seal in engagement with the inner wall of said chamber adjacent and surrounding said valved opening.

3,275,024
CASINGS FOR VALVE ASSEMBLIES
Otto Kracht and Hans Schumacher, Werdohl, Germany, assignors, by mesne assignments, to Kadron G.m.b.H., a corporation of Switzerland
Filed Apr. 6, 1964, Ser. No. 357,553
Claims priority, application Germany, Apr. 11, 1963, K 49,462
14 Claims. (Cl. 137—315)

1. A valve assembly comprising control bushings including control pistons, tubes interconnecting said control bushings, said tubes having at least two flat walls extending parallel to each other, said flat walls being provided with apertures the main axes of which extend substantially perpendicularly to the surfaces of said flat walls, flat walls of neighboring tubes extending in parallel relationship to each other, said control bushings penetrating through said apertures of said tubes and being soldered to said tubes.

3,275,025
BALL VALVE
Ludwig R. Kowalski, Belleville, N.J., assignor to Cameron Iron Works, Inc., Houston, Tex.
Filed Oct. 16, 1963, Ser. No. 316,598
6 Claims. (Cl. 137—330)



1. A valve, comprising a body having a flowway therethrough, a ball-shaped plug rotatably mounted within the flowway for controlling flow therethrough, an annular seat rotatably mounted about its axis within the flowway and engaging at its inner end with said plug, the axis of rotation of said plug being disposed at an acute angle with respect to the axis of the seat so that the frictional engagement of the plug with the inner end of the seat during rotation of the plug in one direction will urge said seat in one rotational direction about its axis and during rotation of the plug in the other direction will urge said seat in the other rotational direction about its axis, and means providing greater resistance to the urging of said seat in said one direction than in said other direction.

3,275,026
POULTRY WATERING VALVES

James B. Godshalk, Chester Springs, Pa., assignor to Fox Products Company, Philadelphia, Pa., a corporation of Pennsylvania

Filed Apr. 17, 1964, Ser. No. 360,599
5 Claims. (Cl. 137—408)

1. In a poultry watering valve of the type described, the combination of

an elongated valve body having

a transverse shoulder intermediate its ends and facing one end of said body,

a longitudinal bore opening through said one end, and

a lateral opening communicating with said bore and located between said shoulder and the other end of said body;

fastener means engageable over said one end of said body to cooperate with said shoulder for securing said body to an upright wall member of a watering receptacle,

said body extending generally horizontally when so secured and said lateral opening then being directed downwardly;

a rigid operating lever comprising first and second arms,

said first arm extending generally transversely of said body between said shoulder and said lateral outlet and having an end portion above said body and another portion below said body,

said second arm extending beneath said body from said other portion of said first arm and terminating in a free end projecting beyond said other end of said valve body,

said free end being equipped with means for attachment to a suspension member for supporting the combination of the watering receptacle and valve via said lever;

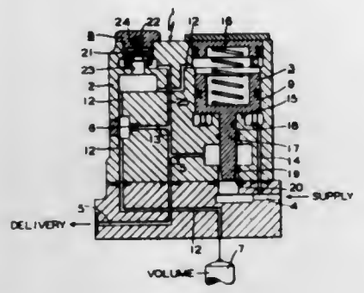
pivot means engaged with said first arm and said body and mounting said lever on said body for pivotal movement about a horizontal axis extending transversely of said body;

a fixed valve element carried by said body at said lateral opening and having an orifice disposed to discharge water downwardly into the receptacle;

a movable valve element carried by said second arm of said lever and projecting upwardly toward said body,

said movable valve element being so located as to engage said fixed valve element and close the valve when said second arm of said lever swings upwardly toward said body;

fixed bracket means secured to said body and having an upright portion spaced from said end portion of said first arm in the direction of said other end of said body; and



a tension spring onnected between said upright portion of said bracket means and said end portion of said first arm of said lever,

said spring extending generally parallel to and above said body and biasing said lever in a direction tending to swing said second arm downwardly away from said body.

3,275,027
REGULATING VALVE DEVICE

Richard L. Wilson, Level Green, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed June 19, 1964, Ser. No. 376,327
4 Claims. (Cl. 137—489)

1. A fluid flow regulating device comprising:

(a) a casing having

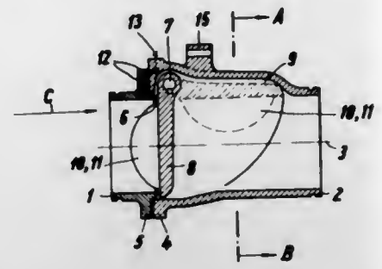
(i) a supply passage adapted for connection to a source of fluid supply under pressure,

(ii) a delivery passage adapted for connection to a fluid pressure responsive apparatus, and

(iii) a third passage communicating said fluid supply passage with said delivery passage,

(b) means for varying the size of said third passage increasingly and decreasingly in a range having a predetermined minimum, said predetermined minimum providing constantly open communication between said supply passage and said delivery passage,

(c) piston means responsive to the predominant sum of fluid force and spring-biasing force in a first chamber relative to the pressure in a second chamber to operate said size varying means to decrease the size of said passage, and responsive to a predominant fluid pressure in said second chamber over the fluid force and spring-biasing force in said first chamber to operate said size varying means to enlarge said third passage, said first chamber being communicated with said delivery passage, and said second chamber being communicated with said supply passage, and



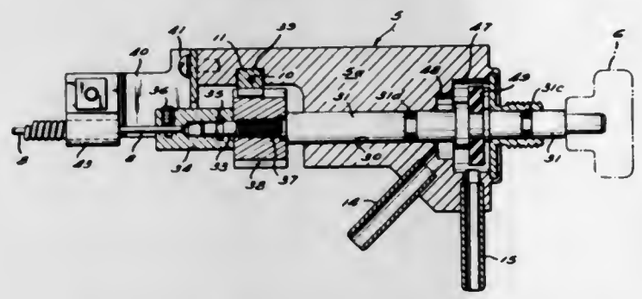
(d) time delay means disposed between said delivery passage and said first chamber for delaying transmission of pressure changes in said delivery pipe to said first chamber.

3,275,028
NON-RETURN VALVE ARRANGEMENT FOR PIPE-LINES

Karl Reppert and Erich Konrad, Zweibrucken, Germany, assignors to Dinglerwerke Aktiengesellschaft, Zweibrucken, Germany

Filed June 13, 1963, Ser. No. 287,707
Claims priority, application Germany, June 15, 1962, D 24,968
2 Claims. (Cl. 137—527.6)

1. A non-return valve comprising a casing having a straight flow path therethrough, said casing comprising two axially aligned sections, flange joint means detachably connecting said sections, an annular valve seat on one section adjacent said joint, the other section having a recess at one side opening into said path, a transverse shaft rotatably mounted in said other section and projecting into said recess adjacent said joint, a flapper valve member fixed to said shaft and movable into engagement with said seat to close said flow path, said valve member being movable into and substantially filling said recess to provide an unobstructed flow path through said casing, a valve control lever removably received on said shaft exteriorly of said casing, and an exterior boss on one of said sections, said boss having an aperture there-



through, whereby upon removal of said lever from said shaft, said lever may be passed through said aperture to provide a handle for carrying said valve.

3,275,029
DASH CONTROL UNIT

Ellis M. Wellman, Erie, Pa., assignor to The Weatherhead Company, Cleveland, Ohio, a corporation of Ohio

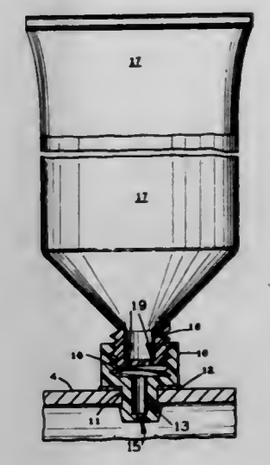
Filed Jan. 8, 1964, Ser. No. 336,412
5 Claims. (Cl. 137—560)

1. Automotive control apparatus comprising a body adapted to be mounted on the instrument panel of an automobile, said body having an axial bore therein to slidably and rotatably mount a control rod, said body having a pinion cavity opening through one side of the body, said control rod proportioned to extend at opposite ends of said bore, a control knob fixed to said rod at one end of the rod, a pinion fixed to the other end of said rod in said pinion cavity, a rack having teeth in mesh with said pinion, said body having re-entrant notches to receive and guide said rack for reciprocation transversely of the body in response to control rod rotation, means to attach a brake wire at that end of the control rod remote from the knob, said body having a vacuum inlet and a vacuum outlet, valve means carried by said rod to open and close said inlet with respect to said outlet in response to control rod reciprocation.

3,275,030
WATER TREATMENT APPARATUS

William R. Alvin, Coral Gables, Fla. (11681 SW. 72 Place, Miami, Fla.)

Filed June 1, 1964, Ser. No. 371,392
4 Claims. (Cl. 137—565)



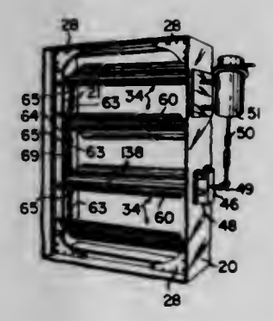
1. A water supply system comprising a motor driven pump having an inlet and outlet means,

a suction pipe connecting said inlet means with a source of water and pressure pipe means connecting said outlet means to a water distribution system,

a plug means secured in said suction pipe having a threaded bore therein and a coaxial metering bore of predetermined smaller diameter,

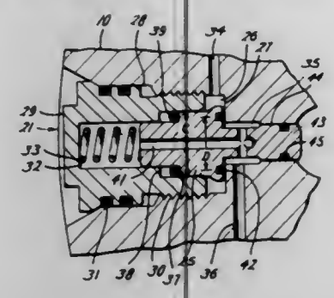
a collapsible container for retaining a quantity of liquid chemical having a threaded nozzle in mating engagement with said threaded bore,

at least one orifice through said nozzle into said container positioned for feeding said liquid chemical therefrom whereby said chemical will flow from said container through said metering bore of said plug



by suction into said suction pipe for dispersion in said water when the latter is pumped from said source through said suction pipe into said pressure pipe and said system when said pump is energized.

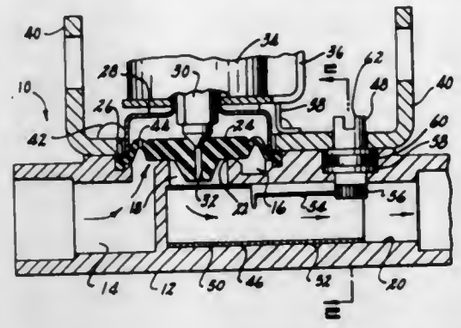
3,275,031
DAMPERS AND SEAL MEANS THEREFOR



Harold W. Alyea, Waukesha, and Edward D. Jurasinski and Eugene V. Fliss, Milwaukee, Wis., assignors to Johnson Service Company, Milwaukee, Wis., a corporation of Wisconsin

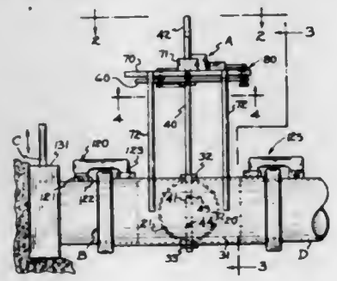
Filed Jan. 29, 1963, Ser. No. 254,671
11 Claims. (Cl. 137—601)

1. A damper blade comprising like sheet metal halves each formed with opposite edge seal-receiving grooves which are parallel to each other, the halves being so positioned and secured in back-to-back relation that the edge seal-receiving grooves cooperate to provide tubular seal receptacles, the outer edges of said seal-receiving grooves terminating short of meeting to provide slots of less width than the cross-sectional size of said seal receptacles, trunnions projecting from the end edges of the blade intermediate the grooves, and elongated flexible sealing members having enlarged cross-sectional portions in said receptacles and having external sealing portions projecting from said slots and of enlarged cross-section beyond the slots, at least one of said sealing members of each blade having its enlarged cross-sectional portions of different size, and said seal receptacles being of a cross-sectional size to receive either of said enlarged cross-sectional sealing member portions, whereby the sealing member is interchangeable in position to vary the amount which projects externally of the seal receptacle to thereby compensate for tolerance variations.



3,275,032
VALVE
David L. Gruller, Houston, Tex., assignor to Cameron Iron Works, Inc., Houston, Tex.
Filed Apr. 30, 1964, Ser. No. 363,732
8 Claims. (Cl. 137—608)

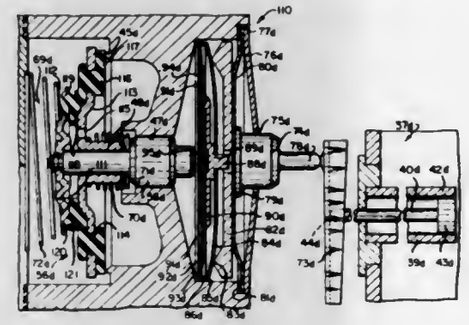
1. A manifold comprising a common conduit and a plurality of individual conduits connected to the common conduit to allow fluid to flow from one conduit to the other through the common conduit, and valve means located in each individual conduit for controlling the flow of fluid between each individual conduit and the common conduit, said valve means comprising a valve body having a cavity therein, the cavity being located so all of the fluid flowing through the individual conduit flows through the cavity thereby dividing the conduit into first and second portions connected by the cavity, a valve seat supported by the body and a valve member movably mounted in the body for movement into and out of sealing engagement with the valve seat to control the flow of fluid through the cavity, a seal member for sealing between the valve member and the cavity to isolate a portion of the cavity from the second portion of the conduit, a passageway connecting the isolated portion of the cavity with the first portion of the conduit; a pressure face on the valve element located to allow the seal member to move into and out of engagement therewith depending upon which portion of the conduit contains the higher pressure so the higher pressure will always exert a force on the pressure face, urging the valve element toward the valve seat, the area of the pressure face being equal to the effective area of the valve member against which pressure in the two portions of the individual conduit acts urging the valve member away from the valve seat; means for moving the valve element out of engagement with the valve seat to allow fluid to flow through the conduit and resilient means urging the valve member into sealing engagement with the valve seat.



3,275,033
ADJUSTABLE LIQUID METERING MEANS FOR SHUT-OFF VALVES
James A. Kozel, Franklin, and Gerald L. McClure, Warren, Mich., assignors to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 3, 1963, Ser. No. 270,442
5 Claims. (Cl. 137—613)

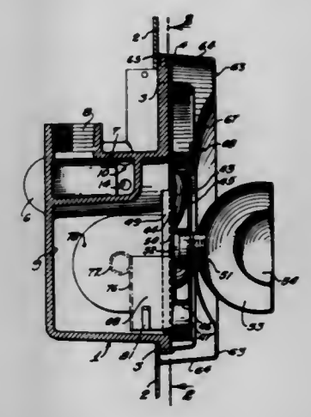
2. In a shut-off valve comprising a housing forming a horizontally directed entrance passage, an annular inlet chamber connected with said entrance passage, an outlet chamber concentric with the inlet chamber and cooperating therewith in defining a valve seat, and an exit passage directed horizontally from the outlet chamber in alignment with the entrance passage; a diaphragm extending across the inlet and outlet chambers to control flow past the valve seat; means for controlling the diaphragm comprising an upstanding armature guide having a flange overlying the peripheral edge area of the diaphragm, a plunger type armature within the guide, and a solenoid surrounding the guide; and a bracket positioned on the upper face of the housing in overlying relation to the armature guide flange whereby to retain the guide and diaphragm in place: the improvement comprising a metering element disposed in the exit passage for movement across the outlet chamber; and a rotary upstanding operator for the metering element mounted in the uppermost wall of the housing and extending downwardly into the exit passage, said bracket overlying part of the operator to retain same in its mounted position; said

operator being disposed in a portion of the housing located alongside the solenoid whereby the solenoid and operator are each accessible from above the valve housing; said metering element comprising a hollow thin-walled element engaging the exit passage surface for movement from a substantially fully closed position extending across the outlet chamber to a substantially fully open position approximating the full capacity of the shut-off valve.



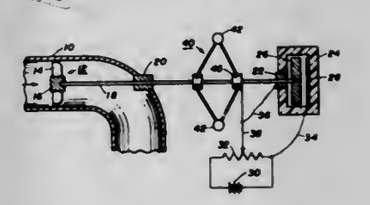
3,275,034
IRRIGATION VALVE
Fred S. Tadlock, 8 Jackson St., Woodland, Calif.
Filed May 10, 1963, Ser. No. 279,564
10 Claims. (Cl. 137—624.19)

1. A valve for the control of the flow of water in an irrigation line comprising: valve case means having a passageway extending therethrough for receiving a flow of water; a valve plate pivotally mounted in said passageway for blocking and releasing the flow of water; and a stem extending through said valve case means and secured to said valve plate for pivotal movement thereof; said valve plate having at least three successive positions, the first position wherein said valve is closed, a second position wherein said valve is open and a third position wherein said valve is closed; a control wheel spaced from said valve case means and secured to the extended stem so that the position of said valve plate will be varied by rotation of said control wheel; a mounting plate spaced from said valve case means and adjacent said control wheel; a plurality of outward extending support legs, each secured at one end to said valve case means and at the other end to said mounting plate; coil spring means connected between said mounting plate and said control wheel to rotatably urge said control wheel in one direction; a plurality of spaced movably mounted stop means connected to said mounting plate to engage cooperating stop structure on said control wheel and prevent spring driven rotation beyond predetermined positions; said mounting plate having a surface area spaced outside of



the external perimeter of movement of said stop structure on said control wheel; said first movably mounted stop means being constructed and arranged to cooperate with said stop structure to lock the wheel in said first valve position against rotation by the spring, and said second movably mounted stop means being attached to said mounting plate at the surface area spaced outside of the external perimeter of said movement of said stop structure to cooperate with said stop structure to lock said control wheel in said second valve position against rotation by the spring; said second stop means being related to the stop structure in such a manner that moving said stop means releases the wheel for rotation by said spring; third stop means connected in spaced relationship from said second movable stop means being adapted to position said plate means in said third position; and actuating means for sequentially moving said first and second stop means to release said control wheel to cause said plate means to sequentially move from closed to open and back to closed.

3,275,035
PLURAL SEQUENTIALLY OPERATED SNAP ACTION VALVES
Le Roy W. Freeby, Huntington Beach, and Wilbur F. Jackson, Rolling Hills, Calif., assignors to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware
Filed Nov. 20, 1962, Ser. No. 238,899
6 Claims. (Cl. 137—630.14)



1. In combination, a housing having a passage means leading from an inlet to an outlet, a supplemental valve seat disposed in said passage means and interconnecting said inlet with said outlet, a supplemental valve member having a resilient surface means cooperably with said supplemental valve seat and having a main valve seat interconnecting said inlet with said outlet, said supplemental valve member having aperture means passing therethrough and surrounded by said main valve seat, said main valve seat being formed of resilient material integral with said resilient surface means of said supplemental valve member, said supplemental valve member having opening means passing therethrough with a resilient member molded to said supplemental valve member and passing through said opening means to define said resilient surface means on one side of said supplemental valve member and to define said main valve seat on the other side of said supplemental valve member, a main valve member cooperable with said main valve seat and having a stem slidably passing through said supplemental valve member, a first spring disposed between said stem and said supplemental valve member to tend to maintain said main valve member against said main valve seat, a second spring disposed between said housing and said supplemental valve member to tend to maintain said supplemental valve member against said supplemental valve seat, a snap-action member for controlling opening movement of said valve members, said snap-action member when snapped over center in one direction only opening said main valve member, said snap-action member when further moved in said one direction opening said supplemental valve member, and a resilient amplifying member disposed between said snap-action member and said stem to cause said supplemental valve member to substantially snap open even though said snap-action member had previously been snapped over center.

3,275,036
SLIDING HANDLE MIXING VALVE
Lloyd Spencer, 220 Patrician Way, Pasadena, Calif.
Filed Oct. 7, 1965, Ser. No. 498,198
15 Claims. (Cl. 137—636.1)

1. A mixing valve, comprising:
(a) a pair of parallel valve units having cam follower elements for opening and closing said valve units;
(b) a cam structure movable in a predetermined plane traversing said cam follower elements; and
(c) means limiting said cam structure to an essentially triangular path in said plane, whereby said cam follower elements describe corresponding triangular paths on said cam structure, the areas within said paths on said cam structure forming cam areas contoured to effect movement of said cam follower elements individually, in unison, or in opposition thereby to cause corresponding opening and closing of said valve units.

3,275,037
FLUID FLOW CONTROL DEVICE
Peter Andress, Jr., Arlington Heights, Ill., assignor, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Filed Jan. 10, 1964, Ser. No. 336,978
9 Claims. (Cl. 138—46)

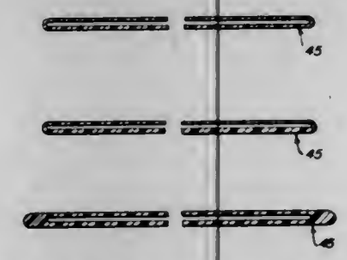
1. A fluid flow control device comprising a conduit, rotor means disposed in said conduit for rotation by the axial flow of a fluid through said conduit, a coupling including a rotatable member and a nonrotatable member having spaced opposing surfaces and a field-responsive fluid confined between said surfaces, said rotatable member being mechanically connected to said rotor means and rotatable therewith, means for applying to said field-responsive fluid a field adapted to increase the viscosity thereof, and governor means responsive to the rate of fluid flow in said conduit to vary the field applied to said field-responsive fluid.

3,275,038
REINFORCED HELICALLY CORRUGATED FLEXIBLE HOSE

Fred T. Roberts and Robert E. Roberts, Wilton, Conn., assignors to Fred T. Roberts & Company, Wilton, Conn., a partnership composed of Fred T. Roberts and Robert E. Roberts

Original application June 26, 1959, Ser. No. 823,085. Divided and this application June 3, 1964, Ser. No. 379,065

3 Claims. (Cl. 138—122)



1. A mold-formed helically corrugated reinforced hose comprising a molded tubular body of moldable elastomeric material having at least one tubular layer of stretchable open mesh fabric therein, said body being set in final molded form and providing a self-sustaining body having helically corrugated walls with the fabric thereof being in stretched condition to conform to the corrugations of the walls and with the elastomeric material extending through the mesh in the fabric and forming a smooth outer surface on the helically corrugated wall, a winding of resilient wire supported upon said smooth surface of said self-sustaining body and disposed in and conforming to the troughs of the helical corrugations, and a cover of elastomeric material extending over at least some of the winding of wire and bonded to the body to hold the wire in position thereon.

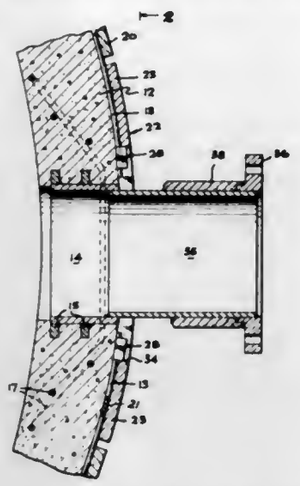
3,275,039
SEAMLESS EXTRUDED THERMOPLASTIC SELF-SUSTAINING LAY-FLAT CONTINUOUS TUBE

Herbert O. Corbett, Canandaigua, N.Y., assignor to National Distillers and Chemical Corporation, New York, N.Y., a corporation of Virginia

Filed Oct. 10, 1961, Ser. No. 144,253

2 Claims. (Cl. 138—148)

1. As an article of manufacture, a self-sustaining extruded seamless and lay-flat continuous tube of thermoplastic film, said tube comprising a pair of substantially parallel flat sheets of thermoplastic material, said sheets being relatively spaced from each other and joined along their longitudinal edges by substantially semicircular bead portions, at least one of said flat sheets and semicircular bead portions being of a different gauge from that of the remaining portions of said lay-flat tube.



3,275,040
OUTLET CONSTRUCTION FOR CONCRETE PIPE AND METHOD OF MAKING SAME

Delbert A. Hausmann, Glendale, and Alfred B. Szulc, Alhambra, Calif., assignors to American Pipe and Construction Co., Monterey Park, Calif., a corporation of California

Filed May 27, 1963, Ser. No. 283,442

11 Claims. (Cl. 138—176)

1. In an outlet construction for a concrete pipe having a concrete core body and wrappings therearound of high tensile wires under tension, an outlet sleeve in the core body providing an outlet opening therethrough, a saddle plate overlying the wires in a region about said opening and having an open area encompassing the opening in the pipe core body, and means cooperatively associated with the saddle plate securing the individual turns of wires in

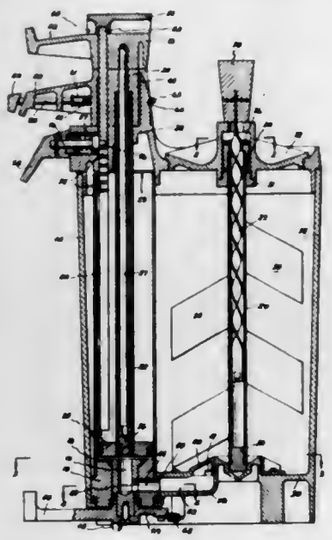
tension in the open area of the saddle plate at opposite sides of the opening in the pipe, said secured turns each being interrupted between its regions of being secured whereby the opening in the pipe is not obstructed.

3,275,041
BACTERIA-RESISTANT FABRIC

Beverly E. Williams, La Grange Park, Ill., assignor to Hodges Research and Development Company, New York, N.Y., a corporation of California

No Drawing. Filed Sept. 21, 1964, Ser. No. 398,087

12 Claims. (Cl. 139—424)



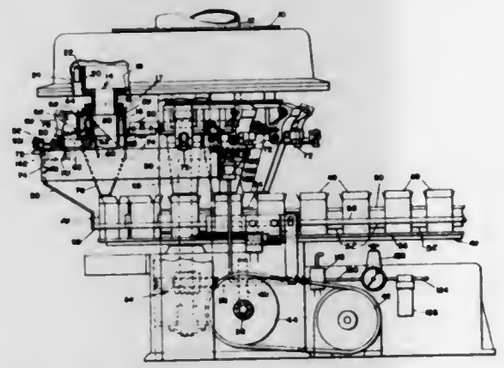
1. A fine-mesh lint-free fabric exhibting high resistance to microorganisms comprising yarns of ramie fiber, said yarns being single ply yarns twisted at least 10 t.p.i. and having a fine yarn count in excess of 13, the yarn density of said fabric in both directions being at least 40 yarns per inch throughout said fabric.

3,275,042
LIQUID DISPENSING APPARATUS

Atis Strazdins, 16 Dumfries Ave., Mount Ousley, Wollongong, New South Wales, Australia

Filed Sept. 17, 1964, Ser. No. 397,261

12 Claims. (Cl. 141—27)



1. Liquid dispensing apparatus comprising: a main measuring cylinder having a cover at one end and a liquid outlet at the other end, a main piston slidable in said main cylinder; a main piston rod whereon said main piston is mounted, which extends externally of and is slidable through said cover, and which is tubular thereby to consistute a fractional measuring cylinder; a first boss on the outer end of said main piston rod able to abut the outer face of said cover, a fractional piston slidable in said main piston rod, a fractional piston rod whereon said fractional piston is mounted and which extends externally of and is slidable through said first boss, a second boss on the outer end of said fractional piston rod able to abut the outer face of said first boss, an index rod which is slidable through said cover and both of said bosses and which extends externally of said second boss, a stop on the outer end of said index rod able to abut the outer face of said second boss, and means for holding said index rod in selected adjustment relative to said cover.

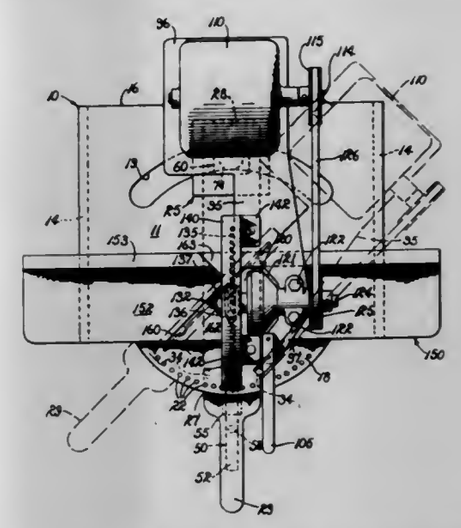
3,275,043
PACKAGING MACHINE

Geoffrey F. Dobbyn, Braintree, Mass., assignor to Pneumatic Scale Corporation, Limited, Quincy, Mass., a corporation of Massachusetts

Filed May 27, 1963, Ser. No. 283,220

6 Claims. (Cl. 141—142)

6. In a rotary volumetric filling machine, in combination, a plurality of measuring chambers mounted to be continuously moved in a rotary path, means for filling said chambers during their movement through one portion of said rotary path, a conveyer for presenting successive containers into operative position to receive the measured loads during their movement through another portion of said rotary path, each of said measuring chambers having a pivotally mounted shutter, means for opening said shutters including a stationary cam rail, a cam roll operatively connected to said pivotally mounted shutter for cooperation with said cam rail, said cam roll being mounted to move vertically into and out of cooperative engagement with said cam rail, control means including means for detecting the absence of a container on the conveyer, and means responsive thereto for effecting vertical movement of the roll to a position above and out of operative engagement with the rail when a container is found to be absent from the conveyer to receive said load.



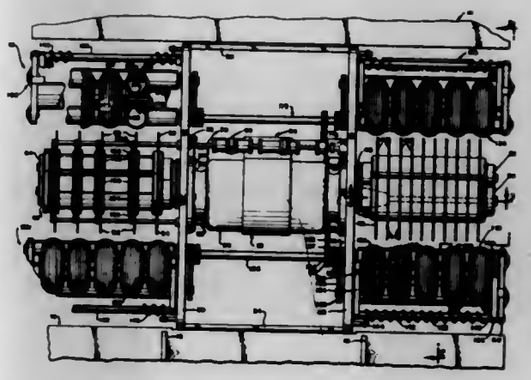
3,275,044
POWER DRIVEN MITER SAW

Edward J. Kisling, 4965 E. Tulare, Fresno, Calif.

Filed May 15, 1964, Ser. No. 367,741

4 Claims. (Cl. 143—6)

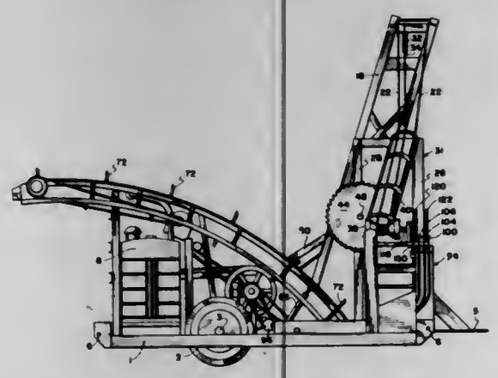
1. A power driven miter saw comprising a base having an arcuate slot therein; a miter box rigidly mounted on the base in a predetermined plane of reference and having a centrally disposed saw slot therein; a saw arm support assembly including a lower plate rotationally mounted beneath the base on a substantially vertical axis concentric with said slot in the base, and a substantially upright pedestal movably mounted on the base providing a depending guide portion extended through said slot in the base for connection to said lower plate; caster means on said lower plate and on said pedestal providing substantially frictionless movement against their respectively adjacent portions of the base; a saw arm having predetermined forward and rearward ends mounted at its rearward end on said pedestal for pivotal movement about a substantially horizontal axis; a saw blade rotatably mounted on said forward end of the arm above said miter box in a plane substantially normal to said plane of reference of the miter box with the plane of the blade passing through said axis of the lower plate of the support assembly and through said slot in the miter box to permit angular positioning of the blade with respect to said plane of reference; interlock means mounted on said lower plate selectively engageable with the base automatically releasably to hold said lower plate and the blade in said angularly adjusted positions; and motor means mounted on said rearward end of the arm having driving connection to said blade and being substantially heavier than said saw blade and said forward end of the arm so as normally gravitationally to lower said rearward end of the arm about said horizontal axis concurrently to raise the forward end thereof and the blade upwardly away from said miter box.



3,275,045
EDGER

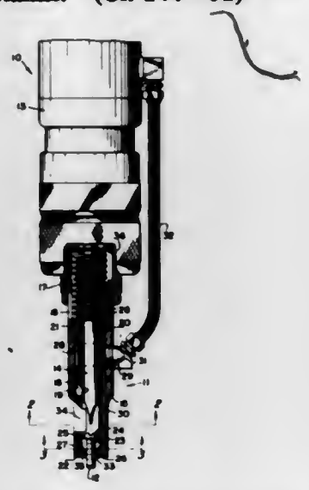
Howard K. Beeley, Eugene Oreg., assignor, by mesne assignments, to Klamath-Ward, Inc., Eugene, Oreg., a corporation of Oregon

Filed Mar. 2, 1964, Ser. No. 348,661



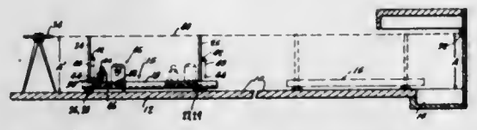
8 Claims. (Cl. 143—37)

1. In an edger,
a pair of side frame plates mounted in parallel, vertical positions, one of the plates having an opening therein,



a double ended motor having a pair of end plates,
one end plate being provided with a boss fitting in the opening,
the motor having a shaft having an end projecting through the opening,
means securing the end plates to the side frame plates to rigidly mount the motor on the side frame plates and rigidly secure the side frame plates against movement relative to each other,
a saw assembly including an arbor and a plurality of saws carried by the arbor,
and means for detachably securing one end of the arbor to the end of the shaft projecting through the opening.

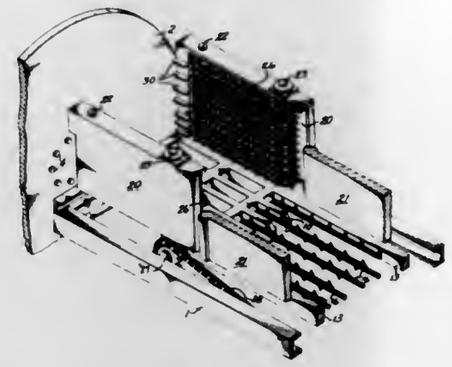
3,275,046
PORTABLE PULPWOOD CUT-OFF AND LOADING MACHINE
Thomas Ezell Moyers, Hugh C. Moyers, and Ashton P. Moyers, all of Rte. 1, Montrose, Ark.
Filed May 11, 1964, Ser. No. 366,525
5 Claims. (Cl. 143—46)



1. A portable cut-off and loading machine comprising a base frame, means on said base frame allowing movement thereof to different locations along the ground, an elevator conveyor unit mounted on said frame and extending from a lower position adjacent one end of said frame to an upper position above and beyond the other end of said frame, a first pair of spaced lugs projecting outwardly from said elevator conveyor and movable along said elevator conveyor from the lower end thereof to the upper end thereof in a substantially continuous circuit, a second pair of spaced lugs projecting outwardly from said elevator conveyor and being opposed and arranged in transversely spaced relation with respect to the first pair of lugs and movable from the bottom of said elevator conveyor to the top thereof in a substantially continuous circuit, an inclined table at said one end of said frame and inclined downwardly towards the lower end of said elevator conveyor, a rotatable spiked feed roller at one side of said frame adapted to move a log disposed thereon into said machine, a vertical abutment at the opposite side of said frame from said roller for stopping the advancement of said log, a pivotal saw support having a portion thereof movable towards and away from said log, a rotatable saw blade mounted on the end of said saw support adjacent said log and movable into and out of engagement with said log for cutting through said log, said log thereafter falling off said inclined table onto the elevator conveyor so as to be engaged by the spaced lugs thereon for movement from the lower end of said elevator conveyor to the upper end thereof from whence said log is discharged over the upper end of said elevator conveyor, a boom projecting vertically and transversely outwardly from said one side of said frame, a pulley means mounted to the upper end of said boom, a cable extending over said pulley and having a hook means at the outer free end thereof, a rotatable winch connected with the other end of said cable for winding up or paying out said cable whereby said hook means is engageable with a log for the purpose of directing said log into engagement with said feed roller.

3,275,047
FASTENER HOLDER FOR POWER TOOLS
Melvin L. Kulman, Sayre, Pa., assignor to Ingersoll-Rand Company, New York, N.Y., a corporation of New Jersey
Filed Aug. 19, 1964, Ser. No. 390,686
17 Claims. (Cl. 144—32)

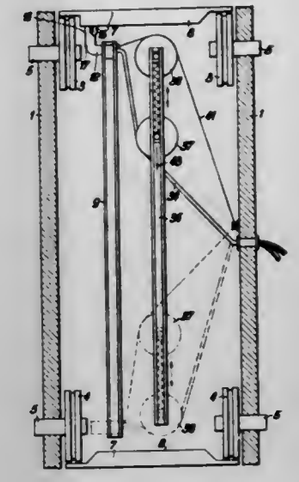
7. A fastener holder for a power tool having a fastener-engaging member mounted for rotation and rotatably driven by a rotary motor, said fastener holder comprising:
(a) a housing surrounding said fastener-engaging member and connected at one end to said power tool for axial movement relative to the latter,
(b) a recess in the distal end of said housing,
(c) said recess adapted to receive the head of a fastener therein,
(d) stop means in said recess to abut the head of said fastener, and
(e) passage means in said housing communicating with a source of pressurized air and with said recess to direct the pressurized air against the underside of the head of a fastener and thereby force and maintain the head against said stop means until the head is engaged by said fastener-engaging member.



3,275,048
APPARATUS FOR FINISHING SURFACES
Lowell E. Statler, Bellevue, Ohio (Clyde, Ohio), and Chauncey A. R. Keller, Clyde, Ohio
Filed July 6, 1961, Ser. No. 122,258
3 Claims. (Cl. 144—115)

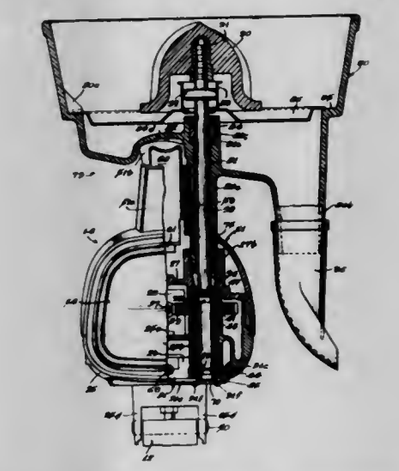
1. In a surfacing apparatus, in combination, a base member having a fore and aft end, a surface finishing instrumentality, electrically energizable motor means mounted on said base member, means mounting the surface finishing instrumentality on the fore end of said base member in such fashion that said instrumentality is reciprocable lengthwise relative to said base member and in contact with the surface to be surfaced, means driven by said motor means for recopricating said surface finishing instrumentality, and a plurality of supporting casters for the base member, said instrumentality including a head mounted transversely to the longitudinal axis of said base, a plurality of vertically-depending, side-by-side,

blade-like cutter elements adjustably carried on said head and means allowing said blade elements to individually move vertically responsive to surface irregularities.



3,275,049
APPARATUS FOR PRODUCING FIBROUS WAFERS OR FLAKES
John M. Gunn, 9010 NE. 37th, Bellevue, Wash. 98004
Continuation of application Ser. No. 203,245, June 18, 1962. This application Jan. 25, 1965, Ser. No. 427,676
1 Claim. (Cl. 144—176)

A wood flake-cutting machine comprising a continuously-rotating flake-cutting cutterhead carrying a flake-cutting knife, generally horizontal channel-shaped means defining a work feed passage extending into a position closely adjacent to said cutterhead, constantly-rotating feed chain sprockets supported at the end of said channel-shaped means adjacent to said cutterhead, feed chains extending along the bottom of said work feed passage, engaged with said feed chain sprockets and engageable with curved-side workpieces in such work feed passage, each having the length of its grain extending transversely of such work feed passage and a curved side downward, to move said workpieces transversely of their lengths along such passage, work-supporting and guiding blades at opposite upright sides of the work feed passage, disposed in substantially horizontal planes parallel to the work feed passage and extending between the location of said feed chain sprockets in the work feed passage and said cutterhead and into close proximity to the cutting path of said cutterhead knife, engageable simultaneously with opposite ends, respectively, of each workpiece for supporting such workiece independently of the bottom of the work feed passage and guiding such blade-engaged workpiece for substantially linear movement along the work feed passage to said cutterhead in a constant attitude relative to said cutterhead until virtually the entire workpiece has been cut into flakes, rotary-disk grooving cutters at opposite sides of the work feed passage located in advance of said blades along such passage and spaced from the bottom of the work feed passage corresponding to the spacing of said blades from the bottom of such passage, and hold-down means adjacent to said grooving cutters operable to hold a workpiece down in contact with said feed chains.

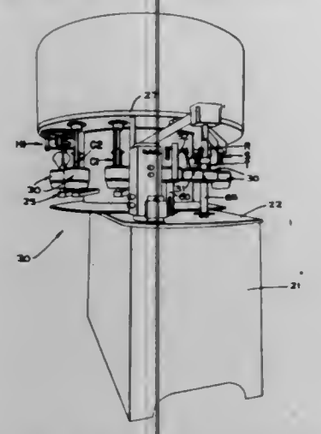


3,275,050
CONTINUOUS CHAIN PRESS FOR THE WOOD INDUSTRY
Walter Köhler, Gutersloh, and Willi Riesmeier, Lubbecke, Westphalia, Germany, assignors to Firma Ima-Klessmann K.G., a corporation
Filed Mar. 30, 1964, Ser. No. 355,744
10 Claims. (Cl. 144—281)

2. A steam-heated endless chain press for pressing wood sheets and the like comprising a frame, a hollow endless chain adapted to receive steam therein for heating it, guide means supporting said chain from said frame and guiding said chain for lengthwise movement in an elongated orbit, steam supply and discharge conduit means connected between said frame and said endless chain, and conduit guide means guiding portions of said steam supply

and discharge conduit means between their ends for reciprocation within the orbit of said endless chain in synchronism with orbital movement of the connections between said steam supply and discharge conduit means and said endless chain.

3,275,051
JUICE EXTRACTOR ATTACHMENT FOR MIXER
Ivar Jepson, Oak Park, and Gilbert R. Wolter, Elmhurst, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Jan. 10, 1963, Ser. No. 250,554
8 Claims. (Cl. 146—3)



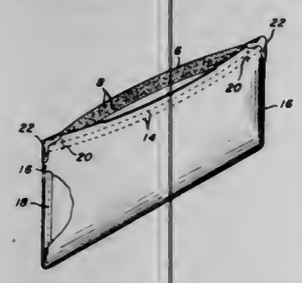
1. A citrus fruit juice extractor comprising a power unit including a housing having an upwardly directed post portion projecting from said housing, means in said housing defining a gear chamber including an upwardly directed projection disposed wholly within said housing, said projection being open at its upper end, rotatable means within said gear chamber accessible through the open upper end of said projection, means defining an opening in said housing adjacent said post portion aligned with the axis of said projection, a recess defined in said post portion adjacent said opening, a juice bowl having a depending portion, said depending portion being receivable in said recess and said opening and the lower end thereof being receivable in the open upper end of said projection firmly to support said juice bowl above said post portion, and a reamer in said juice bowl including a shaft rotatable within said depending portion, the lower end of said shaft being drivingly engageable with said rotatable means.

3,275,052
METHOD OF SECTIONIZING CITRUS FRUIT

Wilber C. Belk, Lakeland, Fla., assignor to FMC Corporation, a corporation of Delaware

Original application Mar. 9, 1961, Ser. No. 109,798. Divided and this application Aug. 17, 1964, Ser. No. 395,350

10 Claims. (Cl. 146—236)



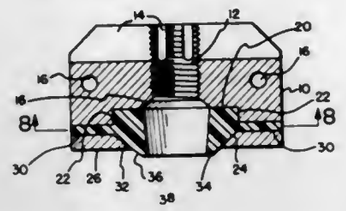
1. In a method of sectionizing peeled citrus fruit having a plurality of generally pie-shaped segments disposed around a central axis, each segment being enclosed by two generally radially disposed membranes, the steps of holding a fruit in fixed position, making a plurality of cuts around the blossom end of the fruit, each cut extending through the peripheral membrane and into a portion of one of the meat segments and extending from one radial membrane to the adjacent membrane, removing the loose material from said cuts to provide short paths between the radial membranes, and making cuts between each radial membrane of the fruit and the adjacent meat segment, each cut extending from the point where one of said paths meets a membrane to the periphery of the fruit.

3,275,053
PURSE AND METHOD OF MANUFACTURING THE SAME

Joseph A. Kabana, Moon Township, Allegheny County, Pa. (144 Delaware Drive, Coraopolis, Pa. 15108)

Filed Mar. 16, 1964, Ser. No. 352,217

7 Claims. (Cl. 150—42)



1. A purse comprising a one piece member folded upon itself with the top thereof being open, a side seam connecting said one piece member along each side thereof from the bottom to the top thereof, opposed folded over portions on the inside of the one piece member at the top thereof, a flat female closure member fastened to one of the said folded over portions and extending to within a short distance of the sides of the purse, a flat male closure member fastened to the other of the said folded over portions and extending to within a short distance of the sides of the purse, and a transverse bar tack adjacent each end of said closure members inwardly of the adjacent side seam and extending through the purse including the closure members and folded over portions, said closure members closing the said open top when pressed together.

3,275,054
COMPRESSION LOCKING NUT

David Ohl, Rochester, N.Y., assignor, by mesne assignments, to Standard Pressed Steel Co., Jenkintown, Pa., a corporation of Pennsylvania

Filed Dec. 15, 1964, Ser. No. 418,431

10 Claims. (Cl. 151—5)

1. A compression locking nut comprising a metallic nut body having a central bore threaded throughout a substantial part of the length of the nut body from the top face thereof and having an unthreaded cavity of substantially larger diameter than said threaded bore extending a substantial distance through another part of the length of the nut body and opening through the bottom face of the nut body, and a body of a plastic elastomer material which has memory positioned within said unthreaded cavity, the nut being characterized in that

(a) said unthreaded cavity is undercut so as to be of substantially larger diameter at a point spaced axially inwardly from said bottom face than its diameter at said bottom face; the opening in said bottom face and the undercut portion of said cavity being connected by a section of frusto conical shape that has a total included angle in the range of 70° to 120° extending from the outer face toward the undercut portion;

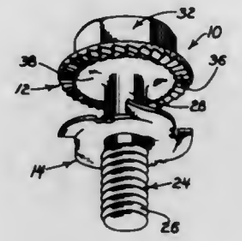
(b) said nut body has at least one lateral passageway extending from said unthreaded cavity approximately radially outwardly to an outer lateral face of said nut body;

(c) said body of plastic elastomer material has a central axial opening which, throughout its entire axial length, is slightly larger in diameter than the maximum diameter of the threads of a bolt on which the nut is to be used;

(d) said body of plastic elastomer material has an external periphery fitting tightly in the undercut portion of said unthreaded cavity and has an integral portion extending laterally into and filling said lateral passageway in said nut body, the tight fit of said plastic body in said cavity and the presence of said integral portion of said plastic body extending into said passageway together serving to anchor said plastic body permanently in said nut body and to prevent separation thereof under conditions of repeated use, removal and re-use of the nut;

(e) said body of plastic elastomer material projects axially beyond said bottom face of said nut body;

(f) the portion of said plastic elastomer material which projects beyond the bottom face of said nut has an outer lateral face of frusto-conical shape of decreasing diameter in an axial direction away from said bottom face of the nut body, the total included angle of said frusto-conical face being the same as the total included angle of the frusto-conical section connecting the undercut cavity and the outer nut face;



(g) and wherein the volume of the projecting plastic material is substantially equal to the volume of the space between the central axial opening through the plastic body and the inwardly adjacent outer surface of a bolt on which the nut is threaded, and characterized in that when the projecting plastic portion engages a resisting member, it will be deformed axially to a nonprojecting position flush with the bottom of the nut and will be deformed radially inwardly into such space and tightly grip the threads of the bolt and without being deformed radially outwardly between the bottom face of the nut body and the resisting member.

3,275,055
BOLT AND WASHER ASSEMBLY WITH COOPERATING PAWL AND RATCHET MEANS

Charles E. Gutshall, Roselle, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill., a corporation of Delaware

Filed Feb. 4, 1964, Ser. No. 342,486

3 Claims. (Cl. 151—37)

2. Manifold assembly comprising,

(a) a first manifold body member having a threaded aperture,

(b) a second manifold body member having an unthreaded aperture larger than and aligned with said aperture in said first manifold body member,

(c) bolt means having a shank means portion and a head means portion,

(d) said shank means portion comprising a threaded entering end and an unthreaded portion adjacent said head means,

(e) said head means comprising,

(1) a torque imparting means portion,

(2) a washer bearing surface portion, and

(3) a ratchet surface portion,

(f) said bearing surface portion being characterized as being intermediate the unthreaded shank means portion and the ratchet means portion and disposed at an angle slightly offset from a plane transverse to the axis of said bolt means and extending upwardly and outwardly away from its juncture with said unthreaded portion of said shank,

(g) washer means mounted on said unthreaded portion of said bolt means intermediate said bearing surface portion and the margin of said second manifold body means surrounding the aperture means therein, said washer means comprising,

(h) a substantially flat body means portion having a radial extent substantially coextensive with the extent of said bearing surface portion,

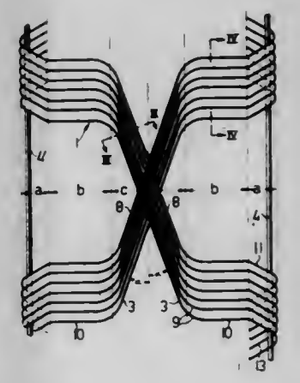
(i) first and second tooth means disposed on the outer periphery of the underside of said washer means for penetrating and providing complementary surfaces in the margin of said second manifold workpiece surrounding the aperture therein,

(j) said first tooth means comprising a row of teeth in direct line compression relationship between said bearing surface and said second manifold member workpiece and symmetrically disposed about said body means of said washer means,

(k) said second tooth means comprising a second row of teeth being radially offset from and obliquely disposed relative to said first row of teeth and at least partially in direct compression relationship to said bearing surface and said second manifold workpiece margin surrounding the aperture therein,

(l) spring-strut arm means having a first portion integrally attached to the radial margin of said body means of said washer means and having a second portion circumferentially disposed about said body means and provided with free ends cooperable with the ratchet teeth means on said head of said bolt means, the free ends being offset from the plane of said body means in a direction opposite to said first and second tooth means on said washer means, said threaded entering end of said shank means adapted to engage the threaded aperture of said first manifold body member thereby inducing tension in said bolt means, the bearing surface portion of said head means dishing said flat body means into the unthreaded aperture of said second manifold body member and embedding said first and second tooth means into the margin of said second manifold workpiece surrounding the aperture therein,

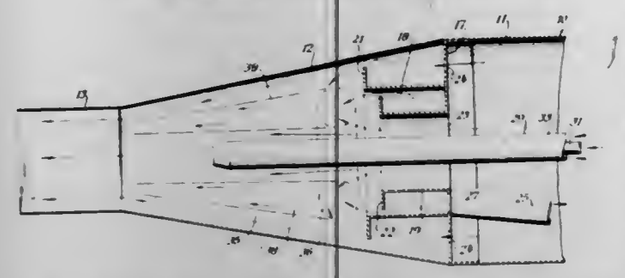
(m) the end surface of said free arms cooperating with an abutment surface on said ratchet-teeth means to provide a one-way clutch lock on initial tightening of the bolt member and providing a mechanical strut wedging action between said bolt member and said teeth of said washer means embedded in said second workpiece to prevent unauthorized retrogressive rotation thereof independent of the loss of the spring action of said spring-strut arms after annealing thereof by subjection of the entire assembly to sequential heating and cooling in the field environment.



3,275,056
PNEUMATIC VEHICLE TIRE

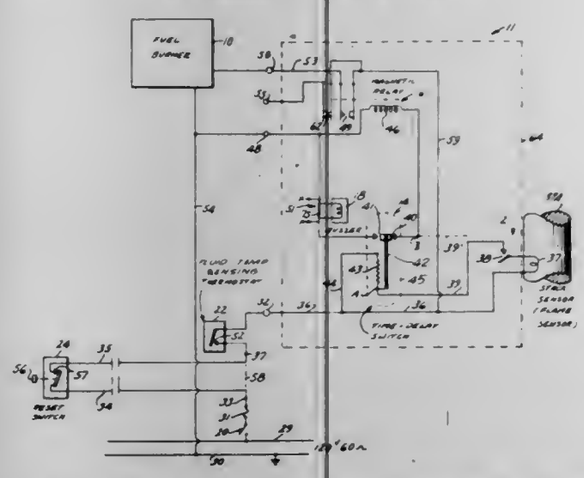
Hans Menell, Ahlem, Hannover, Germany, assignor to Continental Gummi-Werke Aktiengesellschaft, Hannover, Germany

Filed Feb. 23, 1965, Ser. No. 434,442



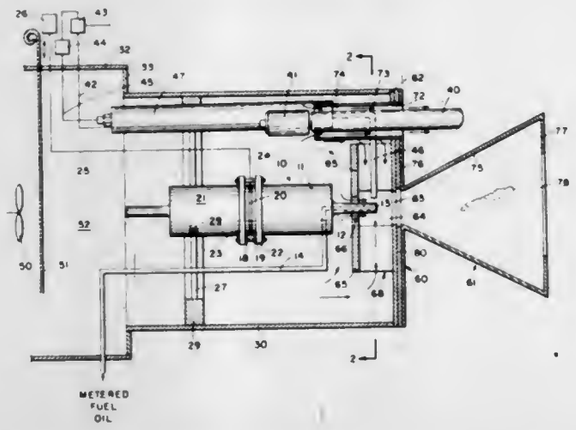
Claims priority, application Germany, Feb. 25, 1964, C 32,241

18 Claims. (Cl. 152—356)



1. A pneumatic vehicle tire having a tread strip and two oppositely located side walls and bead cores, which includes: two carcass layers, each of said carcass layers having substantially parallel thread means with a section thereof arranged below said tread strip, the thread means of said two sections crossing each other while respectively forming substantially the same angle with the circumferential direction of the tire, said angle being in the range of from 5 to 25°, the thread means of at least one of said carcass layers extending from below said tread strip in opposite directions through both of said side walls at a substantially right angle with regard to the circumferential direction of said tire and around said bead cores, those portions of said thread means which are located in said side walls being spaced from each other by a greater distance than the distance between those portions of the same thread means which are located below said tread strip.

3,275,057
TUNNEL BURNERS
Trevor Ward, Dewsbury, England, assignor to Hotwork Limited, London, England
Filed July 1, 1964, Ser. No. 379,522
5 Claims. (Cl. 158—11)



1. A tunnel burner using gaseous fuel, said burner comprising a casing forming a generally conical combustion zone tapered toward an open end of the casing, said end constituting a nozzle for discharging the products of combustion in the burner, a pair of concentrically disposed tubes mounted in said conical combustion zone parallel to the center axis thereof, said tubes defining an annular inner space between each other and an annular outer space between the outer one of said tubes and the casing wall, a first feed means for directing a flow of gaseous fuel through said inner annular space into said combustion zone, a second feed means for directing a flow of air through said outer annular space and the inner one of said tubes into said combustion zone, and flow-deflecting means at the flow discharge end of the inner one of said tubes, said deflecting means deflecting the flow of gaseous fuel toward the inner wall of the outer tube, thereby creating a turbulence in the flow of gaseous fuel entering the combustion zone.

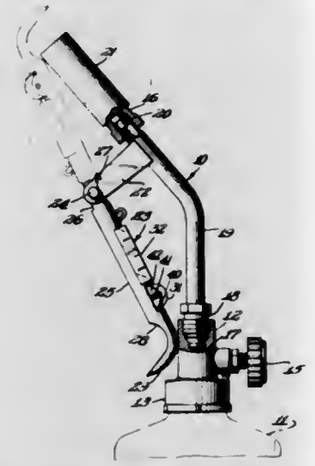
3,275,058
OIL BURNER CONTROL SYSTEMS
Jack R. Gage and Bernard Diamond, Hicksville, N.Y., assignors to D-G Controls, Inc., Hicksville, N.Y., a corporation of New York
Filed Nov. 27, 1963, Ser. No. 326,501
13 Claims. (Cl. 158—28)

1. A safety oil burner control for controlling the operation of an oil burner system and for de-energizing the burner in the event of malfunction of the system, said control comprising at least three terminals, one of these terminals being designated the burner terminal and being adapted to be connected to the oil burner, another of these terminals being designated the thermostat terminal and being adapted to be connected through a thermostat to one side of a source of electrical power, another of these terminals being designated a ground terminal and being adapted to be connected to the opposite side of the electrical source from the thermostat terminal; an electrical relay having normally open contacts and a coil for closing said contacts in response to a flow of electrical current through said coil, said relay contacts being in circuit between said thermostat terminal and said burner terminal for interrupting the supply of electrical power to said burner terminal when said relay contacts are open; a time-delay thermally-actuated switch having normally open and normally closed contacts and a resistance heating element for closing the normally open contacts and for opening the normally closed contacts after an appropriate time delay, said heating element, said normally-closed contacts of the time-delay switch and said relay coil being in a first circuit in series relationship between said thermostat terminal and said ground terminal; combustion energy responsive means being effectively shunted across said heating element for by-passing electrical current around said heating element when said combustion-energy responsive means is actuated by energy resulting from combustion; and a warning device, said heating element, said normally-open contacts of the time-delay switch and said warning device being in a second circuit in series relationship between said thermostat terminal and said ground terminal, said second circuit conducting electrical current actuating said warning device and keeping said heating element heated for maintaining said normally-open contacts in their closed position after said normally-open contacts have closed.

3,275,059
NOZZLE SYSTEM AND FUEL OIL BURNER INCORPORATING IT
John E. McCullough, Carlisle, Mass., assignor to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed May 10, 1965, Ser. No. 454,393
13 Claims. (Cl. 158—28)

1. A burner adapted to burn atomized fuel oil in the form of low-velocity particles in a continuously supplied stream of an oxygen-containing combustion fluid, comprising in combination

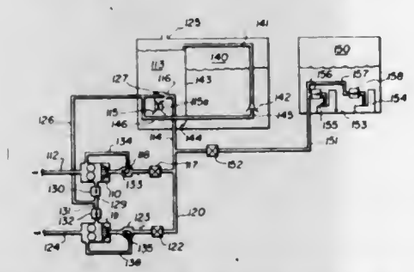
(a) delivery means for providing at an atomizing surface low-velocity fuel oil droplets which lack significant kinetic energy;



(b) means forming a central passage in which said delivery means is located;

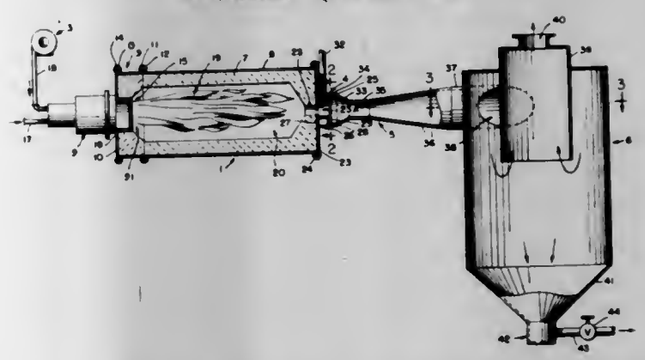
(c) means for axially directing a first portion of an oxygen-containing combustion fluid around said delivery means into said central passage;

(d) means for tangentially directing a second portion of said combustion fluid into said central passage for mixing with said first portion to form a fluid vortex around said fuel oil particles at the point of their delivery, said vortex being capable of suspending said fuel oil particles; and



(e) imperforate cone means, having an inwardly extending lipped edge at its larger discharge end, in fluid communication with said central passage and defining a portion of a combustion zone whereby the fuel oil is substantially all vaporized and partially burned prior to its discharge from said cone means.

3,275,060
COMBINED PROPANE TORCH AND IGNITER ASSEMBLY
William L. Lindgren, Sycamore, Ill., assignor to Turner Corporation, Sycamore, Ill., a corporation of Illinois
Filed Dec. 18, 1963, Ser. No. 331,402
4 Claims. (Cl. 158—33)

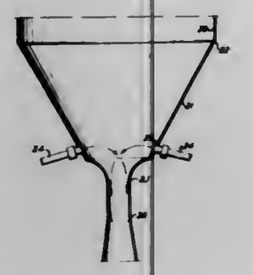


1. In a spark igniter and in combination with a torch having a burner tube having a burner assembly extending from the end thereof and having communication with a source of supply of gas, means for igniting the gas issuing from said burner assembly comprising an igniter tube movably mounted on said burner tube for movement toward and from the open end of said burner assembly and normally biased into a position remote from said burner assembly, said igniter tube having a hooded end portion extending to one side thereof over the end of said nozzle assembly and spaced therefrom and having communication with the interior of said igniter tube, and flame initiating means mounted on said igniter tube closely adjacent said hood and including a spark wheel rotatably mounted on said igniter tube adjacent said hood and extending into said igniter tube, and a flint extending along said tube and biased into engagement with said spark wheel to create a spark in the region of said hood.

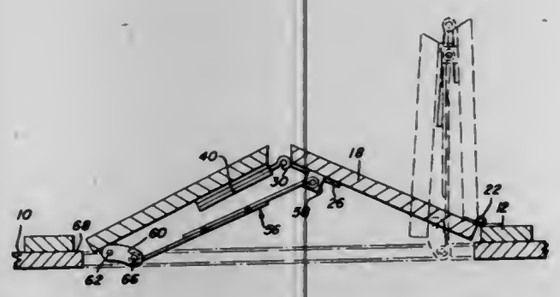
3,275,061
FUEL FEEDING SYSTEMS
Robert L. Williams, Howard E. Corner, and William B. Bell, Wichita, Kans., assignors to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Jan. 2, 1964, Ser. No. 335,261
3 Claims. (Cl. 158—36.4)

1. A fuel feeding system for an aircraft engine comprising: a fuel tank, a pump comprising a first and second stage arranged in series, first and second ejector pump means, the first of said ejector pump means being disposed in said tank and feeding through a fuel intake line to the second ejector pump means which in turn feeds into the intake of the first stage of said pump, a first pressure boost feedback line delivering from the discharge of the first stage to nozzle means of the first pump ejector means, and a second pressure boost feedback line delivering from the discharge of the second stage to nozzle means of the second ejector pump means.

3,275,062
HEATING, EVAPORATING AND CONCENTRATING APPARATUS AND PROCESSES
Arthur Williams, Munster, Ind., assignor to Submerged Combustion, Inc., Hammond, Ind., a corporation of Indiana
Filed May 22, 1964, Ser. No. 369,528
6 Claims. (Cl. 159—4)



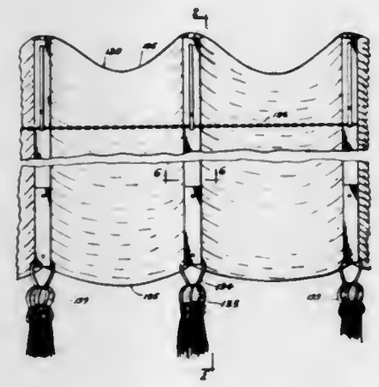
1. In a heating apparatus an elongated combustion chamber lined with a refractory material and having an inlet and an outlet at opposite ends, a burner mounted in said inlet, a tubular member outside of said combustion chamber and adjacent said outlet, a combustion gas discharge tube of substantially smaller diameter than said tubular member and positioned within said tubular member, said discharge tube being in alignment with said outlet to define a combustion gas passageway extending downstream from said combustion chamber, a transverse, upstream wall and a transverse, downstream wall defining together with said discharge tube and said tubular member an annular chamber about said discharge tube, said downstream wall having a plurality of slanted openings therein, the center lines of said openings converging obliquely, coincidentally, and axially downstream at a point downstream of said discharge tube in alignment with said passageway, means for feeding a liquid into said annular chamber, an elongated converging-diverging hollow member having a tubular wall enclosing a converging portion and having a diverging portion integral with an intermediate connecting throat portion, said converging portion having an inlet opening which is larger than the passageway in said tubular member, said converging portion enclosing but not intersecting the center lines of said slanted openings, and said diverging portion having an outlet opening, said combustion chamber, said tubular member and said converging-diverging hollow member all being secured together, with the converging portion of said converging-diverging hollow member removably secured to said tubular member.



3,275,063
APPARATUS AND METHOD FOR GAS CONTACT SPRAY DRYING
John P. Tailor, Box 597, Davenport, Iowa 52805
Continuation of application Ser. No. 347,656, Feb. 25, 1964, which is a continuation of application Ser. No. 839,109, Sept. 10, 1959. This application Dec. 14, 1965, Ser. No. 518,515
4 Claims. (Cl. 159—4)

1. In the method of drying a wet solids-containing material at an initial low temperature by contacting the same with a hot drying gas at an initial high tempera-

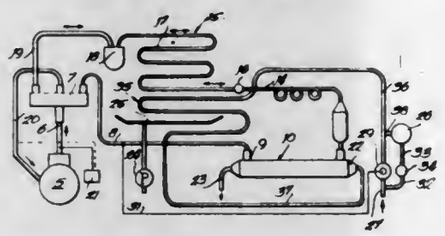
ture to produce dry solids and wet gas having final temperatures intermediate said initial high and low temperatures, the improvement which comprises forcing said hot drying gas at an initial velocity of 25 to 100 feet per second in streamline flow through a zone narrowing in cross-section in the direction of gas flow to produce an accelerating gas stream and introducing said material into said zone in particulate form in a direction transverse of the flow of said accelerating gas stream, said zone narrowing in cross section to such an extent, as correlated to the relative flow rates of said gas and material and respective initial temperatures thereof, that said gas accelerates therein to a velocity of 250 to 1000 feet per second while decreasing in volume upon cooling from its initial temperature to its final temperature, whereby particles of said material are entrained and accelerated in streamline flow by said gas stream to dry the particles.



3,275,064
FOLDING DOOR
Leslie Niels Hansen, Box 557, Hurricane, Utah
Filed Aug. 14, 1964, Ser. No. 389,591
4 Claims. (Cl. 160—206)

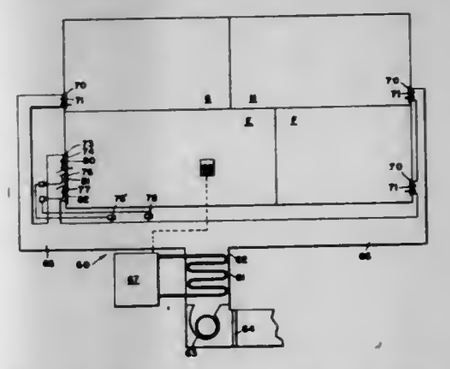
1. In combination, a door frame including first and second opposite edge portions and a third edge portion extending between corresponding ends of said first and second edge portions and defining a door opening between said first and second edge portions, a door assembly including first and second doors, said first door being pivotally secured along one edge portion to said first edge portion, means pivotally securing the corresponding edge portion of said second door to the free edge portion of said first door, means slidably securing the free edge portion of said second door to said third edge portion for movement therealong, the adjacent edge portions of said doors being spaced apart, arm means pivotally connected at its opposite ends to the free edge portion of said first door and to the remote edge portion of said second door, said door assembly when fully extended, being of slightly greater width than said opening, the first-mentioned means including first and second hinge component means pivotally secured together, said first hinge component means being fixedly secured to one of said doors and the second hinge component means being mounted on the other of said doors for reciprocal movement between two limit positions toward and away from the adjacent edge portion of said second door, means connected between said second hinge component means and the other door yieldingly urging said second hinge component means toward said one door, said second edge portion of said frame including abutment surface means disposed in a plane generally paralleling the medial plane of said opening and projecting into the latter from said second edge portion, said means slidably securing said free edge portion of said second door to said third edge portion of said frame and said arm means including means operative to force said free edge portion of said second door laterally into tight abutting engagement with said abutment surface means upon final movement of said doors to the fully closed planar positions.

3,275,065
CURTAINS
Julia R. Maras, Buhl, Minn.
(1203 Pokigama Ave. S., Grand Rapids, Minn.)
Filed Jan. 25, 1963, Ser. No. 254,554
2 Claims. (Cl. 160—330)



1. An adjustable width continuous panel draw curtain for filling a desired width portion of an opening comprising a curtain panel of a maximum width greater than the width of the portion of the opening to be covered, slides attached to the curtain at a plurality of spaced locations along the top edge of the curtain, a flexible strand element extending along the said top edge of the curtain between the two side edges of the curtain, said flexible strand being of a length corresponding to the width of the portion of the opening to be covered by said curtain, means fastening said flexible strand elment adjustably to the top edge of the curtain at spaced locations with each spaced location being adjacent each slide with the length of the portion of the flexible element between adjacent slides being such as to limit the effective width of the curtain to less than said maximum width whereby when the curtain is extended to fill the said portion of the opening the said flexible element limits the width of the extended curtain and controls the fullness of each portion of the curtain between each pair of adjacent slides by the relation of the length of the flexible element between the said pair of adjacent slides relative to the width of curtain material between the said same pair of adjacent slides, said curtain having gathers extending between said side edges and generally parallel to said top edge, an elongated stiffening tape-like structure extending transversely to said gathers and secured to said curtain from said top edge to the bottom edge and including relatively stiff strand means along each edge of the tape-like member, said tape-like member being readily bendable along a line parallel to said top edge and relatively non-bendable along a line transverse to the plane of the curtain whereby a neat appearance is maintained in said curtain.

3,275,066
STIFFENER FOR THIN SHEET MATERIAL
Ben Dolberg, 8561 W. Olympic Blvd., Los Angeles, Calif.
Filed June 8, 1964, Ser. No. 373,336
16 Claims. (Cl. 160—330)



1. A stiffener for an otherwise unsupported upper side edge portion of a drapery, comprising: a longitudinal flat stiff thin sheet stiffening member, said longitudinal flat thin sheet stiffening member being adapted to be positioned within a flat inner sheath comprised by and defined within an otherwise unsupported upper side edge portion of a drapery, said longitudinal flat thin sheet stiffening member having a substantially flat front surface and a substantially flat rear surface and being provided with a plurality of vertically longitudinally spaced similar aperture means, each aperture means including a transverse hole and an upwardly rearwardly angularly inclined effectively conical guide-way means starting at said front surface at a position below said transverse hole and extending upwardly angularly rearwardly toward said rear surface and into vertical communication with said transverse hole, whereby to be adapted to receive a substantially U-shaped rear pin portion of a drapery hook upwardly therethrough into supporting engagement with respect to said transverse hole and with an upright rear part of said rear portion of said drapery hook lying behind and immediately adjacent to and in substantially parallel relationship with respect to said rear surface of said longitudinal stiffening member so as to minimize any tendency of said rear pin portion of said drapery hook to protrude through a rear portion of said flat sheath of said drapery during the upward angular insertion of said rear pin portion of said drapery hook into said supporting engagement with respect to any one of said transverse holes of said plurality of vertically spaced aperture means.

3,275,067
REVERSIBLE HEAT PUMP SYSTEM
David H. Sniader, 1225 Spruce St., Winnetka, Ill.
Filed Nov. 5, 1963, Ser. No. 321,627
6 Claims. (Cl. 165—29)

1. A heat pump system for selectively heating and cooling a room comprising, in combination, a refrigerant compressor, a reverse cycle valve, an evaporator coil for selectively heating and cooling the air within said room and a heat exchanger connected in operative relation, said exchanger including a water medium heat exchange means, and a water heating means communicatively connecting a source of cooled water to the inlet side of the water medium heat exchange means for heating said water only during operation of said system for heating said room, and a secondary coil positioned adjacent to said evaporator coil, said secondary coil being interposed in series relation between the discharge side of said water heating means and the said inlet side of said heat exchanger whereby said secondary coil is heated by said water heating means only during operation of said system for heating said room.

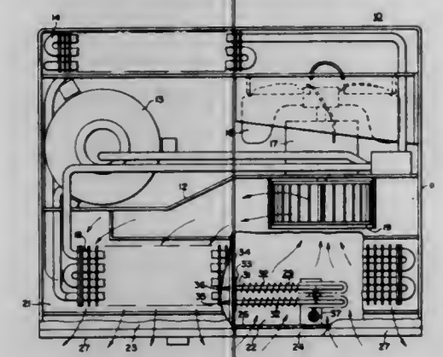
3,275,068
AIR DISTRIBUTION SYSTEM
William L. McGrath, Syracuse, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Original application Jan. 18, 1962, Ser. No. 167,106, now Patent No. 3,163,100, dated Dec. 29, 1964. Divided and this application Nov. 9, 1964, Ser. No. 409,904
2 Claims. (Cl. 165—31)

1. In an air distribution system for supplying conditioned air to a plurality of zones to be conditioned, the combination of a central station for conditioning air comprising a heat exchanger, temperature responsive control means for controlling operation of said central station, duct means communicating said central station with each zone to be conditioned, adjustable damper means for controlling the discharge of air from the duct means into the zones to be treated, mechanism responsive to the attainment of preselected pressure conditions within the duct means to vent the duct means to one of said zones thereby maintaining a predetermined minimum quantity of air flow in heat exchange relationship with the heat exchanger in the central station, said mechanism including means responsive to a first predetermined pressure condition in the duct means and a second predetermined pressure condition in the duct means to adjust said damper means, said adjustable damper means including a first damper, and a second damper, and said means including a first control to actuate the first damper in response to a first determined pressure in the duct means and a second control to actuate the second damper in response to a second predetermined pressure in the duct means.

ERRATUM

For Class 165—47 see:
Patent No. 3,275,495

3,275,069
AIR CONDITIONING APPARATUS
Anthony H. Kelly, Upper Arlington, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Feb. 7, 1964, Ser. No. 343,289
3 Claims. (Cl. 165—64)



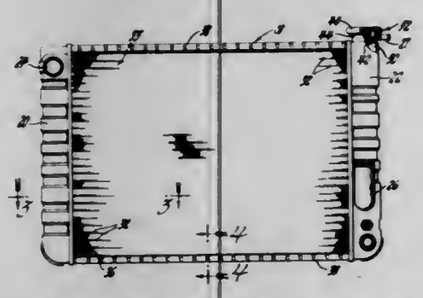
1. Room air conditioner apparatus for conditioning the air of an enclosure, comprising:
a refrigerating system,
a housing for said refrigerating system,

said housing having an inlet opening for entry of air from said enclosure into said housing and an outlet opening for discharge of conditioned air from said housing to said enclosure,

air translating means disposed in said housing for causing a stream of air to flow into said inlet opening and discharge from said outlet opening,

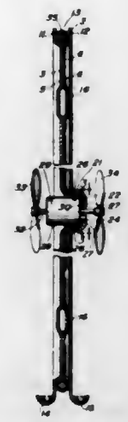
said refrigerating system having a heat exchanger disposed in the path of said air flow,

a sheathed electric resistance heating element being shaped from a single continuous tubular member



first bent back upon itself at its center and then wound in an opening-spiral from said center to the terminal ends of the two legs to form each of the said legs of said heating element into a spiral paralleling the other said leg,

said element being disposed in said inlet opening with said spiral form center generally centrally located in said opening and said terminal ends located out of said inlet opening,



said legs lying in successive planes transverse to the direction of said air flow path through said inlet opening.

3,275,070
CROSSFLOW RADIATORS
Paul K. Beatenbough, Medina, and Robert W. Bishop, Lockport, N.Y., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 9, 1963, Ser. No. 271,743
2 Claims. (Cl. 165—111)

1. A crossflow radiator comprising only two elongated tanks each having a vertical side, the said tanks being an inlet tank and an outlet tank, a core with tubes extending horizontally and connecting the vertical sides of said tanks to form flow passages leading from said inlet tank to said outlet tank, said inlet tank having a coolant inlet, said outlet tank having a coolant outlet, a pressure actuated air vent connected to atmosphere and located at the top portion of said outlet tank in free communication with tubes of said core, the horizontal cross sectional area within the said top portion of said outlet tank being clear and sufficiently large relative to the coolant flow rate through the said tubes to permit air to separate from said coolant upon the latter discharging from said tubes into said outlet tank, and the path for fluid defined by said two tanks and tubes being in only one horizontal direction.

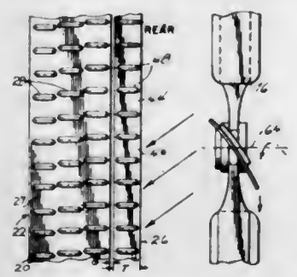
3,275,071
HEAT EXCHANGERS
Richard W. Kritzer, Chicago, Ill., assignor to Peerless of America Incorporated, Chicago, Ill., a corporation of Illinois
Filed May 8, 1964, Ser. No. 365,893
5 Claims. (Cl. 165—121)

1. A heat exchanger comprising

(a) a two-ply panel,

(b) each of said plies having an inner face and an outer face,

(c) said inner faces being disposed in juxtaposition to each other throughout the major portion of their areas,



(d) said plies defining a passageway therebetween for feeding refrigerant through said panel,

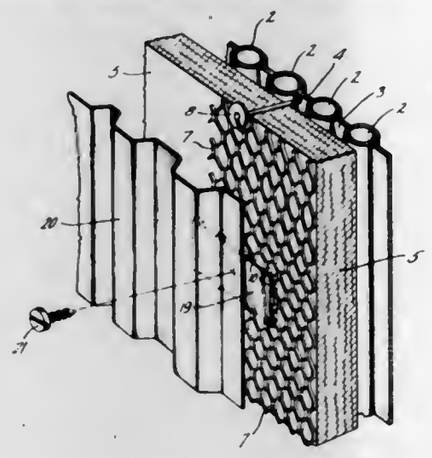
(e) a motor mounted on and carried by said panel in inwardly spaced relation to the outer periphery thereof substantially centrally of said panel, and

(f) fan blade means mounted on, and operatively connected to said motor for rotation thereby in a direction effective to feed air inwardly against, and then outwardly substantially across and in contact with the entire outer surface of at least one of said outer faces,

(g) said outer faces being substantially unobstructed outwardly of said motor.

3,275,072
RADIATOR CORE GUARD
Raymond F. Suchomel, Elmhurst, Ill., assignor to International Harvester Company, a corporation of Delaware
Filed Aug. 14, 1964, Ser. No. 389,531
9 Claims. (Cl. 165—134)

1. In a cooling system comprising radiator structure with side members and a core therebetween, said core having horizontal fins joined by rows of uniformly spaced apart vertical tubes, of which the individual tubes of each row have a slightly staggered position relative to the individual tubes of the next row, and a pusher fan on the inner side of the radiator structure, the combination with said radiator structure:

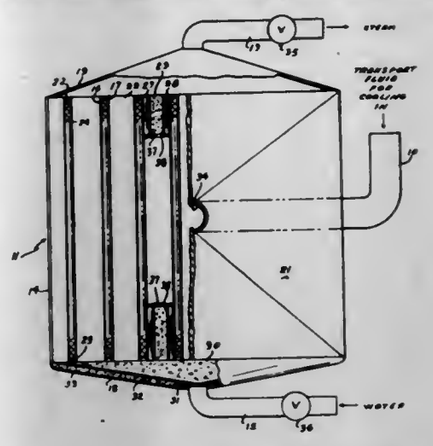


of a supported core guard for attachment to said radiator structure in a spaced-apart relation inwardly offset from the radiator core and parallel to the plane thereof;

said guard comprising a row of vertical tubes made of flat tubing and having their major cross-sectional axes parallel to the direction of air flow;

horizontally disposed, vertically spaced-apart fins holding said tubes in the row with substantially the same tube center-to-center spacing as the tubes of the inner row of tubes in the core; and

attachment brackets connected between the core guard and the side members whereby the core guard is supported in the relation described and with each tube substantially aligned in the vertical plane of a tube in said inner row of tubes in the core, so as to be interposed, and take the impact of fan-thrown particles directly upon the fins and tubes of the guard.



3,275,073
FASTENING OF ATTACHMENTS SUCH AS BOILER CASING TO EXPANDED METAL
Meyer Pincus, Hazardville, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware
Filed Dec. 28, 1964, Ser. No. 421,332
4 Claims. (Cl. 165—136)

4. An apparatus for applying boiler casing to a furnace and furnace wall tubing lining the walls thereof comprising: a blanket of insulating material securely fastened to the furnace wall tubing; said blanket having an expanded metal mesh on its outer surface; a plurality of clips, each clip having a flat metallic plate and a plurality of rigid dart-shaped projections approximately perpendicular to said plate; each dart comprising a triangular member supported at the center of its base, so that the edges of the base form shoulders, with the supporting member maintaining said base a distance from the flat plate approximately equal to the thickness of the expanded metal mesh; said clips being forced against the expanded metal mesh so that the dart-shaped projections pass therethrough and the shoulders engage thereon; an outer casing placed firmly against the expanded metal and clips; and means for securing outer casing to said clips.

3,275,074
PLATE TYPE EVAPORATIVE COOLER AND WICK THEREFOR
Robert L. Campbell and Mohamed B. Kudsi, Dayton, Ohio, assignors to United Aircraft Products Inc., Dayton, Ohio, a corporation of Ohio
Filed Sept. 10, 1963, Ser. No. 307,837
11 Claims. (Cl. 165—166)

1. Evaporative cooling means in a plate-type heat exchanger, including at least two spaced apart pairs of heat conductive plates, each pair defining a flow path for a heated fluid, a layer of liquid holding material intermediately disposed between said pairs of plates and spaced therefrom, and multiple purpose strip fin devices on opposite sides of said layer of material in mutually contacting heat transmitting relation between said pairs of plates and said liquid holding material, said devices

positioning said material and being made of heat conductive material with an undulating crimped configuration providing escape paths for vapor released from said material.

3,275,075
VISCOSITY CONTROL IN PETROLEUM RECOVERY
William B. Gogarty, Littleton, and Russell W. Olson, Denver, Colo., assignors to Marathon Oil Company, Findlay, Ohio, a corporation of Ohio
No Drawing. Filed Apr. 27, 1965, Ser. No. 451,304
6 Claims. (Cl. 166—9)

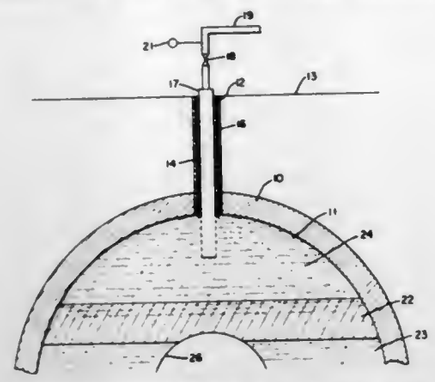
1. The process comprising adding to a soluble oil a predetermined amount of aqueous diluent sufficient to form a microemulsion of predetermined viscosity, injecting said microemulsion into a subterranean oil-bearing formation through at least one injection well drilled into said formation, displacing said microemulsion and crude petroleum in said formation toward at least one production well drilled into said formation, and recovering crude petroleum through said production well.

3,275,076
RECOVERY OF ASPHALTIC-TYPE PETROLEUM FROM A SUBTERRANEAN RESERVOIR
Lorld G. Sharp, Irving, Tex., assignor to Mobil Oil Corporation, a corporation of New York
No Drawing. Filed Jan. 13, 1964, Ser. No. 337,134
12 Claims. (Cl. 166—11)

1. A method for the recovery of asphaltic type petroleum from a subterranean reservoir wherein a fluid capable of miscibly displacing said petroleum is injected into said reservoir through a first well and moved through said reservoir to a second well and injection of said fluid effects precipitation of asphaltic constituents from said petroleum and thereby reduces the permeability of said reservoir from the standpoint of obtaining a desired rate of flow into said reservoir of said fluid and said fluid bypasses through highly permeable zones in said reservoir, comprising the steps of:

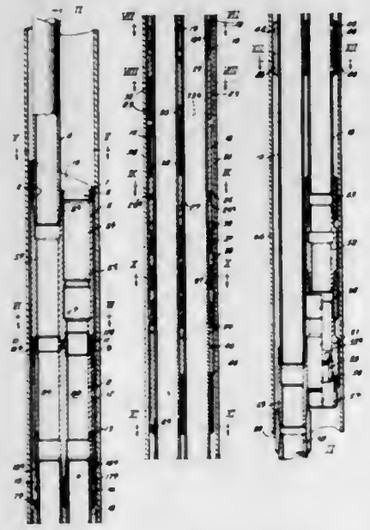
(a) effecting combustion of said petroleum in said reservoir in the presence of an oxidizing fluid adjacent to a first well penetrating said reservoir to remove said petroleum from said reservoir from a distance from said first well such that reduction in permeability of said reservoir by precipitation of asphaltic constituents will not be of significance from the standpoint of obtaining a desired rate of flow of said fluid and highly permeable zones within said reservoir beyond said distance from said first well will be saturated to a large extent with gas whereby permeability of said zones to said fluid is reduced,

(b) discontinuing said combustion of said petroleum,
(c) thereafter injecting into said reservoir through said first well said fluid capable of miscibly displacing said petroleum from said reservoir and displacing said petroleum within said reservoir toward said second well whereby precipitation of asphaltic constituents from said petroleum by said fluid will not occur within said reservoir at a distance from said first well that reduction in permeability of said reservoir by said precipitation will be of significance from the standpoint of obtaining a desired rate of flow of said fluid and the movement of liquid in said zones having reduced permeability as a result of said gas saturation tends to be blocked whereby bypassing of said fluid is minimized, and
(d) recovering said petroleum from said reservoir through said second well.



3,275,077
RECOMPLETION OF WELLS
Floyd A. Smith, Tulsa, Okla., and Joseph W. Graybeal, Midland, and Mercer H. Parks, Houston, Tex., assignors, by mesne assignments, to Esso Production Research Company, Houston, Tex., a corporation of Delaware
Filed Mar. 2, 1964, Ser. No. 348,438
7 Claims. (Cl. 166—25)

1. The method of plugging selected perforations in a cased and perforated well bore, comprising:
packing particulated sulfur into all of the perforations;
heating the particulated sulfur in said selected perforations until the particulated sulfur therein is fused together to form a plug that adheres to the walls of the perforations; and
producing the well to remove the unfused sulfur particles from the perforations other than said selected perforations.

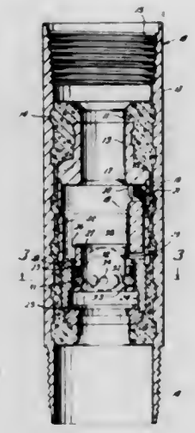


3,275,078
METHOD FOR DISPLACEMENT OF FLUIDS IN UNDERGROUND STORAGE OF GASES
Frank Rieber, Jr., Littleton, Colo., assignor to Interstate Service Corporation, doing business as Ball Associates Ltd., Denver, Colo., a corporation of Maryland
Filed July 29, 1963, Ser. No. 298,355
3 Claims. (Cl. 166—42)

1. A method for underground storage of fluids which comprises the steps of: introducing into a confining geological formation, containing an absorbed underground fluid, a displacing liquid which is at least partially miscible, both with the fluid to be stored and the absorbed underground fluid; introducing the liquid to be stored into the confining geological formation; forming a layer of the displacing liquid between the zone of absorbed underground fluid and the zone of storage fluid; applying pressure to the zone of storage fluid to push the layer of displacing liquid downwardly for displacing the underground fluid from the formation and expanding the storage space above the layer of displacing liquid; and introducing the

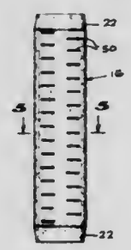
storage fluid into the storage space thus formed for storage therein.

3,275,079
DUAL STRING HYDRAULIC PACKER
Morgan L. Crow, Dallas, Tex., assignor to Dresser Industries, Inc., Dallas, Tex., a corporation of Delaware
Filed Jan. 23, 1963, Ser. No. 253,429
16 Claims. (Cl. 166—122)



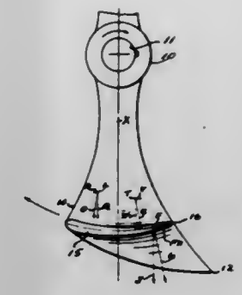
5. In a well packer, a tubular body having a pair of longitudinal passages therethrough; a pair of tubular mandrels attached in, and extending below, the passages; at least one packer sleeve surrounding the mandrels; a support secured to one of the mandrels below the packer sleeve; slips secured to the support below the sleeve; expander means surrounding the mandrels below the sleeve arranged to move the slips outwardly; hydraulically actuated telescoping members, one of which is stationary and the other of which is movable downwardly against the upper end of the packer sleeve to compress same; means to apply hydraulic pressure from one of the passages between the telescoping members; hydraulically actuated slip pistons mounted in the wall of the body and movable outwardly thereof; and means to apply hydraulic pressure from one of the passages to the inner ends of the hydraulically actuated slip pistons.

3,275,080
VALVE RELEASE MECHANISM FOR A WELL DEVICE
Wayne F. Nelson and Gil R. Boyd, Waxahachie, Tex., assignors to Koehring Company, Waxahachie, Tex., a corporation of Wisconsin
Filed May 15, 1964, Ser. No. 367,659
4 Claims. (Cl. 166—225)



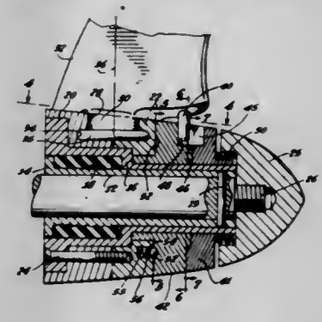
1. A well device adapted for installation in a well string comprising,

a body having a flow-way therethrough and adapted to be made up in a well string,
an annular valve seat in said body surrounding said flow-way,
a flapper valve adapted to engage said annular valve seat, seating of said flapper valve on said seat closing flow upwardly through said flow-way,
an annular element within said body normally holding said flapper valve out of engagement with said seat,
means releasably securing said annular element to said body in a position holding said flapper valve out of engagement with said seat, and



a plurality of support elements movably mounted in said annular element and extending into the bore of said annular element,
said support elements adapted to support a closure element within the bore of said annular element, allowing pressure above said annular element to release said securing means and move said annular element to a position out of engagement with said flapper valve,
movement of said annular element allowing said support elements to move out of supporting relation to said closure element, whereby said closure element is discharged from said bore of said annular element.

3,275,081
METHOD OF LINING WATER WELLS AND NON-CORROSIVE LINER THEREFOR
John R. Beylik, 11118 Luitwieler Ave., Whittier, Calif.
Filed Nov. 26, 1963, Ser. No. 326,035
1 Claim. (Cl. 166—228)

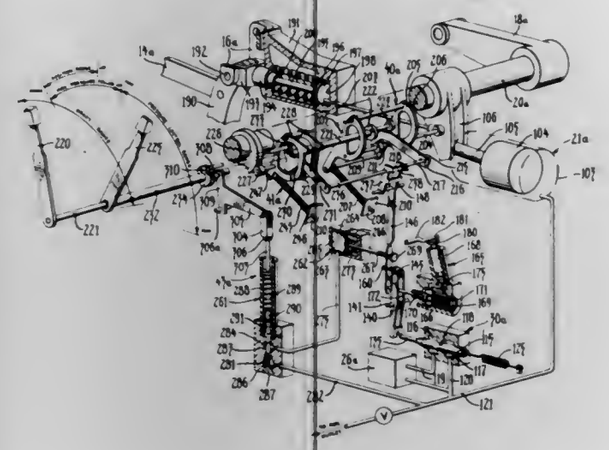


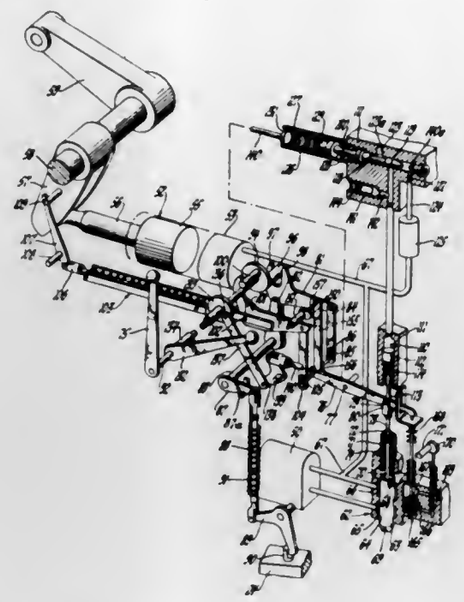
A unitary non-corrosive liner section for water wells comprising a cylindrical body of asbestos-cement having a plurality of perforations, each perforation being in the form of an elongated slot extending transversely of the body and defined by a pair of parallel side walls extending in planes normal to the longitudinal axis of the body and by a pair of outwardly diverging end walls, said perforations being disposed in rows extending longitudinally of the body.

3,275,082
PROPELLERS FOR WATER CRAFT
Robert E. Stark, 176 Crestwood Drive, Avon Lake, Ohio
Filed Aug. 19, 1965, Ser. No. 481,000
9 Claims. (Cl. 170—160.5)

1. A propeller of the class described comprising a hub, at least one propeller blade extending from the hub and formed integrally therewith, said blade being of a material having limited flexibility and being resilient, a fin attached to the low pressure side of the blade and arranged to cause an increase in the pitch of the blade with an increase in r.p.m.

3,275,083
VARIABLE PITCH PROPELLER
Norman J. Allin, Hermosa Beach, Calif., assignor to Bradley A. Kendis, trustee
Filed Oct. 15, 1965, Ser. No. 496,549
6 Claims. (Cl. 170—160.13)





1. In a variable pitch propeller driven by applied power to act on ambient fluid, the combination of:
a rotary hub structure adapted to be driven by the applied power;
a plurality of blades rotatably mounted on the hub structure for adjustment in pitch,
each of said blades having a finger spaced radially from its axis of pitch adjustment,
a portion of the rotary hub structure being rotatable relative to the rest of the hub structure and being responsive to the fingers of the blades to change to two different states alternately in response to successive oscillations of the blades about their pitch axes,
said portion of the hub structure at its two states confining the fingers of the blades at two different pitch adjustments of the blades,
whereby the pitch of the blades may be changed from one of the alternate pitch adjustments to the other by interrupting the applied power and then again applying the power to cause thhe ambient fluid to create successive opposite moments on the propellers to oscillate the propellers thereby to change the state of said portion of the hub structure.

3,275,084
TRACTOR HYDRAULIC CONTROL SYSTEM

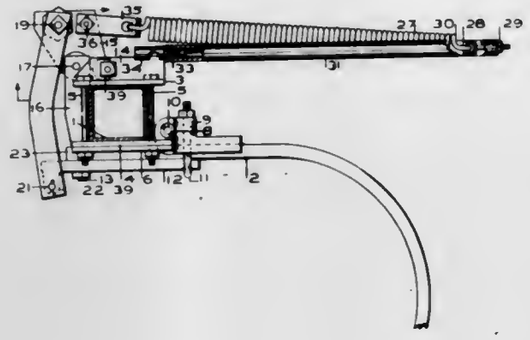
Ernest V. Bunting, Detroit, Mich., assignor to Massey-Ferguson Inc., Detroit, Mich., a corporation of Maryland

Filed Jan. 31, 1964, Ser. No. 341,548
10 Claims. (Cl. 172—9)

1. In a tractor having a hitch linkage and hydraulic actuator for lifting said linkage upon admission of fluid under pressure to said actuator, a control system comprising, in combination, a source of fluid under pressure including a control valve arranged to direct fluid to and from said actuator, a draft control linkage coupling said hitch linkage and said valve for discharging fluid from said actuator upon a decrease from a predetermined draft load on said hitch linkage, a position control linkage coupling said hitch linkage and said valve for stopping the addition of fluid to said actuator when the hitch linkage reaches a predetermined height, and a pressure control linkage including means for sensing the fluid pressure in said actuator connected to said valve for stopping the addition of fluid to said actuator when a predetermined pressure is exceeded, said draft control linkage, position control linkage and pressure control linkage each being effective to take over and override the others for stopping the addition of fluid to said actuator when a corresponding one of said predetermined load, height or pressure conditions is reached.

3,275,085
POWER OPERATING AND CONTROL SYSTEM FOR TRACTORS

Ernest V. Bunting, Detroit, and Edwin J. Skiba, Warren, Mich., assignors to Massey-Ferguson Inc., Detroit, Mich., a corporation of Maryland



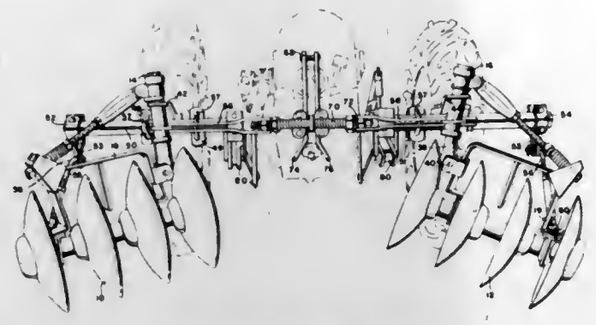
Filed Aug. 1, 1962, Ser. No. 214,123
24 Claims. (Cl. 172—10)

1. In a hydraulic system for a tractor, including a pressure fluid main actuator for raising and lowering an implement coupled to the tractor, the combination of a pump having a fluid supply connection to the main actuator, valve mechanism including flow control means shiftable from a neutral position in which fluid is locked in the main actuator into alternatively available supply and exhaust positions in which pressure fluid is respectively delivered to the main actuator and drained from the main actuator, means biasing said flow control means toward one of said latter two positions, a second pressure fluid operated actuator operable to shift said flow control means against its bias, pressure responsive means connecting said main actuator and said second actuator for draining said second actuator when the pressure in the main actuator falls below a predetermined value and opening said main actuator to said second actuator when the pressure in the main actuator exceeds the predetermined value and means for adjusting said pressure responsive means to respond to selected different pressures.

3,275,086
SPRING RELEASE LOCKING ATTACHMENT FOR CULTIVATOR SHANKS

George Henry Morris, 37 6th Ave. N., Yorkton, Saskatchewan, Canada

Filed Feb. 26, 1964, Ser. No. 347,431
7 Claims. (Cl. 172—266)

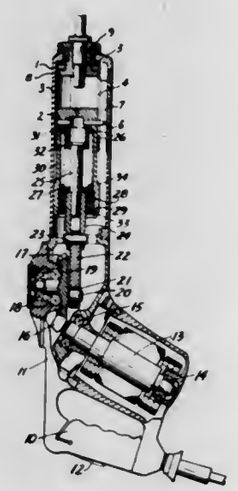


1. In a spring release mounting for a cultivator shank, the cultivator including a cross frame bar to which the shank is attached, a bracket on the cross frame bar, means rearwardly pivotally attaching the shank to the bracket with the shank suspended below and projecting forwardly of the bracket, a rocker plate pivotally mounted on the cross frame bar bracket vertically disposed and projecting upwardly and forwardly of the bracket, links pivotally attaching to the upper forward portion of the rocker plate, means pivotally attaching the links to the shank forwardly of the frame bar bracket, a spring mounting bracket on the cross frame bar bracket projecting rearwardly, and an expansion spring rearwardly anchored to the rearwardly projecting bracket and forwardly connected to the rocker plate, and by which upward movement of the shank rear portion by the link connection of its forward portion with the rocker plate pivots the rocker plate forward and the movement of the shank is thereby opposed by said spring.

3,275,087
ADJUSTABLE DISC HARROW

William H. Petitt, Chattanooga, Tenn., assignor to The Harriman Manufacturing Company, Chattanooga, Tenn., a corporation of Tennessee

Filed Feb. 3, 1965, Ser. No. 431,492
9 Claims. (Cl. 172—572)

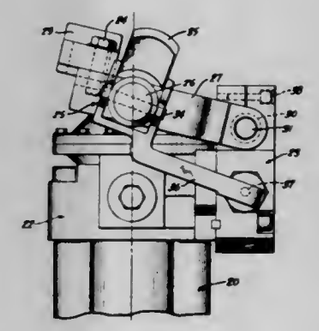


7. An adjustable disc harrow, comprising:
(A) a tool bar;
(B) first and second tie rod brackets mounted on said tool bar;
(C) linkage bracket means mounted on said tool bar;
(D) first and second disc gang assembly means mounted on said tool bar, said gang assembly means including first and second kingpins set at predetermined angles from vertical; and
(E) first and second tie rods having first ends attached to said first and second disc gang assembly means, respectively, and second ends for selectively attaching to said first and second tie rod brackets and said linkage bracket means respectively.

3,275,088
REVERSING MEANS FOR PERCUSSION HAMMERS

Wilhelm Schröttle, Munich, Germany, assignor to Hermann Wacker and Peter Wacker, both of Munich, Germany

Filed Mar. 16, 1964, Ser. No. 351,977
Claims priority, application Germany, Mar. 15, 1963, W 34,108
2 Claims. (Cl. 173—110)

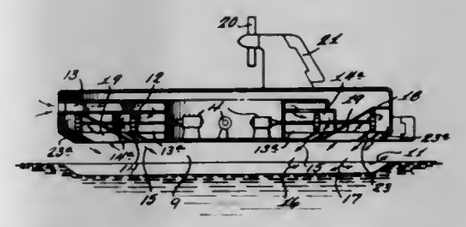


1. A power driven percussion hammer and drill of the type provided with a tool turning means and comprising a housing, said tool turning means comprising a reciprocating sleeve arranged in the lower end of said housing, a first toothed disk provided on the lower end of said sleeve, a tool guiding socket disposed in the lower end of said housing, a second toothed disk provided on said socket and disposed opposite said first toothed disk and means for raising said first toothed disk to engage and turn with said second toothed disk, said means comprising a percussion piston having a driver pin and said sleeve being in force transmitting relation with said piston and having a rifle slot receiving said driver pin for reciprocating movement therein for turning said sleeve and said first toothed disk.

3,275,089
HANDLE MEANS FOR PERCUSSIVE TOOL

Willard D. Kaiser, Grove City, and James C. Swain and George E. Manning, Columbus, Ohio, assignors, by mesne assignments, to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed Nov. 5, 1963, Ser. No. 321,610
7 Claims. (Cl. 173—162)

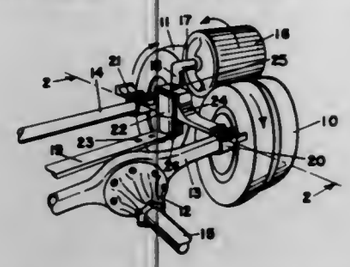


1. In a fluid pressure actuated percussive tool having a vibratory tool body, a handle frame, means resiliently securing said handle frame to said vibratory tool body laterally offset from the central axis of said tool to isolate said handle frame from the percussive action of said vibratory tool body, gripping means on said handle frame located in a plane substantially coinciding with the central axis of the tool, and a counterweight on said handle frame located adjacent to said gripping means remote from said resilient securing means.

3,275,090
METHOD AND APPARATUS FOR INCREASING THE EFFECTIVENESS OF AIR CUSHION VEHICLES

Carl Weiland, Seefeldstrasse 124, Zurich, Switzerland

Filed Oct. 16, 1958, Ser. No. 767,575
Claims priority, application Switzerland, Oct. 22, 1957, 51,837
18 Claims. (Cl. 180—7)

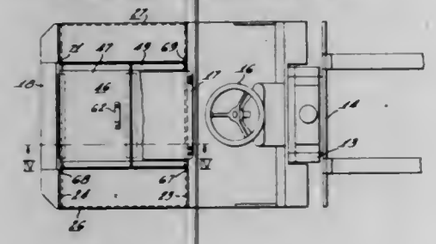


13. The method of supporting a body, having a substantially airtight undersurface, above and in close proximity to a pressure-retaining lower surface, the steps comprising: emitting air under pressure from and beneath the body to develop between the undersurface and a lower surface a cushion of air under superatmospheric pressure sufficient to lift the body to a stable elevation above the lower surface; and retarding the flow of air outwardly from between the surfaces along at least a portion of the periphery of the undersurface by emitting from the body a downwardly-directed jet-like curtain of air extending along the peripheral portion of the undersurface, and spaced outwardly of the location where the air was emitted to develop the cushion.

3,275,091
TRACTION DEVICE FOR VEHICLES

Joseph B. Steck, R.D. 1, Hadley, Pa., and Donald H. Slater, R.D. 1, Fredonia, Pa.

Filed Aug. 20, 1964, Ser. No. 390,848
2 Claims. (Cl. 180—22)

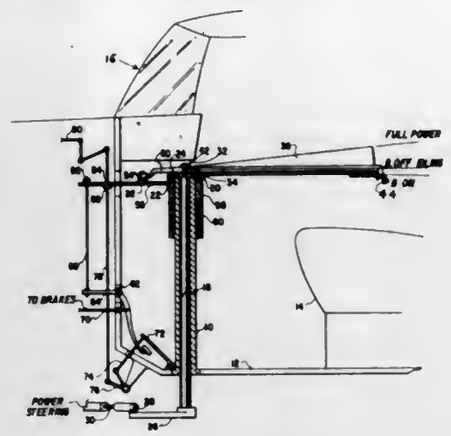


1. A drive for a vehicle having ground engaging rear drive wheels and ground engaging idler load supporting wheels,
- spaced parallel load supporting transversely extending rear axles on said truck comprising a drive axle and an idler axle,
- said drive wheels being disposed on said drive axle and said idler wheels being disposed on said idler axle,
- two horizontal bars each supported at one side of said truck,
- one end of each said bar being supported on said idler axle and the other end of each said bar being supported on said drive axle,
- a fluid actuated member attached to an intermediate part of each said bar,
- a bracket supported on each said fluid actuated member,
- a link on each said bracket rotatably receiving a traction idler,
- said bracket being urged downwardly by said fluid actuated member when said fluid actuated member is actuated, moving said traction idler into driving engagement with said idler wheels and said drive wheels.

3,275,092
ELECTRIC TRUCK BATTERY COMPARTMENT

Dean A. Matthews, Chicago Heights, Ill., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.

Filed May 5, 1964, Ser. No. 364,911
19 Claims. (Cl. 180—68.5)

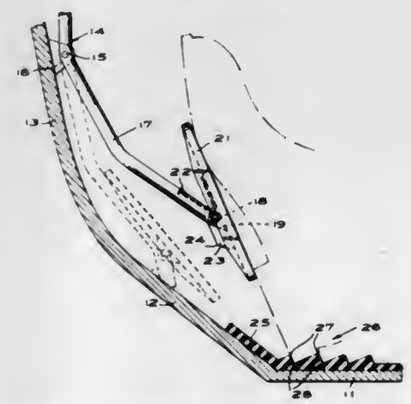


1. An electric lift truck comprising:
- a truck frame including a portion adapted to support a battery,
- side panels releasably connected to said frame at opposite lateral sides of said portion,
- a top panel releasably interlocked with said side panels and
- a driver's seat connected to said frame, said seat being shiftable between an occupant receiving position overlying said top panel in which a substantial portion of the weight of the operator is transferred through the seat to said top panel to maintain the latter in interlocking engagement with said side panels and a shifted position wherein said seat does not overlie said top panel and the latter may be removed from its interlocking engagement with said side panels.

3,275,093
HAND COMBINED VEHICLE STEERING, POWER, AND BRAKING CONTROL HANDLE

Walter S. Pawl, 2844 Powder Mill Road, Adelphi, Md.

Filed Sept. 4, 1964, Ser. No. 394,577
12 Claims. (Cl. 180—77)

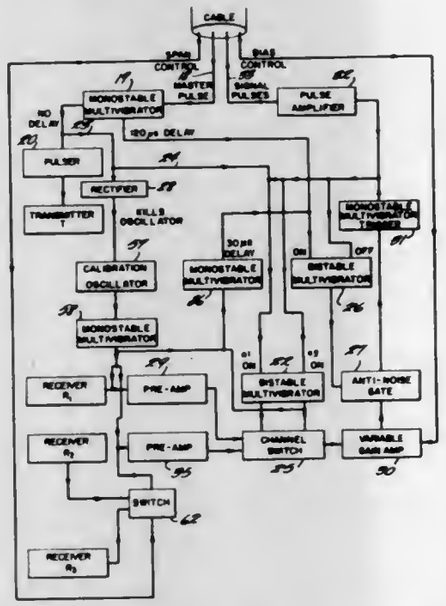


1. A unitary hand control system for automotive vehicles which have a power control linkage, a brake control linkage, a steering control linkage, and a front seat compartment for the driver, comprising:
- a steering post in said compartment near said front seat,
- a steering shaft rotatably mounted in said post, having a steering control lever extending rearwardly from its top to a point convenient for the driver,
- said control lever being pivoted on said steering shaft to swing vertically and having an arm extending forwardly from its pivot, and a lost motion connection between the end of said arm and the power and brake control linkages to affect their controls in adjacent ranges of the swing of said control lever, the full power and brakes-on positions being at opposite ends of said ranges.

3,275,094
MOTOR VEHICLE PEDAL SUPPORT

Everett P. Kennedy, Detroit, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed July 22, 1964, Ser. No. 384,383
4 Claims. (Cl. 180—90.6)

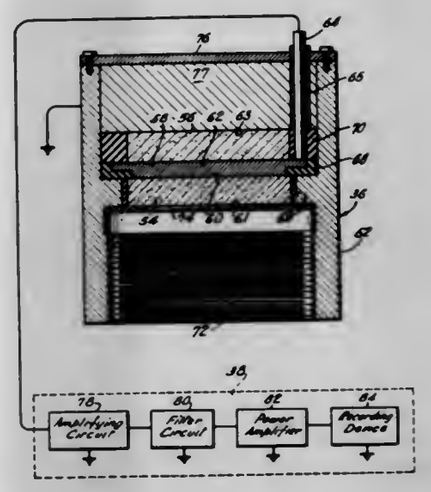


1. A motor vehicle comprising a passenger compartment defined in part by a horizontally extending floor pan and an adjacent vertically extending dash panel, a lever supported for pivotal movement about a pivot axis spaced a substantial vertical distance above said floor pan, said lever being rotatable from a normal position to a depressed position, said lever having a portion thereof extending downwardly from said pivot axis toward said floor pan and inwardly of said passenger compartment from said dash panel, an elongated pedal, means supporting said pedal upon said lever portion intermediate the upper and lower ends of said pedal for pivotal movement of said pedal relative to said lever portion to conform to the most comfortable foot position of the vehicle operator, biasing means interposed between said lever portion and said pedal for urging said pedal in the same pivotal direction as the movement of said lever from its normal to its depressed position, stop means for limiting the pivotal movement in said direction of said pedal relative to said lever portion under the influence of said biasing means, said biasing means being yieldable under the influence of forces exerted upon said pedal by the foot of the vehicle operator, motion transmitting means interconnecting said lever with a pedal-operated component of said vehicle, a pad extending across at least a portion of said floor pan, and a heel rest formed by said pad adjacent to and below said pedal, said heel rest comprising a plurality of serrations having raised portions terminating adjacent depressed bights, said bights being longitudinally spaced at varying distances from said dash panel to establish alternate fulcrum positions for the heel of the vehicle operator.

3,275,095
ACOUSTIC WELL LOGGING APPARATUS

Robert B. Blizard, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas

Filed Sept. 21, 1959, Ser. No. 841,401
8 Claims. (Cl. 181—.5)



1. Well logging apparatus for determining the travel time of acoustic wave energy through the earth formations traversed by a bore comprising a logging tool adapted to travel through the bore, said tool including longitudinally spaced acoustic means for periodically generating and receiving acoustic wave energy, means in said tool responsive to acoustic wave energy for deriving pairs of electrical signals in which signals of each pair are spaced a time duration apart representative of the time required for acoustic wave energy to travel through the earth formations between at least two of said acoustic means at a predetermined spacing, integrating means coupled to said signal deriving means for obtaining indications of the total travel time of acoustic wave energy along intervals of the bore, said integrating means including means for periodically generating pulses in a predetermined manner and means for counting said pulses, said integrating means being responsive to said pairs of electrical signals in such a manner that said counting means counts said pulses during the time duration between the signals of each of said pairs, means coupled to said acoustic means for changing said predetermined spacing, and means coupled to said counter means for varying the counting rate of said counter means as said predetermined spacing is changed.

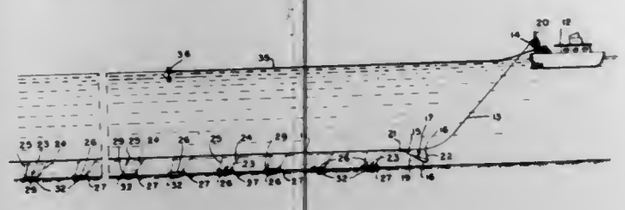
3,275,096
TWO CRYSTAL MICROPHONE ASSEMBLY FOR WELL SOUNDING

Arthur H. Lord, Bellaire, Tex., assignor to Texaco Inc., New York, N.Y., a corporation of Delaware

Filed Apr. 10, 1963, Ser. No. 272,508
4 Claims. (Cl. 181—.5)

1. A microphone assembly comprising a housing having a chamber at one end thereof, first and second piezoelectric crystal transducers, said first crystal transducer being disposed to receive acoustic energy passing through said chamber, a compression plate interposed between said first and second transducers so as to act as a buffer and as an electrical interconnection between said first and second crystal transducers, an output terminal electrically connected to said compression plate, means for insulating said terminal from said housing, the faces of each of said crystal transducers contacting said compression plate having opposite polarities, annular support means for insulating said compression plate from said housing, and a diaphragm disposed between said first transducer and said chamber so as to cover said first transducer and to electrically connect the other face of said first transducer to said housing, said second transducer being mounted within said housing so as to provide electrical contact between the other face of said second transducer and said housing.

3,275,097
MARINE SEISMIC CABLE SYSTEM

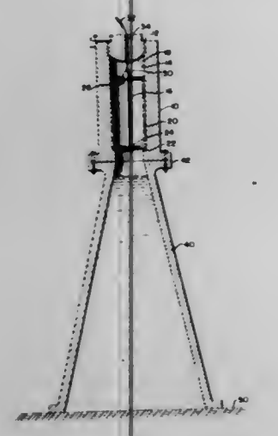


George M. Pavey, Jr., Dallas, Tex., assignor to Sonic Engineering Company, Dallas, Tex.

Filed June 17, 1964, Ser. No. 375,718
12 Claims. (Cl. 181—.5)

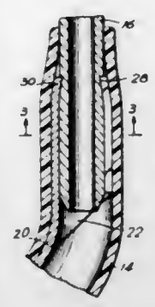
1. In a waterborne system for seismic prospecting for geological structures disposed beneath a body of water, in combination,
- (1) a positively buoyant elongated flexible streamer having a plurality of detecting devices disposed at intervals therein,
- (2) a flexible lead-in cable connected to the head end of the streamer for effecting a towing connection to a moving vessel,
- (3) means on the vessel for applying a towing force to said connection while the vessel is moving along a course and for removing said towing force at will,

(4) a depressor connected to said cable at the head end of the streamer for maintaining the head end of the streamer near the bottom of the body of water while the streamer is being towed, said depressor having sufficient mass to sink and anchor the head end of the streamer as the towing force is removed therefrom, and



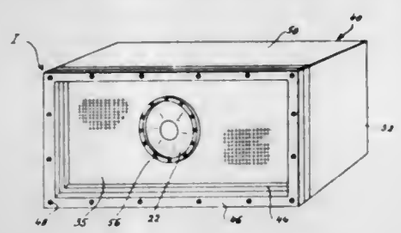
(5) a plurality of negatively buoyant vehicles connected at the fore and aft portions thereof respectively to

the streamer at regular intervals, each of said vehicles being sufficiently heavy when submerged to engage said bottom continuously as the vehicle moves therealong and having



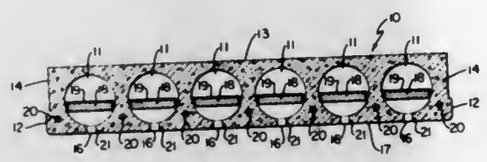
(6) means depending downwardly therefrom for furrowing the bottom thereby to increase the resistance of the streamer to lateral drift sufficiently to cause the streamer throughout the length thereof to be forcibly restrained from departure from the line defining the course of the vessel.

3,275,098
METHOD AND APPARATUS FOR GENERATING SEISMIC WAVES
William S. Filler, 302 Bradley Ave., Rockville, Md.
Filed Dec. 27, 1960, Ser. No. 78,701
7 Claims. (Cl. 181—.5)



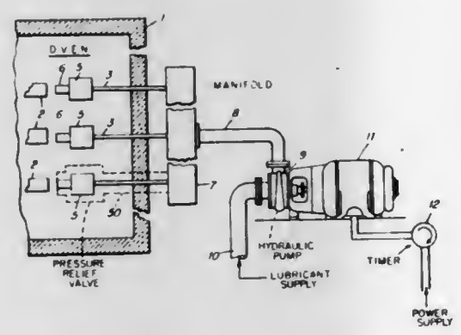
1. A method for transmitting a directed concentrated shock wave to the ground which comprises, detonating a substantial quantity of high explosive in an energy release region, said region being confined in all directions save one exit area, said energy release region being several times the volume of the high explosive generating thereby a supersonic shock wave, passing the shock wave along a generally tubular path commencing at the exit area of said energy release region, and transmitting the shock wave to the ground from the terminus of said tubular path, the tubular path having previously been positioned relative to the ground so that the shock wave issuing therefrom is transmitted to the ground, and wherein the energy is released by detonation of a high explosive charge suspended in spaced apart relation to the confining bounds of said energy release region.

3,275,099
STETHOSCOPE EAR TUBE MOUNTING
Irving A. Speelman, Roslyn Heights, N.Y., assignor to Propper Manufacturing Company, Inc., Long Island City, N.Y., a corporation of New York
Filed Oct. 22, 1965, Ser. No. 501,490
2 Claims. (Cl. 181—24)



1. A stethoscope comprising an elongated flexible tube having at one end a pair of branching tube portions, a pair of rigid elongated ear tubes having lower ends received in said branching portions in fluid communication therewith, and a U-shaped elongated leaf spring extending in said branching portions and having end portions interconnecting said ear tubes at said lower ends for biasing the ear tubes towards each other, said ear tube ends and said spring end portions having interengaged complementary fittings, one of said complementary fittings having external groove means with the other complementary fitting having a portion interengaged with said groove means to provide for the independent swiveling of said ear tubes about the axes thereof for adjusting the ear tubes to the user while positively restraining the disengagement thereof from said spring and branching portions.

3,275,100
LOUDSPEAKER ASSEMBLY HAVING LOUDSPEAKER WHOLLY SUPPORTED BY VIBRATORY DIAPHRAGM
William S. Dunning, Kampfe Lake, Bloomingdale, N.J.
Filed June 16, 1965, Ser. No. 464,451
4 Claims. (Cl. 181—31)

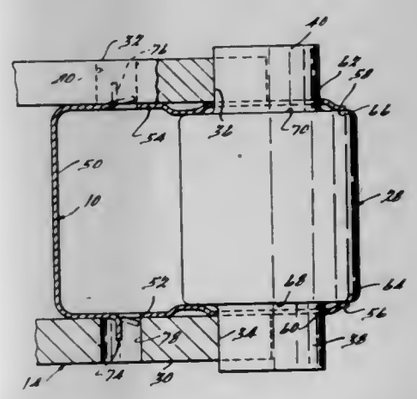


1. A loudspeaker assembly comprising a magnetic loudspeaker having a rigid conical apertured frame with an annular flange at its wider end, a magnet secured to the apical end of the frame, a conical vibratory cone nested in the frame, electrically energized driving means carried by the magnet and operatively connected to the apical end of the cone to drive the same axially, said cone having a peripheral rim registering with and abutted to said flange, a membranous diaphragm having an opening therein, means securing both the flange of the frame and the rim of the cone to the edge of said opening in sealing relationship, so that the entire magnetic loudspeaker is supported only by the diaphragm and is free from all other external support, a resilient, narrow gasket extending all around the periphery of the diaphragm and secured thereto at one edge of the gasket, an enclosure having an opening therein, and means securing the other edge of said gasket in hermetic sealing relationship all around the opening in the enclosure so that the diaphragm is supported in flat, stretched vibratile condition with the loudspeaker carried only by the diaphragm, the diaphragm having a free vibratory area at least as large as that of the cone.

3,275,101
ACOUSTIC STRUCTURAL UNIT
Thomas G. Morrissey, Denver, and George Bradley Davis, Jr., and Harold H. Short, Boulder, Colo., assignors, by direct and mesne assignments, of forty percent to James G. Milne, Jr., Lucerne, Colo., forty percent to Harold H. Short, and twenty percent to George Bradley Davis, Jr.
Filed Dec. 16, 1963, Ser. No. 330,803
9 Claims. (Cl. 181—33)

1. An acoustic load bearing structural unit which comprises an elongated flexural slab of reinforced concrete having a plurality of elongate cavities formed therein in transversely spaced substantially parallel relationship with respect to each other, each of the cavities having elongate aperture means formed through a wall of the cavity forming a perforated surface and establishing communication between the inside of the cavity and the atmosphere, the ratio of the total surface area of the apertures to the total area of the perforated surface being in the range from about 7 to about 15 percent, fibrous sound absorbing material in each of said cavities, said fibrous material occupying throughout its length a portion only of the cross-sectional area of said cavity, and a septum inserted in each of the cavities adjacent the side of said sound absorbing material distal to said aperture means for controlling the effective volumes of the cavities in communication with the atmosphere.

3,275,102
HIGH TEMPERATURE LUBRICATION PROCESS
Rudolph J. Holzinger, Haddonfield, N.J., Lawton E. Reid, Kansas City, Mo., and Gilbert D. Blake, Overland Park, Kans., assignors to Mobil Oil Corporation, a corporation of New York
Filed Sept. 11, 1963, Ser. No. 308,273
8 Claims. (Cl. 184—1)



1. In a process for applying water-in-oil emulsion lubricants to hot moving mechanisms operating within a heated zone at ambient temperatures above about 300° F., the steps comprising:

(1) conveying the emulsion lubricant to and into the said heated zone;

(2) maintaining the said emulsion lubricant in an emulsified state under such temperature and pressure conditions as to prevent conversion of the water in the emulsion lubricant into steam prior to its application; and

(3) directing said emulsion lubricant in an exposed steam through said heated zone toward the hot moving mechanism, contact therewith causing the water to evaporate on the surface of the said mechanism, whereby the said evaporation cools and cleans the surface of the said mechanism and leaves a deposit of oil on the said surface.

3,275,103
BRAKE ROLLER RETAINER
Lyman R. Lyon, Royal Oak, Mich., assignor to Fruehauf Corporation, Detroit, Mich., a corporation of Michigan
Filed Oct. 11, 1965, Ser. No. 494,489
1 Claim. (Cl. 188—78)

In a brake assembly comprising a brake shoe having a pair of spaced webs, an S-cam, and a roller interposed therebetween,

a generally U-shaped roller retainer having a bight portion extending between the web portions of said brake shoe, and leg portions extending generally parallel to the web portions of said brake shoe, the leg portions of said retainer having axially aligned circular bores therein for the acceptance of opposite ends of said roller,

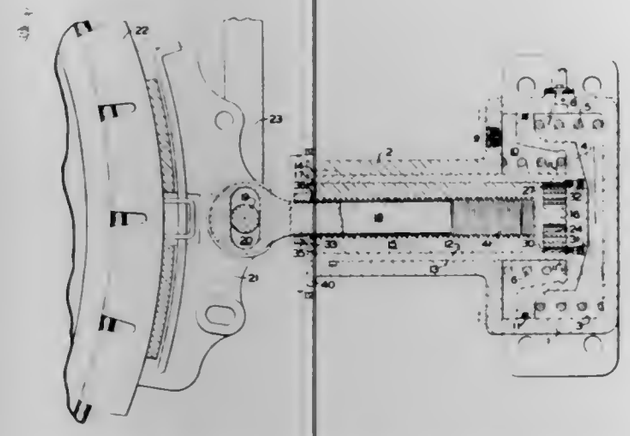
the periphery of the bores in the leg portions of said retainer being axially offset to define bearing surfaces, respectively, engageable with said roller to limit axial movement thereof, and

interlocking means on each of said legs engageable with the web portions of said brake shoe, respectively, for securing said retainer to said brake shoe.

3,275,104
BRAKE CYLINDER ASSEMBLY WITH CONTINUOUSLY ACTING SLACK ADJUSTER
Joseph G. Stipanovic, McKeesport, and Francis R. Racki, Pittsburgh, Pa., assignors to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed Sept. 29, 1964, Ser. No. 400,027
6 Claims. (Cl. 188—196)

1. A brake cylinder assembly comprising:

(a) a casing,



(b) a piston slidably operable therein,

(c) biasing means serving to bias said piston normally to a certain position and yieldingly permitting movement of said piston out of its normal position responsively to fluid pressure acting thereon one face thereof,

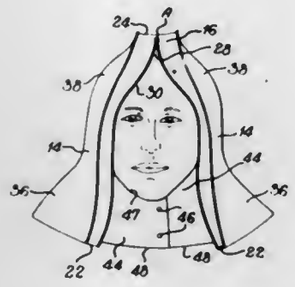
(d) a hollow cylindrical piston stem extending coaxially from the face of said piston opposite to said one face of said piston,

(e) a push rod for actuating a braking element, said rod having an externally screw-threaded portion,

(f) a sleeve rotable in a fixed axial position in said stem and having an internally threaded bore into which said screw-threaded portion of said push rod screws, rotation of said sleeve in opposite directions causing axial projection or retraction of said push rod from or into the sleeve, and

(g) means exerting a continuous torque in one direction on said sleeve to cause said push rod to constantly exert a light force on the braking element and effective to axially project said push rod with respect to said sleeve to take up slack as wear on the braking element occurs.

3,275,105
SHOE FOR SPOT TYPE DISC BRAKE
Robert Maxime Eugene Petit, Saint-Mande, France, assignor to Societe Anonyme Francaise du Ferodo, Paris, France, a corporation of France
Continuation of application Ser. No. 306,834, Sept. 5, 1963. This application May 14, 1965, Ser. No. 465,815
Claims priority, application France, Sept. 15, 1962, 909,604, Patent 1,340,988
1 Claim. (Cl. 188—250)

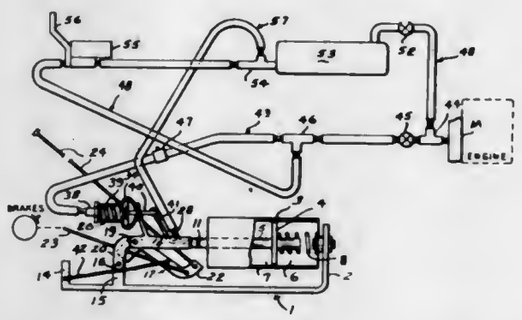


A brake including a brake shoe comprising a support member, a friction lining on one face of the support member, said brake shoe having a central portion and two edges, a fixed abutment, one of said edges contacting said fixed abutment along a contact surface, the thickness of the shoe central portion before wear and the width of said contact surface being substantially equal, said one edge having a thickness substantially greater than the thickness of said central portion whereby said contact surface maintains a substantially constant width as said friction lining wears away.

3,275,106
COMBINATION CARRYING CASE AND PROTECTIVE HOOD
Ralph A. Rush, 22 Bernard Road, East Brunswick, N.J.
Filed June 22, 1965, Ser. No. 465,852
9 Claims. (Cl. 190—1)

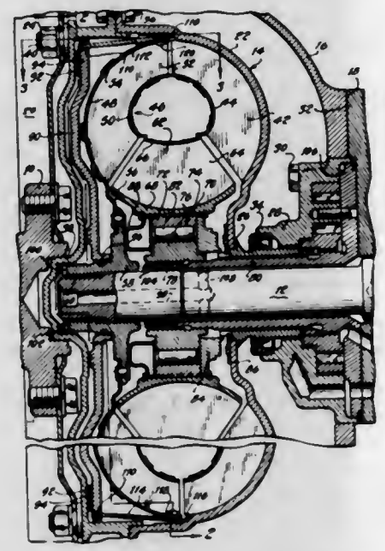
5. A combination carrying case and protective hood for the person comprising:

a body having an exterior and an interior and including opposed panels of relatively flexible material, said panels having opposed longitudinal edges and opposed lateral edges interconnecting said longitudinal edges, opposed longitudinal sides interconnecting the panels along the longitudinal edges and opposed lateral sides interconnecting the panels along the lateral edges and interconnecting the longitudinal sides;



an opening extending continuously along one longitudinal side, a portion of the opposite longitudinal side and an interconnecting lateral side, thereby leaving the opposite lateral side and the remainder of said opposite longitudinal side intact such that the panels and the intersecting intact sides will establish the crown of the hood when the opening is open;

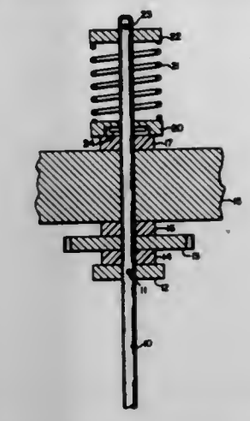
closure means for selectively maintaining said opening closed; and



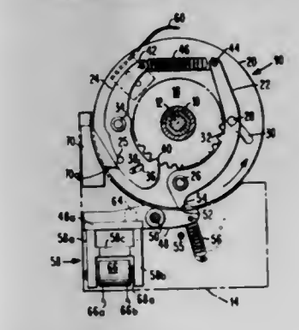
securing means fixed to the interior of said body along the panels for cooperating with portions of the head of said person to maintain the hood in place thereover.

3,275,107
AUTOMATIC EMERGENCY BRAKING SYSTEM RESPONSIVE TO MOTOR CONTROL
Damon I. Wolfe, 219 W. Main St., West Carrollton, Ohio
Filed June 17, 1960, Ser. No. 36,892
13 Claims. (Cl. 192—3)

1. An automatic control system for emergency brakes comprising, means defining a main vacuum line, means connected in said main line defining an auxiliary line, means for producing a vacuum in said lines, normally closed valve means in said auxiliary line, means in said auxiliary line to maintain a vacuum therein on subsequent failure of said vacuum producing means to do so, brake control means having a braking and a brake release position, said brake control means respectively having, on the one hand, an operative connection to said main line and the means maintaining a vacuum in said auxiliary line, and, on the other hand, an operative connection to the emergency brakes and being arranged thereby to automatically respond to a predetermined vacuum condition in said main and auxiliary lines to assume a brake release position and means in connection with said normally closed valve means having an operative connection to said vacuum producing means and arranged thereby to open said valve means to maintain the vacuum in said main line sufficient to cause the control means to be retained in a brake release position on a predetermined failure of the vacuum producing means to do so.



3,275,108
DAMPER FOR TORQUE CONVERTER LOCK-UP CLUTCH
Norman T. General, Farmington, and Po-Lung Liang, Lincoln Park, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Oct. 23, 1964, Ser. No. 406,061
6 Claims. (Cl. 192—3.3)



1. In a torque delivery driveline for delivering torque from a driving member to a driven member arranged coaxially with respect to each other, a plurality of recesses formed in one of said members at a radially outward location with respect to the common axis, cantilever spring means secured to the other member and extending in a generally axial direction, the extended ends of said spring means being received within said recesses, and said spring means comprising a yieldable portion engageable with one side of said recesses upon torque delivery through said driveline, another portion of said spring means frictionally engaging said recesses, said other portion of said spring means being adapted to create frictional dampening forces upon deflection of said one portion of said spring means during fluctuations in the magnitude of the torque delivered through said driveline, said driveline including a hydrokinetic mechanism having an impeller and a turbine defining a torus and being situated in fluid flow relationship, a selectively engageable friction clutch having two engageable friction parts, said driven member carrying one friction part and being shiftable under the pressure in said torus into engagement with the other friction part, said turbine being rotatable with and connected to said driven member and said impeller carrying said other friction part.

3,275,109
FRICTION COUPLING AND BRAKE CONTROL APPARATUS
Gregory J. Ganley, Minneapolis, Minn., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Nov. 12, 1964, Ser. No. 410,629
6 Claims. (Cl. 192—7)

1. In combination: an input shaft; a fixed member with respect to which said shaft is rotatable; an output element rotatable with respect to said shaft and to said member; first friction coupling means between said shaft and said element; second friction means between said member and said element; third friction means between said shaft and said member; and means maintaining interengagement of said member, said element, said shaft, and said friction means.

3,275,110
LATCH OPERATED CLUTCH WITH DUAL PAWLS
Theodore A. Lasky, Vestal, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 21, 1964, Ser. No. 391,176
10 Claims. (Cl. 192—28)

1. A clutch comprising:

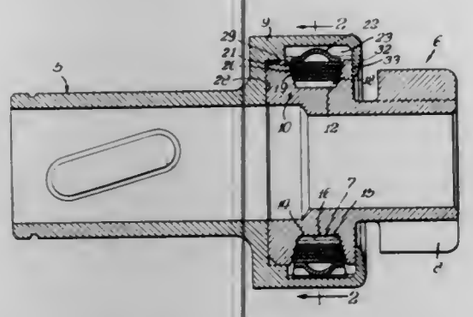
a member to be driven,

a driving member,

a primary clutch member carried by one of said members for engaging the other member in driving relation,

a secondary clutch member carried by said one member for engaging the said other member in driving relation,

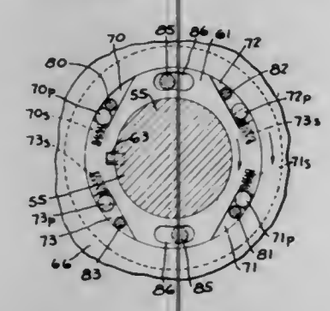
stationary means selectively operable to engage and actuate the primary clutch member to effect disengagement from said other member,



stationary cam means actuating the secondary clutch member to move it into engagement with said other member before the primary clutch member is disengaged,

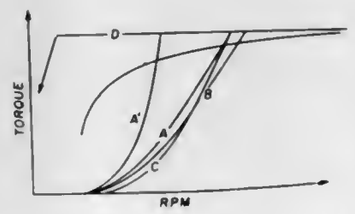
and resilient biasing means for the primary and secondary clutch members.

3,275,111
BAND CLUTCH WITH CUP SHAPED OUTER MEMBER
Ernest U. Lang and Edwin E. Mallory, Niles, Mich., assignors to National-Standard Company, Niles, Mich., a corporation of Delaware
Filed June 26, 1964, Ser. No. 378,233
1 Claim. (Cl. 192—41)



A unitary clutch assembly consisting essentially of outer and inner clutch members, said outer clutch member having a cup-shaped portion of hardened steel stock at one

end thereof, said cup-shaped portion having an annular internal shoulder at its inner end, said inner clutch member having one end thereof disposed coaxially of the axis of said cup-shaped portion and in telescoping relation thereto, said one end of said inner clutch member being of hardened steel stock having bearing surfaces at its inner end in bearing engagement with said annular internal shoulder of said cup-shaped portion, one-way

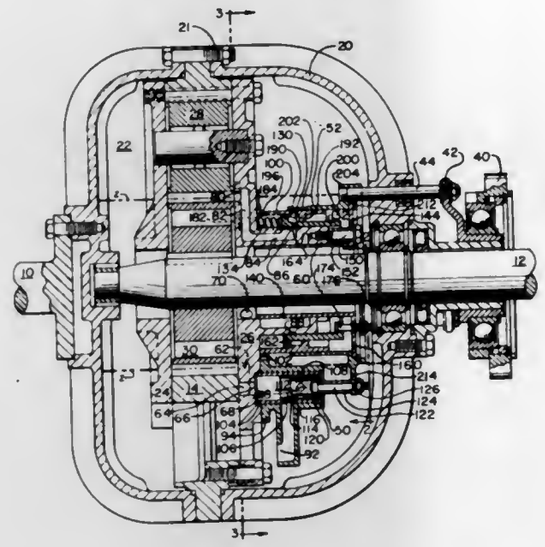


torque transmitting means between said one ends of said clutch members, and flange means integral with but softer than said cup-shaped portion at the open end thereof extending radially inwardly toward and having bearing engagement with the outer end of said inner clutch member to retain said clutch members assembled in coaxial relation with respect to each other and with said torque transmitting means in assembled relation therebetween.

3,275,112
REVERSIBLE ONE WAY CLUTCH
Herbert Nagel, Detroit, Mich., assignor to Wolverine Flexographic Mfg. Co., Detroit, Mich., a corporation of Michigan
Substituted for abandoned application Ser. No. 202,460, June 14, 1962. This application July 6, 1964, Ser. No. 380,334
1 Claim. (Cl. 192—44)

In a clutch mechanism, a rotatable outer member having a central cylindrical recess and a rotatable inner member operatively arranged within said recess to have its outer surface adjacent the inner cylindrical walls of the cylindrical recess, said inner member being provided in its outer surface with an even plurality of wedge recesses, one-half of said recesses pointing in one direction with respect to member rotation and the other half in the opposite direction, a corresponding plurality of driving pins operatively arranged in said recesses, said pins having diameter smaller than the greatest depth of said recesses, a reversing member associated with said inner member and having a corresponding plurality of fingers projecting into said recesses in front of said driving pins in such positions that in one position of the reversing member the driving pins in one half of the recesses are free to move into their respective wedging-in positions between the inner and the outer member for drivingly connecting the same while the driving pins of the other half of the recesses are held by their respective fingers back at their respective idling positions, with said reversing member being adapted to be moved and fixed in another position relative to the inner member, at which position the fingers that previously held half of the pins in their respective idling positions move to allow said pins to wedge in for driving in the opposite direction while the remaining fingers move their respective pins in the idling position, the reversing member comprising a pair of annular plates mounted adjacent the ends of the inner members, screws spaced from said fingers and extending through axially extending passages in the inner member, the diameter of each passage being greater than the diameter of each screw in a circumferential direction relative to the axis of the clutch mechanism, said screws secured to said plates so as to maintain said plates in engagement with opposite ends of said inner member, and said fingers extending between and secured to said plates.

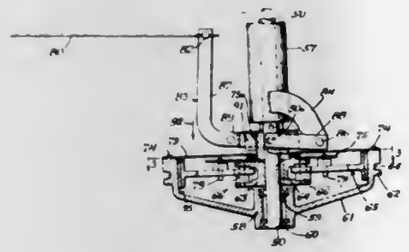
3,275,113
CLUTCH
Bunzo Hirano, 539 Nishinoshima, Toyotamura, Iwata-gun, Shizuoka, Japan
Original application Sept. 9, 1963, Ser. No. 307,681. Divided and this application Oct. 19, 1965, Ser. No. 510,726
6 Claims. (Cl. 192—52)



1. A clutch comprising a driving member, a driven member, means mounting said members for rotation about a common axis and for limited relative translation along said axis to vary the effective axial thrust between said members, a driving disc rotatable about said axis, an elastic body connecting said driving disc and driving member for rotation as a unit and for limited relative angular movement about said axis in response to deformation of said elastic body, by and proportional to torque applied to said driving disc, said deformation acting to decrease the effective thrust between said members, and means responsive to rotational speed of said driving disc and effective to urge the same axially toward said driving member with a force proportional to said rotational speed, and correspondingly increase the thrust between said members, through said elastic body.

3,275,114
CONSTANT SPEED CONTROL MEANS FOR VARIABLE POWER TRANSMITTING HYDRAULIC APPARATUS
John R. Thomas, 437 Floyd, Wichita, Kans.
Filed Aug. 17, 1964, Ser. No. 389,945
21 Claims. (Cl. 192—61)

21. In hydraulic apparatus employing fluids and transmitting torque from a rotary driving member to a rotary driven member at selective levels of speed which are effected by control means varying the quantity of fluid being circulated in fluid passageways between driving and driven means, constant speed control means maintaining the selected speed being transmitted from said driving member to said driven member, comprising:

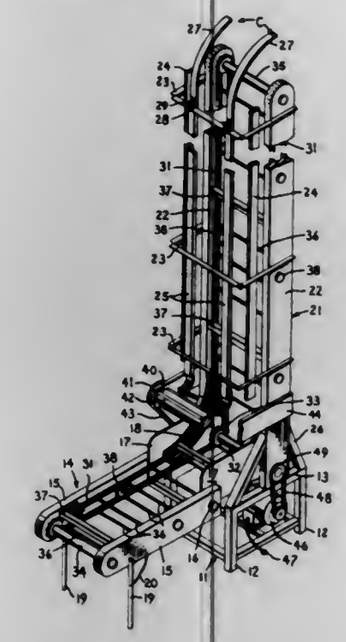


(a) pressure sensitive means sensitive to static pressures in said fluid passageways and giving a control action responsive to variation in pressure above and below levels selected in said pressure sensitive means by said control means, and

(b) means regulating the quantity of fluid circulated in said fluid passageways and connected to and adjusted responsive to control action from said pressure sensitive means, whereby a constant output speed effect is achieved because the level of static pressure in said passageways varies as quantities of fluid being circulated varies and because any change in torque

tending to change speed of relative rotation between said rotary driving and driven members results in changes in static pressure thereby acting on said pressure sensitive means and in turn adjusting said regulating means to increase or decrease fluid being circulated to restore the same to its level before imposition of change in torque.

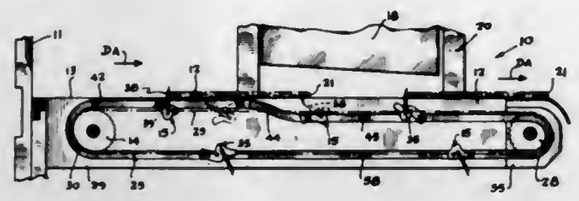
3,275,115
CLUTCH
John R. Timberlake, Downers Grove, Ill., Harvey O. Halstensgard, La Habra, Calif., and Arlie J. Thayer, Brookfield, Ill., assignors to International Harvester Company, a corporation of Delaware
Continuation of abandoned application Ser. No. 153,830, Nov. 21, 1961. This application Jan. 27, 1965, Ser. No. 440,974
3 Claims. (Cl. 192—75)



1. A self-locking and self-unlocking clutch for an intermittently operated machine such as a bale thrower wherein the clutch automatically locks in engaged position after actuation and automatically unlocks to terminate the machine operating cycle after a predetermined period of operation, comprising: a supporting structure for said clutch, said supporting structure including a rotary drive shaft forming a clutch driven member, a clutch driving member having a driving surface, said clutch driving member being mounted for rotation on said supporting structure, a hub fastened on said drive shaft for rotation therewith, a clutch arm having a driven surface at one end thereof and a counterweight at the other end thereof, means pivotally mounting said clutch arm on said hub intermediate said driven surface and said counterweight, said clutch arm being pivotal between a first position wherein said driving member driving surface and said clutch arm driven surface are disengaged and a second position wherein said driving member driving surface and said clutch arm driven surface are engaged to form a driving connection between said clutch driving member and said clutch driven member, said pivotal mounting means being located with respect to said driving member driving surface to lock said clutch arm in said second position when said driving member driving surface and said clutch arm driven surface are engaged to form said driving connection, said counterweight being located with respect to said pivotal mounting means to produce a centrifugal force for unlocking said clutch arm from said second position and moving it to said first position to completely break said driving connection between said clutch driving member and said clutch driven member to terminate an operating cycle of said intermittently operated machine after a predetermined period of operation, actuating means joined to said clutch arm for pivoting it from said first position to said second position, cycle initiating means on said supporting structure for applying a force to said actuating means, said cycle initiating means being rendered inactive after application of said force to enable said actuating means and said clutch arm to return to said first position when said counterweight produces said centrifugal force.

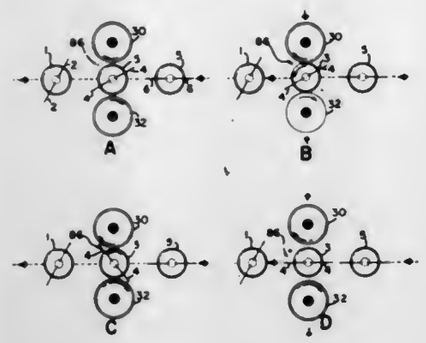
3,275,116
AIR POWERED TOOL WITH OVERLOAD CUTOFF
Paul W. Martin, Springfield, Ohio, assignor to The Aire-tool Manufacturing Company, Springfield, Ohio, a corporation of Ohio
Filed Oct. 12, 1964, Ser. No. 403,114
12 Claims. (Cl. 192—150)

1. A power tool comprising; a housing, a rotary air actuated motor within said housing, a passageway through which a supply of air under pressure is delivered to said motor, a valve for controlling the air through said passageway, means normally closing said valve to shut off said supply of air, a spindle adapted to be moved axially inwardly and outwardly of said housing under certain conditions of operation, rotation transmitting clutch means including an axially movable member between said motor and said spindle adapted to disengage at a predetermined torque resistance to rotation of said spindle, a valve opening member adapted to open said valve upon the axial inward movement of said spindle, and a trip member pivotally mounted on said spindle and operative to normally transmit the axial inward movement of said spindle to said valve opening member to open said valve, said axially movable member of said clutch means being adaptable to contact and release said trip member upon a predetermined resistance to rotation of said spindle permitting said means to close said valve upon the release of said trip member.



3,275,117
COMPACT VERTICAL BALE ELEVATOR
Terrence O. Weigel, R.F.D. 1, Sauquoit, N.Y.
Filed Oct. 19, 1964, Ser. No. 404,566
2 Claims. (Cl. 198—7)

1. A vertical bale elevator comprising a support base, a bale receiving bed depending horizontally from a side of said base; elevator frame means including opposing vertical beams carried by said base and guide rails spaced from said beams for guiding said bales; discharge guides comprising an arcuate member, pivotally connected at one end to the top of said frame means, and a loading torsion spring connected between said frame means and said guide, said torsion spring adapted to maintain said guide in normal bale discharge position and adapted to permit movement of said guide during passage of a bale thereby, and adapted to positively propel said bale forward in discharge relationship to the elevator frame means; driven elevator chain means comprising a pair of endless link chains disposed along said vertical beams and said bed operative to move a bale from said bed into said frame means and elevate the bale; bale support flights spaced along said chain means for moving said bales vertically up said chain; drive means interconnecting said chains for movement at the same speed; a bale feed roller including cleats operative to urge a bale upwardly into said frame means from said bed; and power means comprising a motor operatively connected to said drive means and said feed roller.

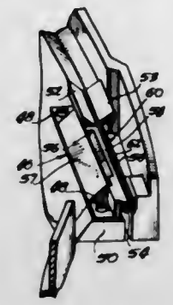


3,275,118
TRIMMING MACHINE
William B. McCain, Hinsdale, and Raymond I. Bulka, Oak Lawn, Ill., assignors to Chicago Machinery Laboratory, Inc., Chicago, Ill., a corporation of Illinois
Filed Apr. 15, 1965, Ser. No. 448,347
10 Claims. (Cl. 198—19)

1. In a signature machine having an operating station to which signatures are delivered prior to being operated upon and from which said signatures are removed after being operated thereupon; a continuous cam means having a first cam portion extending from a first location to said operating station, a medial cam portion at said operating station and a terminal cam portion extending from said medial cam portion at said operating station to a second location; an endless band; a first and a second driving finger rotatably mounted on said endless band at spaced locations; a cam following portion on the first of said driving fingers engaging said first cam portion of said cam means and for holding said first driving finger in an operative position to engage a signature and to push the signature to said operating station, said medial cam portion of said continuous cam means adapted to force said first finger to rotate to an ineffective position and said terminal cam portion of said cam means holding said first

finger in said ineffective position, and a cam following portion on said second finger to hold said second finger in ineffective position along said first portion of said cam means, said medial portion of said cam means forcing said second finger to rotate to an operative position to engage a signature and to push said signature from said operating station, said terminal portion of said cam means holding said second driving finger in an operative position to move said signatures.

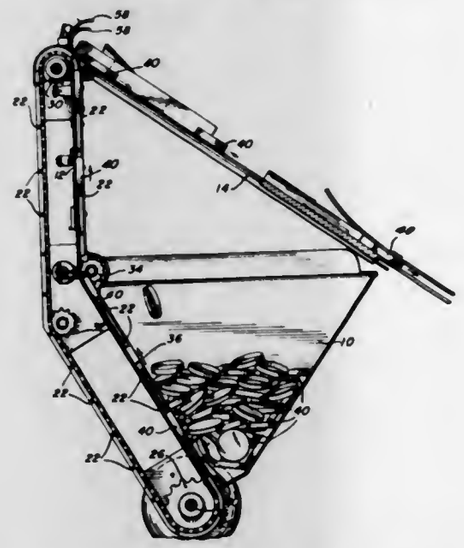
3,275,119
LEAD-IN WIRE ORIENTING APPARATUS
Stanley C. Shappell, West Boxford, Mass., assignor to Sylvania Electric Products Inc., a corporation of Delaware
Filed June 28, 1963, Ser. No. 291,335
2 Claims. (Cl. 198—33)



1. Apparatus for effecting orientation, in a pre-determined reference plane, of the lead-in wires extending from an end of a substantially tubular lamp envelope and lying in a random plane, said apparatus comprising:

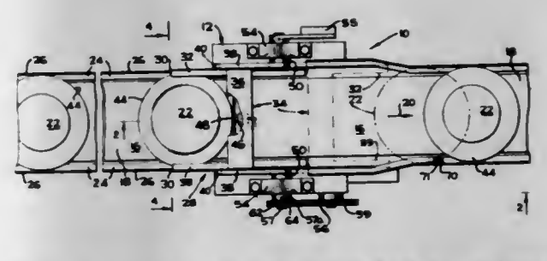
means for rotating said tubular lamp envelope about its own longitudinal axis;

a normally closed electrical circuit including a pair of electrical contacts and a deflectable conductive finger, said finger normally bridging said electrical contacts and lying in the path traversed by said lead-in wires during rotation of said lamp envelope, said finger being deflectable out of engagement with one of said electrical contacts by engagement therewith of only one of said lead-in wires whereby said normally closed electrical circuit is opened;



and means, controlled by the opening of said normally closed electrical circuit, for terminating the rotation of said lamp envelope whereby said lead-in wires are caused to assume a disposition in a pre-determined reference plane.

3,275,120
ALIGNMENT MEANS FOR VIBRATORY FEEDERS
George J. Gardner, Fairview, Pa., assignor to Automation Devices, Inc., Erie, Pa., a corporation of Pennsylvania
Filed May 25, 1964, Ser. No. 369,686
4 Claims. (Cl. 198—33)



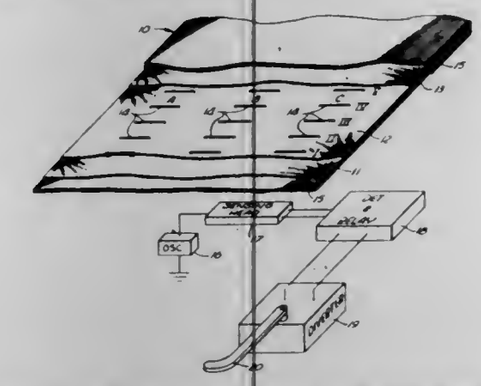
1. Alignment means for a vibratory feeding device for vertically aligning parts, each of which includes a head portion and a tail portion, said feeding device having a ledge and an inclined track, said alignment means comprising a first member having a sloped portion which constitutes an extension of said track, a portion which is step-shaped having an upper step thereof cut-away in a sloped fashion to provide a spill-way for parts and to provide a narrow rail, a pair of elongated apertures formed in said first member at each of its ends and fastening means extending through said elongated apertures for adjustably securing said first member to said ledge, and a second member having a sloped portion which constitutes an extension of said track and a portion which is cut away to provide a narrow rail which together with said narrow rail on said first member define a track, fastening means for adjustably securing said second member to said feeding device, said second member being positionable to provide an adjustable slot between said pair of narrow rails for receiving and vertically aligning said parts with the tail portion thereof extending downwardly through said slot and said head portion riding on said track.

3,275,121
LID ARRANGEMENT APPARATUS
Martin Mueller, Chicago, Ill., assignor to Seymour C. Graham
Filed Nov. 19, 1964, Ser. No. 412,510
7 Claims. (Cl. 198—33)

1. An apparatus for unscrambling and orienting container lids, each of said lids having a closed side and a skirt member depending therefrom to frame an open side which comprises: a hopper for containing a plurality of lids, one wall of the hopper being substantially flat and extending at an inclined angle with respect to the horizontal; a back member above said wall having a substantially vertical planar surface connected in continuous relationship with said wall; lid conveying means associated with said hopper for conveying the lids contained therewithin, said conveying means including a plurality of horizontally extending platforms in parallel with one another; driving means connected to said platforms for moving said platforms upwardly parallel to said one wall for receiving the lids and thereafter upwardly parallel to said back member for orienting the lids, said moving platforms extending from said back member at a distance which is farther from said back member than the center of gravity of said lids when said lids have their closed sides facing said back member and nearer to said back member than the center of gravity of said lids when said lids have their open sides facing said back member, whereby improperly oriented lids will fall from said platforms; and means for distributing the oriented lids from said conveying means to a delivery station.

3,275,122
PLATE INVERTING MECHANISM
Heinz F. Carlson, Santa Clara, Calif., assignor to FMC Corporation, a corporation of Delaware
Filed Nov. 27, 1964, Ser. No. 414,234
10 Claims. (Cl. 198—33)

1. Plate inverting apparatus comprising a continuously driven conveyor arranged to convey from upstream to downstream positions a lane of plates lying in random upright and inverted positions, a plate gripper mounted over said conveyor, means mounting said plate gripper for movement between a receiving position in which said conveyor moves the leading upright one of said plates into supported relation with said plate gripper, an intermediate position wherein the supported plate is out of engagement with said conveyor, and a discharge position in which the initially upright plate is inverted and its downstream rim portion lies on said conveyor, means carried by said plate gripper for slidably receiving the laterally opposed rim portions of said leading plate for movement of the plate with said gripper, power means for effecting movement of said gripper from said receiving position to said discharge position, and means for sensing the presence of a plate supportingly engaged by said plate gripper in said receiving position and operative to energize said power means for movement of said gripper to said discharge position.

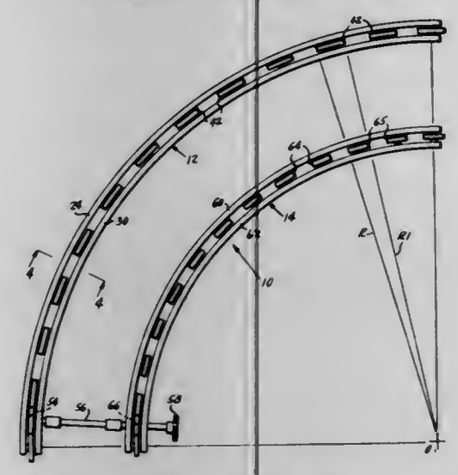


3,275,123
CONVEYOR BELT WITH CODE ELEMENTS
David C. Prosser, Minnetonka Village, and Jacob A. Ronning, Jr., Wayzata, Minn., assignors, by mesne assignments, to Cutler-Hammer, Inc., a corporation of Delaware
Filed Feb. 27, 1963, Ser. No. 261,323
2 Claims. (Cl. 198—38)

1. An endless conveyor belt for extending over a conveyor frame and driving mechanism and for use with magnetic coding and detecting apparatus comprising:

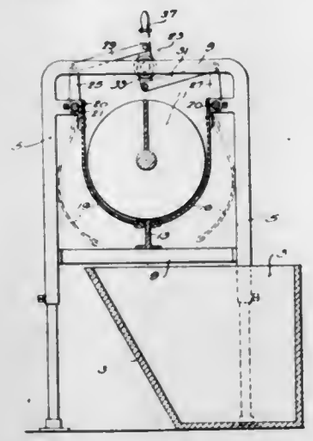
(a) a plurality of flat plies of reinforcing non-mag-

netic woven fabric forming an endless body of tension resisting material having flexibility and adapted for cooperatively engaging the conveyor frame and driving mechanism;



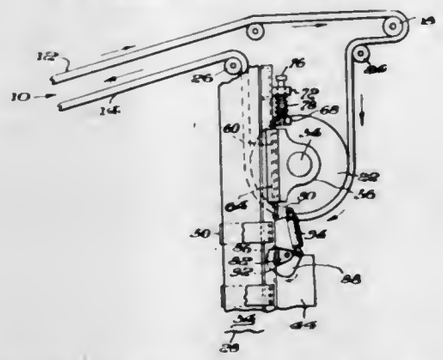
(b) a plurality of separated magnetic code retaining elements spaced apart so that each is capable of being magnetized with a portion of a code and retaining a magnetic field for code sensing purposes until demagnetized, said elements fixedly secured to at least one of said plies of fabric and arranged in at least one non-continuous row extending longi-

tudinally of said belt, the longest dimension of said elements being substantially less than the width of the conveyor belt, said code retaining elements being of elongate shape and disposed with the longer dimension of said elongate shape extending transverse to the direction of the row containing said elements;



(c) and an elastic non-magnetic material completely encircling and impregnating said plurality of plies of fabric to form a laminated belt with said code retaining elements completely embedded therein.

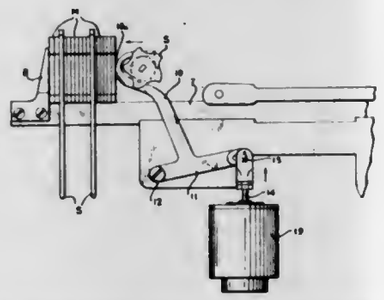
3,275,124
BELT DRIVEN LIVE ROLLER CONVEYOR
Harry L. Lutes, Centerville, and Robert J. Smith, Dayton, Ohio, assignors to Kornylak Corporation, Hamilton, Ohio, a corporation of New Jersey
Filed Oct. 22, 1964, Ser. No. 405,702
8 Claims. (Cl. 198—127)



1. In a power driven roller conveyor, two parallel rollerways, each formed on the arc of a circle, and wherein each rollerway comprises a pair of spaced apart channels having their bases facing one another, rollers longitudinally spaced mounted between the channels and projecting slightly above the channels, idler rollers located between the channels below and intermediate the first mentioned rollers, and wherein each roller is substantially a section of a cone parallel to its base, and the vertex of which is the center of curvature of the rollerway belt means for driving the rollers, means urging the idler rollers toward the other rollers and the belt means, and means for moving the belt means.

3,275,125
AUGER FEEDER
George D. Prentice, Milwaukee, Wis., assignor to A. F. Klinzing Co., Inc., Milwaukee, Wis., a corporation of Wisconsin
Filed Dec. 21, 1964, Ser. No. 419,879
4 Claims. (Cl. 198—205)

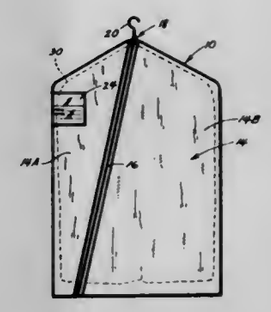
1. An elongated auger type feeder comprising:
a frame;
a centrally located rail extending the length of the frame;
an auger screw rotatably mounted in said frame and resting on said rail;
a pair of curved doors pivotally mounted on said frame on opposite sides of the auger screw to enclose the lower portion of the auger screw and to abut said rail when closed; and
means to pivotally open said doors to disperse feed along the length of the feeder.



3,275,126
SAFETY DEVICE FOR SUSPENDED CONVEYOR TAKE-UP MECHANISMS
Harry F. Hartzell, Jr., Allison Park, Pa., assignor to Koppers Company, Inc., a corporation of Delaware
Filed Feb. 17, 1965, Ser. No. 433,306
5 Claims. (Cl. 198—208)

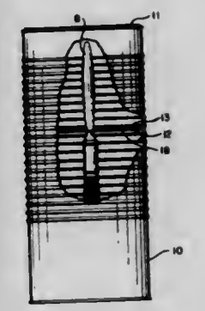
1. A take-up mechanism for an endless flexible conveyor belt comprising
a vertically movable counterweight frame having a pair of speed side members,
a fixed guide member operable to guide said counterweight frame in a vertical direction,
an idler roller having shaft end portions positioned in overlying relation with said frame side members,
support members for said shaft end portions, said support members connected to said frame side members and movable linearly relative thereto,

resilient means urging said support members in a first direction relative to said frame side members, said support members arranged to oppose said urging means by the tension of an endless flexible conveyor belt reeved around said idler roller, and
means to engage said counterweight frame to said fixed guide member upon movement of said support members in a downward direction relative to said support frame by said resilient means urging said support members in a first direction upon release of tension in said endless flexible conveyor belt reeved around said indler roller.



3,275,127
ASSEMBLING APPARATUS FOR LINECASTING MACHINES
Karl Debus, Bad Homburg vor der Hohe, Germany, assignor to Linotype G.m.b.H., Frankfurt am Main, Germany
Filed Feb. 16, 1965, Ser. No. 433,025
20 Claims. (Cl. 199—21)

1. In a linecasting machine, in combination, assembling apparatus comprising an assembler slide having an abutment mounted for moving in an assembling direction; transporting means disposed so that a portion of said assembler slide is located between said abutment and said transporting means, said transporting means being driven to successively assemble matrices on said portion of said slide in a row extending in said assembling direction and to stepwise move said abutment in said assembling direction distances corresponding to the thickness of regular matrices by the pressure exerted by said transporting means through the assembled matrices on said abutment; and auxiliary spacing means operable for moving said abutment in said assembling direction a greater distance corresponding to the thickness of a comparatively large matrix so that said abutment is moved away from said transporting means for providing additional space for large matrices.

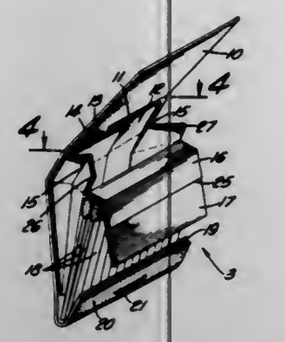


3,275,128
GARMENT COVER
Charles W. Neely, Corydon, Iowa, assignor to Neely Manufacturing Co., Inc., Corydon, Iowa, a corporation of Iowa
Filed June 3, 1965, Ser. No. 461,110
3 Claims. (Cl. 206—7)

1. In a garment cover,
an envelope container having forward and rearward panels forming a compartment therebetween suitable for housing a garment,
said forward and rearward panels being comprised of an opaque material and each having inside and outside surfaces,
an access opening in said envelope container suitable for inserting or removing a garment into or out of, respectively, said compartment,
an opening in at least one of said panels,
a transparent closure means in said compartment secured to the inside surface of said one panel and closing said opening, said closure means having inside and outside surfaces,
and a pocket means superimposed on said closure means at the inside surface thereof, said pocket means cooperating with said transparent closure means to form a pocket therebetween,
said pocket having an access opening positioned inside said compartment,
said pocket means being smaller in area than said closure means,

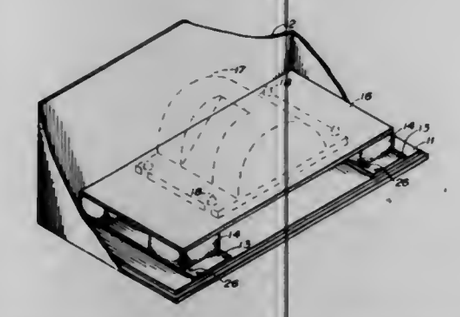
said pocket means being positioned on said closure means in the area of said opening in said one panel to leave a portion of said closure means uncovered,
said uncovered area of said closure means extending only from the top edge of said pocket means to the top edge of said opening in said one panel,
the access opening into said pocket being between the top edge of said pocket means and the inside surface of said closure means.

3,275,129
PAINT BRUSH KEEPER
Donald H. Snyder, Blissfield, Mich.
Filed Apr. 8, 1964, Ser. No. 358,274
3 Claims. (Cl. 206—15.1)



1. A paint brush keeper comprising a can closed at the bottom and open at the top, means for closing the top, a series of vertically spaced circumferential grooves disposed interiorly of the can, a resilient wire bracket of generally semi-circular shape adapted to be snapped into a selected groove, a rod for suspending paint brushes thereon, and means spaced inwardly from each end of said wire for supporting the end portions of said brush suspending rod.

3,275,130
MATCHBOOK WITH ASHTRAY COMPARTMENT
Ernest G. Van Leeuwen, 7120 Melrose Ave., Los Angeles, Calif.
Filed Sept. 3, 1964, Ser. No. 394,213
2 Claims. (Cl. 206—38)



1. A matchbook of the type wherein a bank of paper matches is contained in a cover which extends upwardly to form a front tab bearing a striking strip, across the

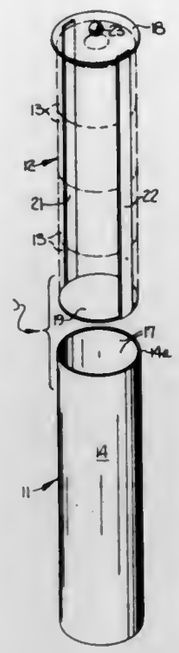
bottom, up the back and downwardly in front to form an opening or closing tab the improvement comprising: a paper member attached to said bank of matches adjacent the bottom thereof and extending up over the top of said matches and downwardly in front thereof; said

paper layer also extending across the sides of the book and having overlapping portions affixed to the back of said book; the sides of said member being foldable inwardly and extending upwardly beyond the top of said matches; and a metalized sheet attached to said member to form a closed metal pocket when said book is closed.

3,275,131
SHOCK ABSORBING SYSTEM FOR CONTAINERS
Arthur W. Erickson, 2510 De Koven Ave., Belmont, Calif.
Filed Apr. 2, 1965, Ser. No. 445,071
6 Claims. (Cl. 206—46)

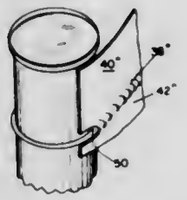
6. A package suitable for objects which are to be protected from jars and shocks, comprising a box, a shock absorbing unit resting on the bottom of said box, said shock absorbing unit comprising a lower base plate, resilient foam blocks secured to the upper surface of said base plate, an upper plate secured to and overlying said resilient foam blocks, and a plurality of insertable resilient foam modules which are insertable between said upper and lower base plates to increase the load carrying and shock absorbing capacity of said unit.

3,275,132
DISPENSER FOR MATERIAL IN SLENDER STICK FORM
George W. Hultgren, Bridgeport, Conn., assignor to United Tool & Plastics, Inc., Bridgeport, Conn., a corporation of Connecticut
Filed Feb. 17, 1964, Ser. No. 345,370
2 Claims. (Cl. 206—56)



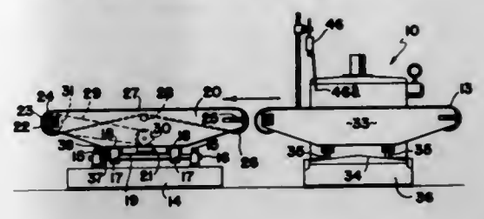
1. A dispensing device for an elongate stick-like article comprising a hollow body of plastic material forming an article-receiving tube open at one end and having a transverse wall at the other end having a central aperture therein provided with at least one flat side wall, said body adjacent said other end being cylindrical, an operator of plastic material having a tubular end and a bore of reduced diameter extending inwardly therefrom, said tubular end telescopically receiving said cylindrical portion of the body to be mounted thereon for relative rotation, cooperating projection and recess means on said telescoped portions of the body and operator to releasably hold the body and operator against longitudinal separation, said resilient plastic material of the cooperating body and operator permitting the projection to snap into said recess incident to the telescoping thereof, said body having a finger grip configuration on the outer surface thereof adjacent the end of the operator mounted thereon, an article carrier having an article mounted thereon slidably mounted in the tube and having a screw rigidly connected thereto, said screw projecting through the central aperture in the body and into the bore in said operator and

having at least one flat side to cooperate with the flat side wall of the aperture in the transverse wall to prevent rotation of the screw and carrier in the body, and a separate feed nut threaded on the projecting portion of the screw and normally located adjacent the transverse wall, said bore in said operator adjacent said tubular portion being enlarged and forming an open-ended socket receiving said nut having an end portion for engaging the nut when the operator is assembled on the body, said wall and end of the socket holding the nut in said normal position in said socket, said socket and nut having cooperating engaging side walls provided with means for preventing relative rotation between the operator and nut whereby rotation of said operator on said body, while the body is held by the finger grip configuration, causes the nut to cooperate with the screw and advance or retract the article carrier and cause the article mounted therein to be projected from or retracted within said body for use or storage.



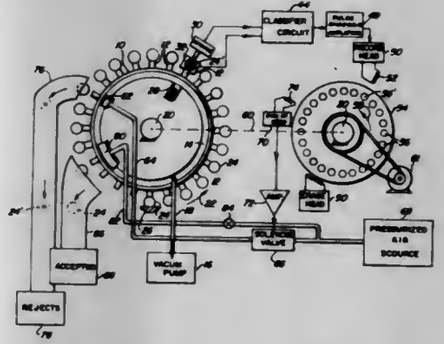
3,275,133
PAPER ROLL DISPENSER
Ruby A. Wood, 1786 Opal Ave., Charleston, S.C.
Filed June 15, 1965, Ser. No. 464,158
3 Claims. (Cl. 206—56)

2. A paper roll dispenser comprising, in combination, a tubular housing having an upper edge, an insert for supporting a plurality of paper rolls receivable within said housing in telescoping relationship therewith, means for supporting said insert in said housing, said insert comprising a top and bottom member, a pair of rigid side strips interconnecting said top and bottom members and arranged in a diametrically opposed, spaced apart relationship corresponding to the diameter of said rolls, said side strips having an arcuate cross sectional shape corresponding to the outer surface of said rolls, said bottom member being arranged to support a plurality of rolls in vertically stacked relationship and in yieldable retaining engagement between said side strips to permit said rolls to be individually inserted and removed in



a snap fitting operation when said insert is withdrawn from said housing.

3,275,134
LABEL PACK
Kenneth D. Bixler, Huntington, N.Y., assignor to Diamond International Corporation, New York, N.Y., a corporation of Delaware
Filed July 17, 1964, Ser. No. 383,403
8 Claims. (Cl. 206—65)

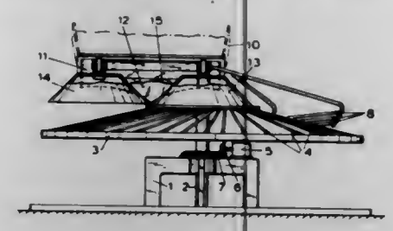


1. A package comprising:
a first cylindrical container;
a second cylindrical container positioned end-to-end coaxially with said first container and having generally the same peripheral length as said first container, said second container having a chime at the end thereof adjacent said first container; and
a single common label adhesively affixed to said containers to unite said containers in said end-to-end coaxial relation, said label having
(a) adhesive on two opposite edges thereof,
(b) a weakened portion of the plane of contact between said containers and intersecting said label portions having adhesive thereon, and
(c) a clearance cut along one of said adhesive coated edges at the end of said weakened portion, said chime extending through said clearance cut so that said chime extends beyond a plane tangent to said containers through said label portion having adhesive thereon.

3,275,135
CHECKWEIGHING AND ASSORTING SYSTEM HAVING A TILTABLE CONVEYOR BELT
Leo J. Niese, Toledo, Ohio, assignor to Toledo Scale Corporation, Toledo, Ohio, a corporation of Ohio
Filed Dec. 23, 1963, Ser. No. 332,515
16 Claims. (Cl. 209—74)

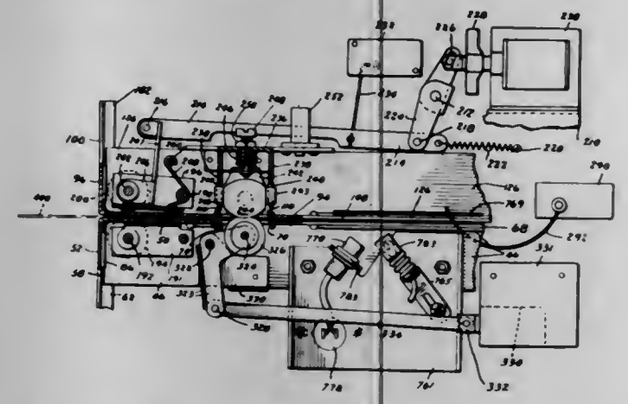
16. A checkweighing system comprising, in combination, a checkweigher including conveyor means, and a segregation device including an endless conveyor belt, the conveyor means and the conveyor belt being arranged to move articles to be checkweighed and segregated in main stream flow from a loading end of the conveyor means to a discharge end of the conveyor belt, and means for tilting the conveyor belt to one side of said main stream flow.

3,275,136
APPARATUS FOR DETECTING SEEDS IN FRUIT
Kenneth M. Allen, Newberg, and Lyle H. Van Dyke, Jr., and Rex L. Breunsbach, Portland, Oreg., assignors to Allen Fruit Co., Inc., Newberg, Oreg., a corporation of Oregon
Filed Oct. 9, 1964, Ser. No. 402,818
10 Claims. (Cl. 209—74)



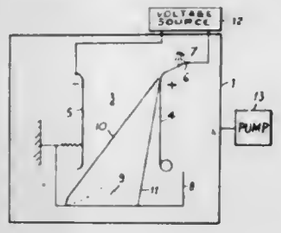
1. Apparatus for detecting seeds in fruit comprising:
a source of light;
means for positioning the fruits adjacent said source to cause the light emitted therefrom to be transmitted through one fruit;
detector means positioned in two different light paths in common with said one fruit to receive the light transmitted from said one fruit in two different directions and to produce an electrical signal whose amplitude depends upon the amount of light received by said detector means which decreases in one of said paths when the fruit contains a seed; and
classifier means connected to said detector means, for producing an output signal when the change in amplitude of the detector output signal is sufficiently great to indicate the presence of a seed in said one fruit.

3,275,137
FRUIT SIZING AND SORTING MACHINE
Jan M. van den Munckhof, 65 Meterikseweg, Horst, Limburg, Netherlands
Filed Feb. 3, 1964, Ser. No. 341,893
Claims priority, application Italy, Feb. 13, 1963, 3,167/63
9 Claims. (Cl. 209—99)



1. A machine for sorting to size fruit, or the like, comprising a substantially vertical hub, means for rotating the

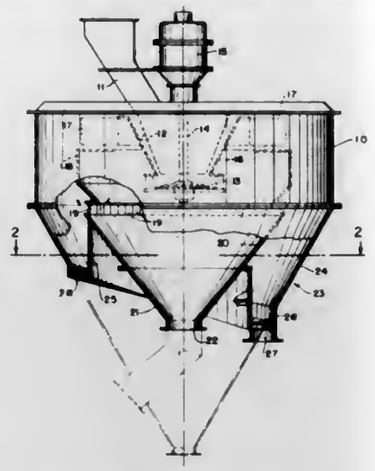
hub about its axis, a plurality of substantially equiangularly spaced, outwardly directed spokes fixed to the hub and forming a fruit supporting surface, and a stationary guide member above and spaced from said fruit supporting surface and extending substantially in a spiral from near



said hub toward the outer edge of said fruit supporting surface, each pair of said spokes cooperating with the guide member to form a three sided sorting slot for the fruit which increases in size as the fruit supporting surface turns with respect to the stationary guide member.

3,275,138
METHOD AND APPARATUS FOR DETECTING CURRENCY
Bernard S. Cahill, Mount Prospect, Ill., assignor to National Rejectors, Inc., St. Louis, Mo., a corporation of Missouri
Original application Jan. 24, 1961, Ser. No. 84,643, now Patent No. 3,180,491, dated Apr. 27, 1965. Divided and this application Aug. 2, 1963, Ser. No. 299,576
8 Claims. (Cl. 209—111.7)

6. Apparatus for identifying and accepting authentic currency comprising bill-gripping members that can grip a bill, a light-sensitive element, said bill-gripping members and said light-sensitive element being movable relative to each other to cause relative movement between two differently-colored portions of a bill and said light-sensitive element, said light-sensitive element receiving light from both of said differently-colored portions of said bill during at least part of the relative movement of said light-sensitive element and said bill-gripping members, a circuit responsive to changes in the amount of light received by said light-sensitive element, said circuit providing an accept signal only if the bill is authentic and of predetermined denomination and causes light from both of said differently-colored portions thereof to reach said light-sensitive element, said circuit not providing an accept signal if said bill is not authentic or is not of predetermined denomination or does not cause light from both of said differently-colored portions thereof to reach said light-sensitive element, and a member that has a portion thereof which directs a finite, predetermined, minimum amount of light onto said light-sensitive element whenever a bill is not in position to cause light to fall onto said light-sensitive element, said portion of said member being much smaller than said bill and at least one of said differently-colored portions of said bill being spaced inwardly of the edges of said bill so said bill completely overlies said portion of said member, and thus substantially keeps said portion of said member from directing light onto said light-sensitive element, for a period of time commencing prior to the instant the innermost of said differently-colored portions of said bill starts directing light onto said light-sensitive element and concludes after both of said differently-colored portions of said bill have directed light onto said light-sensitive element, said light-directing member having a light-directing value which is close to the light-directing value of one of said differently-colored portions of said bill, whereby the values of light received by said light-sensitive element prior to, during, and after said bill causes light to fall onto said light-sensitive element are within predetermined limits, said light-directing value of said light-directing member being sufficiently different from the average of the light-directing values, of those portions of said bill which will direct light onto said light-sensitive element, to cause said light-sensitive element to experience a change in the intensity of the light thereon whenever a bill causes light to reach said light-sensitive element.



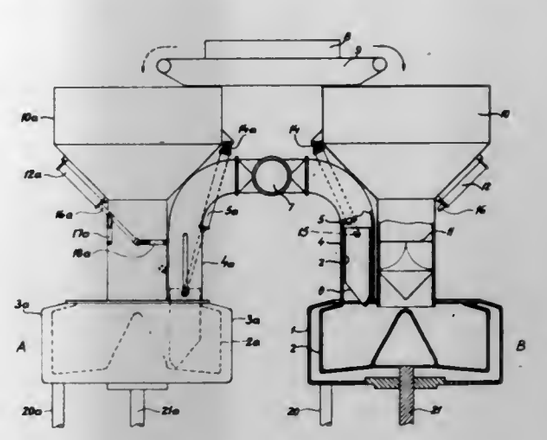
3,275,139
METHOD AND APPARATUS FOR ELECTROSTATIC SEPARATION OF FINE POWDERS
Charles Y. J. Bouteille, 156 Avenue de Chabeuil, Valence, Drome, France
Filed May 15, 1962, Ser. No. 194,850
Claims priority, application France, May 16, 1961, 861,950
6 Claims. (Cl. 209—129)

1. Apparatus for the electrostatic sorting of fine electrically conducting particles of the order of one micron and smaller in size, comprising an enclosure, means for evacuating said enclosure, a first electrode in said enclosure and being extended at its upper end by a ramp positioned to receive the particles to be sorted, a second electrode in said enclosure spaced from said first electrode, means for applying a voltage between said electrodes such that said first electrode is positive with respect to said second electrode, and means for collecting the sorted particles.

3,275,140
AIR SEPARATOR WITH FLUIDIZED DISCHARGE
Frits Rasmussen, Copenhagen-Valby, Denmark, assignor to F. L. Smidth & Co., New York, N.Y., a corporation of Delaware
Filed Apr. 11, 1963, Ser. No. 272,288
5 Claims. (Cl. 209—139)

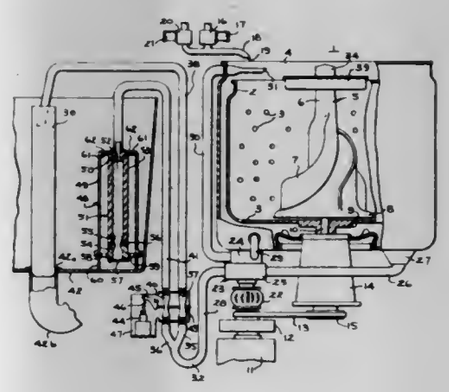
1. In an air separator of the closed circuit type for separating a finely divided material into coarse and fine fractions including a substantially closed casing, means in said casing defining concentric inner and outer chambers spaced from the top of said casing, said inner chamber for collecting the coarse fraction and said outer chamber for collecting the fine fraction, means for maintaining an air current flowing upwardly in the inner chamber and flowing downwardly in the outer chamber, means for introducing finely divided material into the inner chamber for entrainment of the fine fractions in the air stream for transfer to the outer chamber and collection of the coarse fractions in the inner chamber, an inner chamber outlet in said casing and outer chamber outlet in said casing, the improvement in combination therewith comprising means for maintaining the distance between the top of the casing and the chamber outlets

at a minimum, said means comprising an air pervious closure means for the bottom of one of the chambers inclined toward said one chamber outlet for diffusing air into the material above the closure to fluidize the material and cause it to flow over the closure to the outlet.



3,275,141
BENEFICIATION OF LANGBEINITE-CONTAINING MATERIALS
Albert Adams and Sam E. Tschappler, Carlsbad, N. Mex., and Hans U. Ziemer, Essen (Ruhr), Germany, assignors to International Minerals & Chemicals Corporation, a corporation of New York
Filed Jan. 31, 1964, Ser. No. 341,518
18 Claims. (Cl. 209—166)

1. A process for the benefication of a material containing discrete particles of minerals of the group consisting of langbeinite, leonite and schoenite, and discrete particles of gangue which comprises subjecting said mineral-containing material to froth flotation in the presence of an anionic flotation reagent in a brine containing potassium, sodium, magnesium, chloride and sulfate ions, said brine containing magnesium ions in the amount of about 0.5 to about 1.8% by weight, sulfate ions in the amount of 0.5 to about 5.0% by weight, and potassium ions (calculated as KCl) in the amount of about 1.8 to about 5.0% by weight, said brine being substantially saturated with respect to sodium chloride.

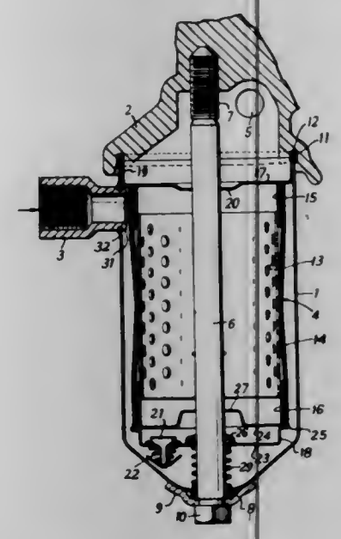


3,275,142
METHOD AND APPARATUS FOR EMPTYING AND FILLING CENTRIFUGES
Sven G. Ekegren, Uttran, and Per V. H. Bladh, Tullinge, Sweden, assignors to Aktiebolaget Separator, Stockholm, Sweden, a corporation of Sweden
Filed Aug. 15, 1963, Ser. No. 302,433
Claims priority, application Sweden, Aug. 27, 1962, 9,262/62
8 Claims. (Cl. 210—78)

1. In the centrifugation of a compressible fibrous material with the use of a centrifuge rotor and an exhaust pipe, the method which comprises filling the rotor with said material while accelerating the rotor to an operating speed for centrifuging said material, forming an annular body of centrifuged material in the outer part of the rotor, introducing said pipe into the rotor and in proximity to said

body while reducing the rotor speed, inducing a suction in said pipe whereby material is sucked from the rotating body by the pipe and discharged from the rotor, withdrawing said pipe from the rotor, and refilling the rotor with a new batch of said material while accelerating the rotor to said operating speed.

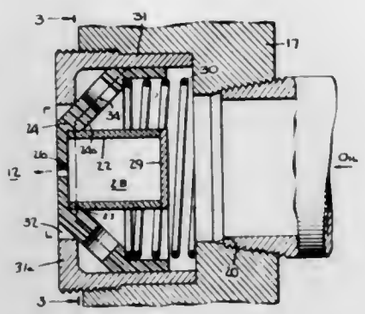
3,275,143
FILTER WITH CLEANING MEANS
John Bochan, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed Oct. 24, 1963, Ser. No. 318,571
7 Claims. (Cl. 210—120)



1. For use with a liquid re-use system; a filter assembly comprising:

(a) a hollow filter element forming a passage therethrough and having a porous wall effective to filter liquid passed therethrough from the outside to the inside of said filter element,

(b) said passage having a restricted portion adjacent one end thereof to cause a portion of the liquid flowing through said passage toward said one end to pass through said porous wall from the inside to the outside of said filter element to clean said filter element,



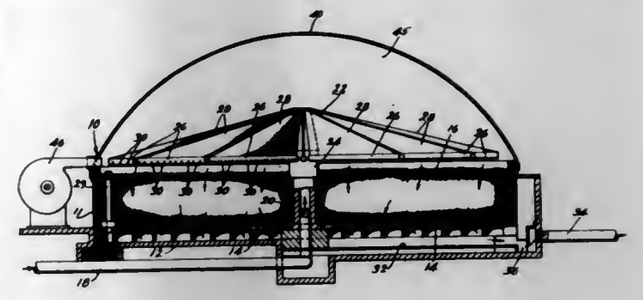
(c) and check valve means arranged to prevent flow in through said one end of said passage and to permit flow out through said one end, thereby requiring liquid passing into said filter element to pass through said porous wall.

3,275,144
FLUID FILTERS
Peter William Stripp, Plymouth, Devon, and Edwin Colin Spry, Plympton, Devon, England, assignors to Tecalemit (Engineering) Limited, Plymouth, Devon, England
Filed July 18, 1963, Ser. No. 296,069
Claims priority, application Great Britain, July 19, 1962, 27,917/62
1 Claim. (Cl. 210—130)

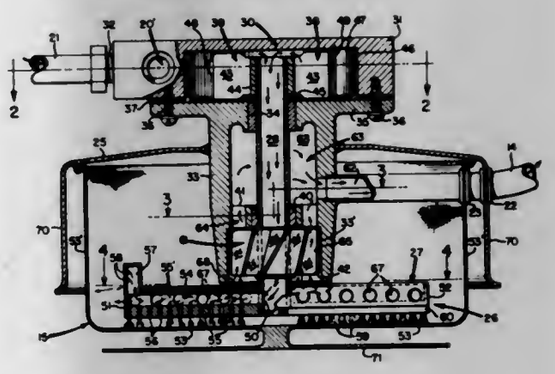
A fluid filter comprising: a body portion formed with a passage for the fluid being filtered; a cover having an open end which engages and forms a seal with said body portion; coupling means at said cover for connection to fluid being filtered and including an inlet boss fitted into a hole in said cover and a ring locking said boss to said cover, said coupling means being formed at least in part of a resilient material to allow limited angular movement of the inlet boss relative to said cover; an inner pressure member having a central opening; an outer pressure member; an annular filter element engaged between said pressure members; pressure means between said outer pressure member and said cover biasing said pressure members against said filter element so as to form fluid seals within the filter between said pressure means and said filter element such that fluid flowing between said coupling means and said passage passes through and is filtered by said filter element; a threaded stud passing through said cover, said pressure members, and said filter element, said stud being spaced apart from said filter element and said inner pressure member to define a passageway therebetween, said outer pressure member being formed on a top part and cup-shaped bottom part, one of said parts having edge portions bent over the edge of the other part to secure said parts together at their edges to define a hollow pressure member, said stud passing loosely through a central opening in said top part to define a passageway therebetween, said stud further passing through a central aperture in said bottom part, a sealing ring of elastomeric material between said bottom part and said stud, said pressure means loading said sealing ring to bias said sealing ring into sealing engagement with both said bottom part and said stud, said bottom part being provided with an aperture spaced from the first mentioned aperture to define a valve seat; and a normally closed pressure relief valve of the mushroom type mounted on said bottom part including a valve member adapted to seat against said valve seat, a stem extending through said second mentioned aperture out of said hollow pressure member, a retaining member carried by said stem at its end opposite said valve member and a helical coil spring interposed between said retaining member and said bottom part biasing said valve closed and adapted to open when the pressure difference between the fluid entering and the fluid leaving said filter exceeds a predetermined value to allow fluid to bypass the said filter element.

3,275,145
FILTER FOR CHECK VALVE
Alphonse A. Jacobellis, Huntington Station, N.Y., assignor to Security National Bank of Long Island, Huntington, N.Y., a national banking association
Filed Dec. 17, 1962, Ser. No. 245,210
2 Claims. (Cl. 210—136)

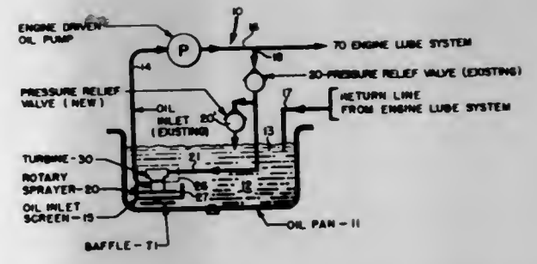
1. A filter assembly comprising:
(a) a housing having a front wall, a front opening in said front wall and a rear opening,
(b) a valve slidably mounted in said housing, said valve having (1) a front wall with an orifice therethrough, (2) an annular angled wall extending rearwardly and outwardly from said front wall of said valve, and (3) a side wall in sliding sealing relationship with said housing; said valve being in normal sealing relationship with said front opening of said housing, said angled wall of said valve including openings therethrough rearward of the sealing point between said valve and said front opening of said housing, said orifice in said front wall of said valve being in communication with the environment in front of said front opening of said housing when said valve is in said normal sealing relationship with said front opening of said housing,
(c) bias means for holding said valve in normal sealing relationship with said front opening of said housing, whereby (1) when said valve is in said normal sealing relationship with said front opening of said housing, said orifice is the only passage from the environment in front of said front opening of said housing through said valve; and (2) when said valve is opened, said orifice and said openings in said angled wall are the only passageways from the environment in front of said front opening of said housing through said valve, and
(d) an enclosure mounted on the rearwardly facing side of said front wall of said valve so that said orifice provides communication between the interior of said enclosure and the environment forward of said front wall of said valve, said enclosure having an annular wall portion concentric with said annular angled wall of said valve,
(e) a portion of said annular wall portion of said enclosure constituting a filter element, said filter element and said orifice constituting the sole means for fluid to flow into or out of said enclosure,
whereby the forward flow of fluid (from the rear to the front of said housing) will pass through said filter element into said enclosure and out said orifice into the environment in front of said front wall of said housing, and whereby the rearward flow of fluid will overcome said bias means to open said valve so that fluid will flow through said openings in said angled wall of said filter to impinge against the outer walls of said filter element thereby washing away whatever particles said filter element has separated from the forwardly flowing fluid.



3,275,146
LAUNDRY MACHINE WITH IMPROVED BALANCING MECHANISM
Glen R. Severance, Benton Harbor, and Keith D. Salisbury, St. Joseph, Mich., assignors to Whirlpool Corporation, Benton Harbor, Mich., a corporation of Delaware
Filed May 1, 1964, Ser. No. 364,114
17 Claims. (Cl. 210—144)



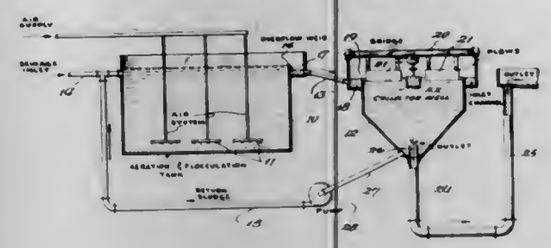
1. Laundry apparatus including a support, a rotary basket drum and means mounting the drum on the support providing for limited oscillating deflections of the drum relative to the support toward opposite sides of a center line transversely through the axis of rotation of the drum in response to acentric loads in the rotating drum,
means for counterbalancing the acentric loads mounted to oscillate with the drum,
and means for automatically controlling the balancing means comprising a pinion mounted to oscillate about its own axis and also to oscillate with the acentric loading oscillations of the drum and a rack member mounted on a stationary portion of said support and meshing with the pinion to effect oscillations of the pinion about its own axis during oscillation movements of the pinion with the drum.



3,275,147
FILTERS
Louis Charles Gilde, Pennsauken, N.J., assignor to Campbell Soup Company, Camden, N.J., a corporation of New Jersey
Filed July 14, 1964, Ser. No. 382,525
1 Claim. (Cl. 210—150)

A filter for waste fluid material comprising a bed of filter material, means for distributing fluid waste material over the top surface of said bed of filter material, a flexible cover overlying and completely closing the top surface of said bed of filter material, a blower communicating with the space between the cover and the top surface of the filter bed for maintaining air above atmospheric pressure in the space between said cover and the bed of filter material, and a trap for separately discharging filtered waste fluid and air from below the filter bed.

3,275,148
ANTI CLOG DEVICE FOR LUBRICATING SYSTEM
Lawrence Vicino, 415 5th St., Gilroy, Calif.
Filed Oct. 7, 1963, Ser. No. 314,323
5 Claims. (Cl. 210—168)

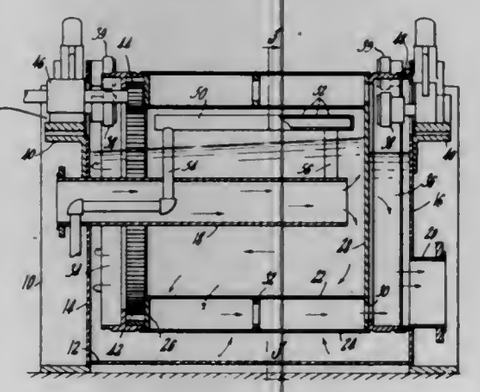


1. In combination with the oil pressure system of an internal combustion engine having an oil inlet screen submerged in its crank case oil sump and confining the open end of an oil inlet conduit going to the oil pump of such oil pressure system for drawing oil under vacuum from said oil inlet screen, a turbine housing confined within said oil inlet screen having an open inlet end for receiving oil therefrom and a discharge end communicating with the open end of said oil inlet conduit, a turbine wheel in said turbine housing between its open inlet end and its discharge end, a shaft secured to said turbine wheel and extending into said oil inlet screen, a sweep arm secured to said shaft within said oil inlet screen for turning movement therein and having a pair of diametrically opposed hollow blades each having oil inlet apertures at their leading edges for scooping oil into said hollow blades, said hollow blades having an opening therein adjacent the open inlet end of said turbine housing for discharging the oil scooped into said blades into the open inlet end of said turbine housing and past said turbine wheel and toward the discharge end of said turbine housing and into said oil inlet conduit.

3,275,149
APPARATUS FOR SEWAGE PRETREATMENT FOR OUTFALL DISPOSAL

Harvey F. Ludwig and Russell G. Ludwig, Arcadia, Calif., assignors to FMC Corporation, a corporation of Delaware

Filed Dec. 5, 1963, Ser. No. 328,258
3 Claims. (Cl. 210—195)



1. Apparatus for treatment of sewage for outfall disposal which comprises a holder for a mass of sewage matter, air dispersing means positioned below the normal liquid level in said holder, a conduit for introducing influent sewage into said holder, a skimming tank of inverted truncated cone configuration spaced exteriorly of said holder, a peripheral influent channel at the top of said conical skimming tank, conduit means interconnecting said holder and said peripheral channel for movement of aerated sewage from said holder to said peripheral channel, means for flowing aerated sewage from said channel into said skimming tank, means for removing floatables from the surface of the aerated sewage in said skimming tank, conduit means communicating with the small end of said conical skimming tank for withdrawing and disposing of a suspension of solids therefrom and means for returning a portion of the suspension of solids from said skimming tank to a zone of mixing with influent sewage being introduced in said holder.

3,275,150
INTERNALLY FED DRUM FILTER

Ross A. Tait, Dorval, Quebec, Canada, assignor to Sherbrooke Machineries Limited, Montreal, Quebec, Canada, a corporation of Canada

Continuation of application Ser. No. 256,173, Feb. 4, 1963. This application Oct. 12, 1965, Ser. No. 500,478
11 Claims. (Cl. 210—327)

1. In a decker of the type having a vat for containing pulp stock,

a drum rotatable within said vat adapted to collect filtered stock thereon as it rotates, and

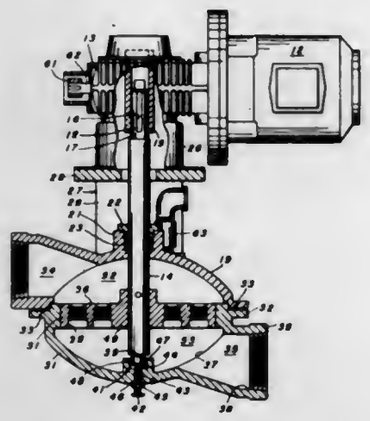
means for rotating said drum within said vat,

said drum comprising

an outer cylindrical filter screen,

an inner cylindrical filter screen within and concentric with said outer filter screen, and

means supporting said inner and outer filter screens in spaced relation to provide an annular open space therebetween,



first fluid carrying means communicating with a source of pulp stock external to said vat and extending within said inner filter screen for supplying pulp stock to the inner surface thereof such that said pulp stock is partially thickened by said inner filter screen as said drum rotates, and

second fluid carrying means communicating the inner surface of said inner filter screen with the outer surface of said outer filter screen for conveying partially thickened pulp stock from the former and against the latter as said drum rotates such that filtered stock is collected upon the outer surface of said outer filter screen.

3,275,151
DISC-TYPE STRAINER

Hugh B. Carr, Carnegie, Pa., assignor to S. P. Kinney Engineering, Inc., Carnegie, Pa., a corporation of Pennsylvania

Continuation of application Ser. No. 154,570, Nov. 24, 1961. This application July 19, 1965, Ser. No. 482,014
1 Claim. (Cl. 210—333)

A rotary disc-type strainer comprising:

(a) a body formed of two hollow concavo-convex dome-shaped sections arranged with their concave faces in confronting relation and having confronting peripheral flanges secured together in water-tight contact, said sections defining an interior of generally elliptical shape in vertical section,

(b) a shaft supported by said body having its axis conicident with an axis passing through the centers of said dome-shaped sections,

said shaft having one end thereof extending through the center of one section, said one section having a packing gland at its center through which the shaft extends and beyond which the shaft projects,

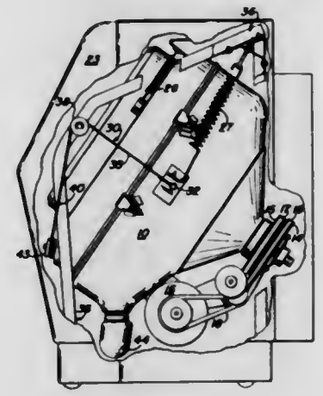
(c) means on the projecting end of the shaft for rotating said shaft,

(d) means providing a thrust bearing for the shaft at the center of the other section and being accessible from the exterior of said other section for adjusting the shaft in an axial direction,

(e) a strainer disc with straining media therein secured to said shaft in the plane of the confronting flanges of the sections and the long axis of the elliptical interior of the body,

(f) one of said sections having a ring portion surrounding the disc and having a substantially sliding fit with the periphery of the disc,

(g) one of said dome-shaped sections having an inlet pipe connection projecting therefrom parallel with the plane of the disc and terminating in an elliptical inlet port immediately above the disc, said elliptical port having its long axis parallel with the surface of the disc, the top of the port, due to the curvature of the dome, being closer to the center of said dome-shaped section than the peripheral flange thereof, the port in the direction of its shorter elliptical axis defining an arc extending the greater portion of the total distance from the peripheral flange of the section to the center of the section,



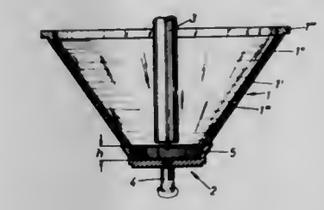
(h) said inlet pipe connection being integral with said one section and extending diametrically outward from said port, said shorter axis increasing in dimension and said long axis decreasing in dimension in the direction away from said port until said pipe is circular,

(i) the other section having an outlet port and connection similar to the inlet port and connection but located diametrically opposite the inlet port and connection, a fixed backwash enclosure on said section having the inlet pipe thereon, said enclosure terminating in an end surface parallel with the surface of the disc toward which it is directed and close to which it terminates, said enclosure having a backwash outlet passage extending through the dome-shaped section in a direction normal to the plane of the disc, said means for adjusting the shaft in an axial direction enabling the disc to be moved toward and away from the end surface of said backwash enclosure.

3,275,152
SUSPENSION SYSTEM FOR CENTRIFUGAL EXTRACTORS

Walter W. R. Searle, Beaconsfield, England, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Filed Mar. 5, 1964, Ser. No. 350,147
Claims priority, application Great Britain, Jan. 19, 1960, 1,993/60
13 Claims. (Cl. 210—364)

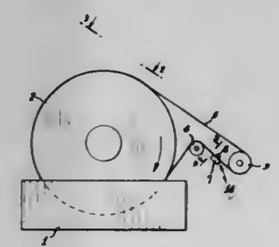


1. A centrifugal extractor comprising; a first structure defining a supporting framework, a second structure including a non-rotary tub, a spin basket having a longitudinal axis, said basket being mounted for rotation in said tub about said axis, a suspension system mounting said second structure on said first structure with said axis of said spin basket inclined to the vertical, said suspension system including resilient means attached to said first and second structures and applying an upward force to said second structure in a direction substantially perpendicular to said axis of said spin basket, said suspension system further including differential supporting means movably attaching said second structure to said first structure for limited relative movement of said second structure with respect to said first structure in any direction except axially rearward, the movement of said second structure when said spin basket is rotating being such that any point on said axis of said spin basket substantially generates a circle, said differential supporting means being secured to said first structure by attaching means, said attaching means lying in a reference plane which is substantially perpendicular to the said axis of said spin basket and spaced from said second structure in a direction axially of said axis of said basket, said axis intersecting said plane at a point, said differential supporting means providing a supporting force which always acts substantially through said point under all normal conditions of use of said extractor.

3,275,153
SIEVE-CENTRIFUGE

Wolfram Hirsch, Monheim, Rhineland, Germany, assignor to Hein, Lehmann & Co. A.G., Dusseldorf, Germany, a firm of Germany

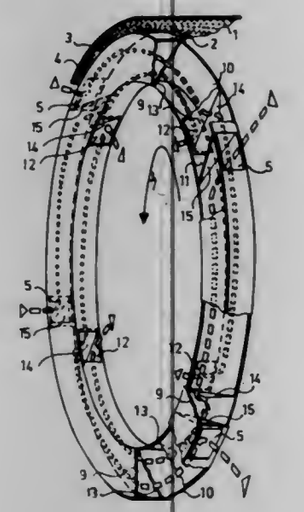
Filed Oct. 17, 1963, Ser. No. 316,930
4 Claims. (Cl. 210—369)



1. A sieve-centrifuge, particularly for viscous sugar masses, comprising in combination with a rotary frustoconical sieve drum having a narrower lower end and means directed toward said lower end for supplying the mass to be centrifuged; an accelerator pot located at said lower end and rotating along with the drum, the inner side and bottom surfaces of said accelerator pot being roughened and non-perforated and consisting of ribs extending concentrically to the axis of the drum and grooves between said ribs to impart increased frictional and entraining action to masses moving upon said inner and bottom surfaces.

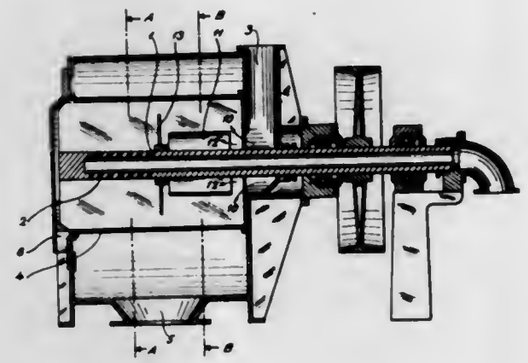
3,275,154
COMB FOR STRING TYPE VACUUM FILTER

Samuel D. Fritz, New York, N.Y., assignor to Engelhard Industries, Inc., Newark, N.J., a corporation of Delaware



Filed July 19, 1965, Ser. No. 472,830
2 Claims. (Cl. 210—386)

1. In a continuous rotary drum filter of the type comprising in spaced parallel relationship a vacuum drum and a discharge roll and having a plurality of parallel endless strings composed of a synthetic resin material passing over the drum and roll, the strings being spaced from each other axially of and passing over the drum and roll, a string aligning comb having an elongated body portion with a plurality of fingers spaced laterally of each other longitudinally of the body portion and extending in a common direction, sleeve members co-

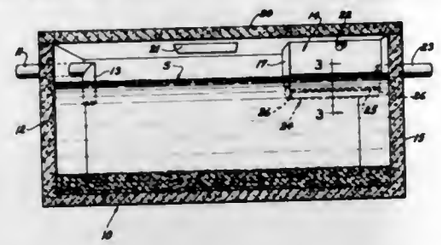


axially mounted on the fingers, the sleeve members being composed of a synthetic resin material resistant to abrasion by said strings, the body portion and fingers being composed of a stiff and rigid material different from that of the sleeve members and being capable of withstanding relatively high temperature operating conditions, the comb being positioned in parallel relationship with the discharge roll and positioned to receive between each pair of adjacent sleeves an endless string passing over the discharge roll.

3,275,155
ROTARY SUCTION FILTER DRUM
Lars Erik Karl Axel Tell, Karlstad, Sweden, assignor to Aktiebolaget Karlstads Mekaniska Werkstad, Karlstad, Sweden, a Swedish company
Filed Dec. 8, 1965, Ser. No. 512,425
Claims priority, application Sweden, Dec. 14, 1964, 15,124/64
7 Claims. (Cl. 210—404)

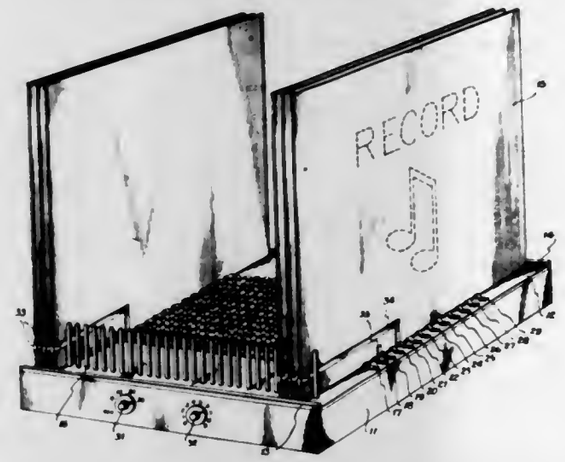
1. A rotary suction filter drum comprising an outer cylindrical, perforated casing, an inner cylindrical casing spaced from said outer casing, a plurality of axially extending walls in the space between said outer and inner casings dividing said space into a plurality of axially extending cells, at least one opening in said inner casing from each one of said cells, and a discharge duct extending from each one of said openings circumferentially along the inner surface of said inner casing rearwardly with respect to the direction of rotation of the drum, said discharge ducts being divided into several groups axially disposed side by side in the drum, each one of said groups comprising an even number not smaller than four of discharge ducts disposed in one and the same plane perpendicular to the axis of the drum and having their associated openings in said inner casing evenly spaced around the circumference of said inner casing, each discharge duct in each one of said groups extending from its associated opening in said inner casing opposite to the direction of rotation of the drum past the first subsequent opening in said inner casing associated with the same group of discharge ducts not to open into the interior of the drum until adjacent the next subsequent opening in said inner casing associated with the same group of discharge ducts, whereby each discharge duct is over its first portion from its associated opening in said inner casing to the first subsequent opening in said inner casing running immediately close to the inner surface of said inner casing and over its remaining portion to its opening into the interior of the drum running somewhat radially spaced from said inner casing and having another discharge duct belonging to the same group of discharge ducts running between it and the inner surface of said inner casing.

3,275,156
STRAINER OF THE CENTRIFUGAL TYPE
Seppo Olavi Valtanen, Olli Juhani Punttila, and Ulf Viking Sjölund, all of Karhula, Finland, assignors to A. Ahlström Osakeyhtiö, Karhula, Finland, a company of Finland
Filed Dec. 23, 1963, Ser. No. 332,575
4 Claims. (Cl. 210—415)



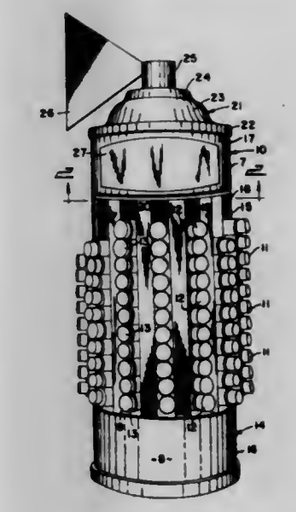
1. A strainer of the centrifugal type adapted for the further alluviation of fibers such as cellulose pulps, comprising an elongated cylindrical perforated strainer drum, a rotatable hollow rotor shaft having a bore therein mounted coaxially of the strainer drum, means to rotate said shaft, means to admit a liquid suspension of fibers into the bore in the hollow rotor shaft, said rotor shaft having a plurality of holes through the wall thereof, a plurality of generally radially extending blades affixed to the rotor shaft to rotate therewith within the strainer, said blades being so disposed on the shaft that the holes in the wall of the shaft lie close to and in advance of the forward faces of the respective blades which lead in the direction of rotation of the rotor shaft and blades, and a paddle mounted on the radially outer end of each of the blades, the paddles forming general prolongations of the respective blades and having their outer ends closely confronting but spaced somewhat from the inner surface of the strainer drum, the paddles and blades at the zone of connection therebetween presenting openings therethrough whereby said liquid suspension is caused by centrifugal force to flow along the forward faces of the blades, out through said openings at the connections between the outer ends of the blades and the paddles, and into contact with fibers collected on the inner surface of the strainer, in order further to alluviate such collected fibers.

3,275,157
OUTLET DEVICE FOR WASTE PITS, SEPTIC TANKS AND THE LIKE
Denver J. Stamps, 324 Woods Mill Road, Manchester, Mo.
Filed Sept. 26, 1963, Ser. No. 311,842
5 Claims. (Cl. 210—521)



2. In outlet means for a septic tank, a housing in said tank having opposed side and end walls and at least one bottom wall directed angularly relative to said other walls, said bottom wall having a lower edge spaced from said other walls to form an opening into said housing, an outlet conduit leading from said housing above said opening, and a solids diverter member mounted in said opening and having a first surface in spaced relation with said lower edge of said bottom wall and extending into said opening

to form a slot, and said member having a second surface spaced from said slot and directed at an angle to said first



surface said second surface extending laterally outwardly beyond said lower edge of said bottom wall to divert solids from said opening into said housing.

3,275,158
ENVELOPE CONTAINER STORAGE DEVICE
Ronald Glass, Washington, D.C., and Raymond Andrel, Vienna, and Albertis S. Harrison III, Fairfax County, Va., assignors to Keltec Industries Inc., a corporation of Virginia
Filed Sept. 22, 1964, Ser. No. 398,245
7 Claims. (Cl. 211—40)

1. An envelope container storage means for storing a plurality of relatively flat envelopes having at least one substantially uniform edge comprising a support surface, means for supporting said envelopes on said surface on said uniform edge in juxta position, means for positioning said envelopes in a uniform manner with respect a reference line on said surface, at least first and second pluralities of conductive strips each strip in said pluralities electrically isolated one from the other and disposed in a common relation at substantially all points thereon with respect said reference line and at respective distances therefrom, an electrical energy source having two output terminals, first and second switch means having a plurality of switch selection terminals, each of said switch means being electrically connected to respective output terminals of said electrical energy source, and adapted to interconnect said respective output terminal and any one of said plurality of switch selection terminals; means electrically connecting each of said switch selection terminals in said first switch means to a respective conductive strip in said first plurality thereof; means electrically connecting each of said switch selection terminals in said second switch means to a respective conductive strip in said second plurality thereof; two terminal indicator means adapted for electrical energization, first metallic interconnection means affixed to said envelope and disposed thereon to interconnect a respective terminal of said indicator means and one selected conductor in said first plurality thereof when said envelope is positioned in said uniform manner, and second metallic interconnection means affixed to said envelope and disposed thereon to interconnect a respective terminal of said indicator means and one selected conductive strip in said second plurality thereof when said envelope is positioned in said uniform manner.

3,275,159
DISPLAY DEVICE
William A. James, Bay Village, and John J. Wallace, Cleveland, Ohio, assignors to The Sherwin Williams Company, a corporation of Ohio
Filed Jan. 15, 1965, Ser. No. 425,756
3 Claims. (Cl. 211—49)

1. A device having the configuration of a conventionally designed pressurized spray container for displaying and storing containers, comprising in combination:

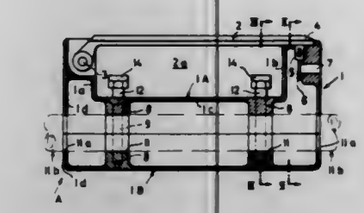
(a) a body portion including:

(1) a cylindrical portion disposed intermediate the ends of the body portion and mounted for rotation about its own longitudinal axis, a section of the cylindrical portion taken in a plane normal to its said longitudinal axis including:

(i) a plurality of circumferentially spaced recesses extending radially into the cylindrical body, each recess being formed between a pair of opposing planar wall surfaces;

(ii) the recesses being substantially coextensive with said cylindrical portion and parallel to its said longitudinal axis;

(b) a top portion for covering the body portion, comprising stepped cylindrical portions of succeeding smaller diameters, the uppermost cylindrical portion configured to represent a spray nozzle;



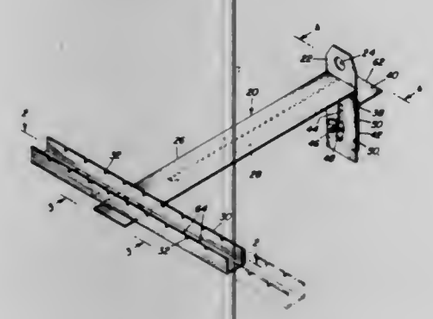
(c) a triangularly shaped display panel secured to, and extending from the spray nozzle portion of said top portion, the display panel designed to receive and display advertising indicia; and

(d) means for mounting the cylindrical portion for rotation about its own longitudinal axis.

3,275,160
CLAMPING DEVICE FOR SKIS
Walter Zürker, 33 Zugspitzstrasse, Garmisch-Partenkirchen, Germany
Filed Apr. 21, 1964, Ser. No. 361,390
Claims priority, application Germany, Apr. 26, 1963, Z 10,081; July 9, 1963, Z 10,216; Aug. 8, 1963, Z 10,286; Dec. 21, 1963, Z 10,545
29 Claims. (Cl. 211—60)

1. A clamping device for skis, comprising a base member; fastener means located in said base member for detachably securing said base member to a support struc-

ture; a cover member attached to and movable with reference to said base member between a first position in which said members define between themselves at least one passage for reception of a ski in such a way that a portion of the ski is surrounded by said members, and a second position in which the ski may be withdrawn from



said passage; adapter means being adapted to be moved to a position in said passage for changing the effective cross-sectional area of said passage so that in dependence on the position of said adapter means said passage may accommodate portions of one or more skis; and a locking device arranged to positively lock said members to each other in the first position of said cover member.

3,275,161
CLOTHES RACK FOR AN AUTOMOBILE

Gordon W. Robertson, 1057 Bonita Drive, Encinitas, Calif.

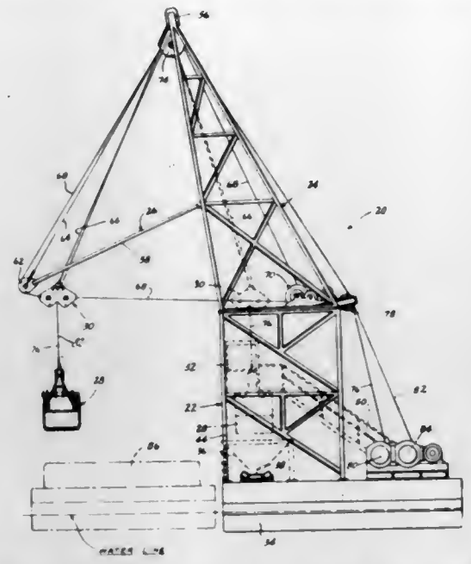
Filed Nov. 6, 1964, Ser. No. 409,518
2 Claims. (Cl. 211—87)

1. A clothes rack adapted to be hung from a standard hook in an automobile comprising:

(A) A vertically extending plate having a hole for receiving a hook;

(B) a horizontally extending arm having an end stationarily fixed to and extending from one side of the plate and below said hole;

(C) a horizontally extending stabilizing arm extending from the opposite side of the plate and in a lower plane than the first mentioned arm;



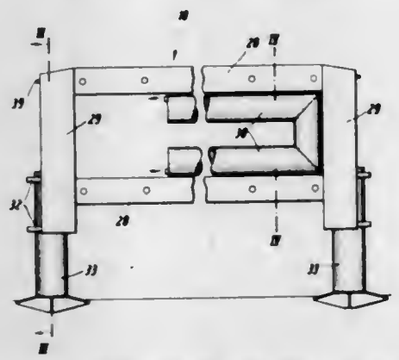
(D) and fastening means, adjustable vertically relative to the plate, for securing the stabilizing arm to the plate.

3,275,162
TOWER CRANE WITH LOADING BOOM

Linder Deimund, 403 N. Main St.; Linder P. Deimund, Rte. 1, Box 310; and Richard N. Deimund, 227 N. Middle, all of Cape Girardeau, Mo.

Filed June 28, 1965, Ser. No. 467,293
7 Claims. (Cl. 212—76)

1. A crane comprising a tower, a boom supported from said tower and extending over a crane loading area, and means for moving a clamshell bucket from the end of said boom through an opening in the interior of said tower to an unloading area, said means comprising a tandem sheave and bucket holding and closing lines connected to the bucket and passing through the tandem sheave and over sheave means at the top of the tower



to separate hoist means for the holding and closing lines, and said tandem sheave being suspended from the top of the tower by a suspension line.

3,275,163
HYDRAULICALLY OPERATED DEEP DREDGER SHOVEL FOR MOUNTING ON SUPPORT VEHICLES

Hans Schaeff, Langenburg, Wurttemberg, Germany, assignor to Firma Karl Schaeff KG., Maschinenfabrik, Langenburg, Wurttemberg, Germany

Filed Dec. 16, 1964, Ser. No. 418,739
Claims priority, application Germany, Dec. 18, 1963, Sch 34,344, Sch 34,345
5 Claims. (Cl. 212—145)

1. A hydraulic deep bucket dredger for attachment to a carrier vehicle comprising:

(a) a frame adapted to be attached to the carrier vehicle,

(b) lateral, downwardly extending support legs,

(c) a slide carriage transversely slidable on said frame,

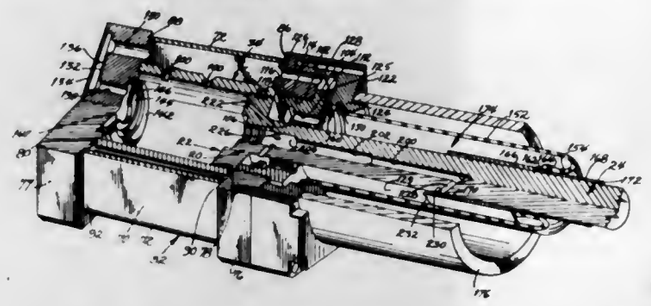
(d) said frame including an upper and a lower horizontal hollow member, and a pair of substantially vertical members,

(e) said frame having at least one hook on said upper member and a connecting shaft on said lower member for attachment to the carrier vehicle,

(f) an oil container positioned in said frame,

(g) said support legs including hydraulic cylinders positioned and slidably mounted in said vertical members,

(h) said hydraulic cylinders including piston rods secured to said vertical members and held against axial movement,



(i) said slidable carriage having a pivoting plate and a pivot drive mounted thereon, said pivot drive connected to said pivoting plate for rotation thereof,

(j) a boom operatively connected to said pivot plate.

3,275,164
HYDRAULIC DRAFT GEAR ARRANGEMENT

William H. Peterson, Homewood, Ill., assignor to Pullman Incorporated, Chicago, Ill., a corporation of Delaware

Continuation of application Ser. No. 439,630, Mar. 15, 1965. This application Feb. 2, 1966, Ser. No. 533,751
9 Claims. (Cl. 213—43)

1. A hydraulic cushioning device for draft gear or the like and operative to cushion buff and draft impacts comprising:

a housing,

a cylinder mounted in said housing,

a piston member reciprocably mounted in said cylinder,

said piston member comprising a piston head positioned in said cylinder and a piston rod projecting outwardly of said cylinder,

said piston head including a high pressure generating side upon buff impact to said cushion device,

said piston head and rod being a one piece piston member,

means for effecting a hydraulic liquid seal between said rod and said housing,

pressure relief valve means carried by said piston member,

said relief valve means comprising:

a bore formed in said rod and extending longitudinally thereof and inwardly of the head end thereof,

a valve member reciprocably mounted in said bore and proportioned to substantially complement the width of said bore,

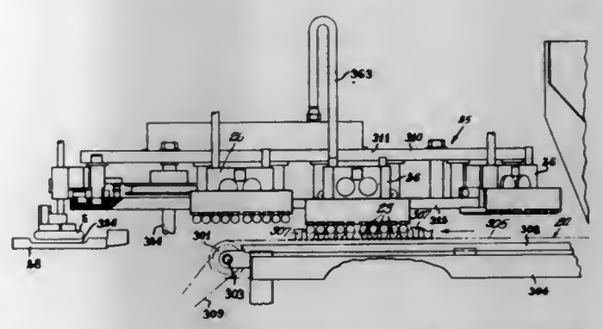
resilient means biasing said valve member outwardly of said bore,

stop means for limiting the movement of said member outwardly of said bore,

and an actuator member shiftably mounted in said head and having one end thereof operably engaging said valve member and the other end thereof exposed at said high pressure side of said piston head,

said resilient means being prestressed to position said valve member at predetermined positions,

said piston head being formed with conduit means extending between said high pressure side thereof and the position of said valve member when in its said predetermined position,



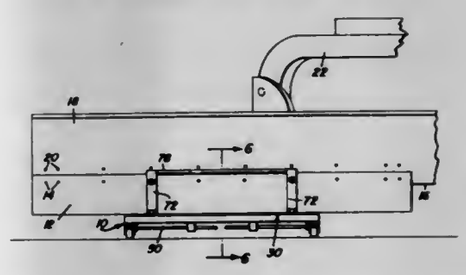
and accumulator means operably connected with said bore inwardly of said relief valve means,

said actuator member shifting said valve member against the action of said resilient means to place said piston head conduit means into communication with said accumulator means when said piston head high pressure side is subjected to pressures above a predetermined maximum.

3,275,165
TRANSFER MECHANISM FOR SMALL ELONGATE ARTICLES

Andrew H. Vedvik, Madison, Wis., assignor to Oscar Mayer & Co., Inc., Chicago, Ill., a corporation of Illinois

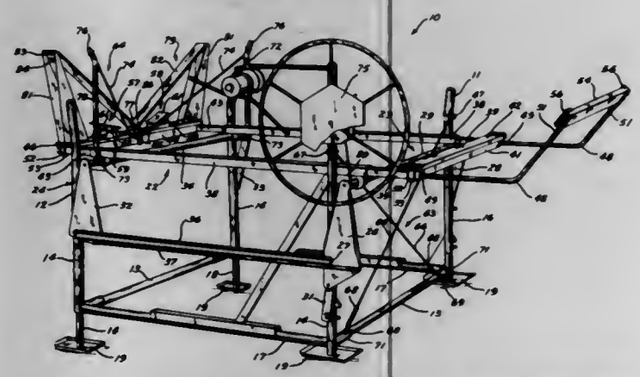
Original application Jan. 29, 1963, Ser. No. 254,745, now Patent No. 3,217,766, dated Nov. 16, 1965. Divided and this application July 20, 1965, Ser. No. 473,447
6 Claims. (Cl. 214—1)



1. Apparatus for transferring groups of elongate articles having the form of small sausages from a supply conveyor to a discharge station which comprises a supporting frame including vertically spaced plates of generally triangular shape arranged one above the other, a conveyor chain mounted on supporting sprockets which are disposed in a triangle and in a common plane with the sprockets mounted on shafts which are parallel and normal to the plane of the bottom frame plate, a plurality of pick-up heads pivotally connected to said conveyor chain and having a portion thereof extending outboard of the perimeter of said supporting frame, spaced cam rollers on said heads received in cam tracks in said frame plates for guiding the heads in a generally triangular path extending at one side of the supporting frame above a supply conveyor on which the articles are arranged in single line, side-by-side relation, each of said heads having an article pick-up member mounted on the bottom thereof so that it is movable in a path which is normal to the path of movement of the head, and means for applying suction to the pick-up member so as to pick up successive groups of articles and transport said articles to a discharge station along an adjoining side of said supporting frame.

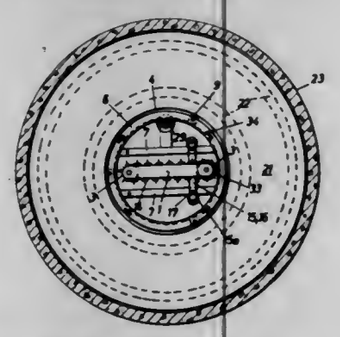
3,275,166
BLADE CHANGER DOLLY

Nile Shannon, Carnarvon, Iowa



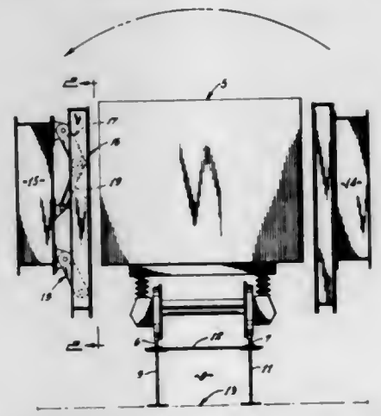
Filed Dec. 31, 1963, Ser. No. 334,872
8 Claims. (Cl. 214—1)

1. A dolly for supporting and adjustably positioning the blade of a scraper moldboard comprising a wheeled support frame consisting of rigidly connected side and end members enclosing a central opening, a pair of vertically swingable lift arms slidably mounted on said frame and manually operable through said opening, abutment members on said arms, a platform comprising rigidly connected side and end members enclosing an opening, means guidingly securing said platform to said frame including pins on said platform loosely and slidably received in



sockets on said frame, said platform being of equal width but lesser length than said frame with said openings in registration, a U-shaped carriage mounted upon said platform and having laterally projecting pegs for engagement in bolt holes in a scraper moldboard blade to support the latter, fulcrum brackets rising from the end members of said platform adjacent one end of said end members, the arms of said U-shaped carriage being pivoted each to one of said fulcrum brackets for vertical tilting of said carriage about a horizontal axis, said end members of said platform overlying said abutment members for lifting of said carriage and platform when said lift arms are lifted upwardly.

3,275,167
BOAT CENTERING AND STOP APPARATUS
Byron L. Godbersen, Ida Grove, Iowa
Filed July 15, 1964, Ser. No. 382,889
5 Claims. (Cl. 214—1)

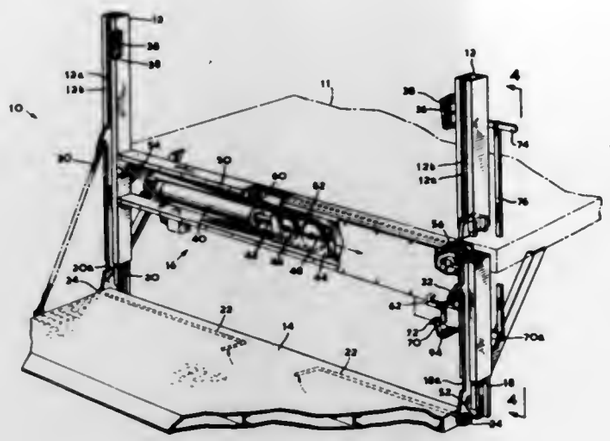


1. A portable boat hoist comprising in combination:
ground engageable frame means;
boat engageable means including a relatively flat platform, said platform having longitudinally extensible end members; and
means adjustably connected to one paid of said end members and movable longitudinally thereof, said means adapted to engage the prow of a docking boat and to simultaneously stop and slightly lift same with the transom thereof placed over the other pair of extensible ends said transom engageable with said other pair of extensible ends to aid stopping the boat in response to said slightly lifted prow movement.

3,275,168
DEVICES FOR REMOVING STORED MATERIAL FROM SILOS
Josef Schleich, Eichendorffstrasse 3, Ansbach, Germany
Filed Sept. 24, 1964, Ser. No. 398,869
Claims priority, application Germany, Sept. 24, 1963, Sch 33,910
17 Claims. (Cl. 214—17)

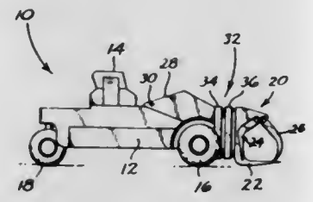
1. In a silo having a cylindrical outer wall and an annular base with a central opening, a device for removing stored material from said silo, said device comprising a circular member extending through said opening, means to mount said member for rotation within and respect to said opening, a pair of parallel beams extending across said member, a support member mounted on said beams for longitudinal sliding movement with respect thereto, and a milling arm carried by said support member and adapted to extend to the outer wall of said silo upon said support member being moved to a predetermined position with respect to said beams.

3,275,169
ROTARY RAILROAD CAR DUMPER
Raymond H. Sabin and Edward E. Cheek, Cleveland, Ohio, assignors to McDowell-Wellman Engineering Company, a corporation of Ohio
Continuation of application Ser. No. 349,306, Mar. 4, 1964. This application Oct. 13, 1965, Ser. No. 511,263
5 Claims. (Cl. 214—55)



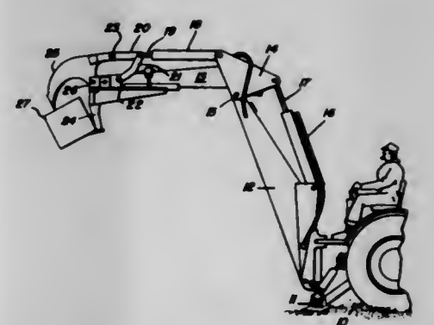
1. In a rotary railroad car dumper having a fixed dumper side wall, a trackway extending through the dumper and immovable relative to the fixed dumper side wall, means for clamping a railroad car on the trackway, and means for rotating the dumper, the improvement which comprises:
(a) a movable wall in the dumper for engaging an adjacent side wall of a railroad car positioned in the dumper to support the car as it is rotated;
(b) means for mounting the movable wall on said fixed dumper side wall such that the wall moves parallelogrammatically towards and away from said railroad car side wall, said means including at least one pair of parallel spaced link arms mounted for rotating in planes normal to the longitudinal axis of the trackway, said link arms being rotatably mounted on said fixed dumper side wall in linear spaced relation from each other and the trackway when measured in a plane normal to the plane of the trackway; and
(c) means coupled with at least one of the link arms for rotating the link arms and holding them in a plurality of positions, whereby the movable wall is parallelogrammatically moved into and out of engagement with the railroad car side wall and held thereagainst in supporting relation to the car as it is rotated, the weight of said car and movable wall being transferred to said dumper through said link arms.

3,275,170
HYDRAULIC LOADING DEVICES
Allister S. MacRae, Leaside, Ontario, and John C. Martin, Toronto, Ontario, Canada, assignors to Diesel Equipment Limited, Toronto, Ontario, Canada
Filed Oct. 5, 1964, Ser. No. 401,539
18 Claims. (Cl. 214—75)



1. A hydraulic lifting apparatus for attachment to a raised floor comprising a pair of spaced apart vertical post members fixed to said floor, a pair of slide members

carried by and adapted to slide vertically relative to said posts, a platform extending between and pivotally attached to the lower ends of said slide members whereby said platform may be pivoted from a first substantially horizontal position to a second substantially vertical position, and vice versa, a hydraulic ram, flexible linkage

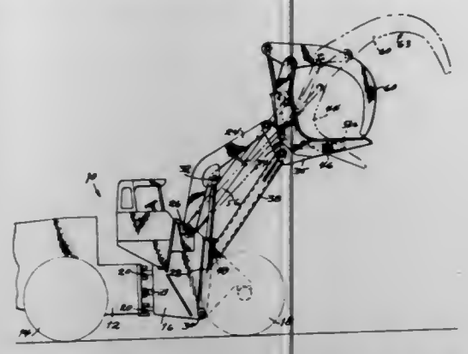


means extending from said ram to said slide members whereby actuation of said ram raises and lowers said platform, and means for releasably securing said platform in said second substantially vertical position in such manner that said platform may be secured in said vertical position during raising and lowering of said platform.

3,275,171
VEHICLE WITH SWINGABLE LOAD-SUPPORTING STRUCTURE
Richard C. Shore, Portland, Oreg., assignor of fifty percent to Scott S. Corbett, Jr., Portland, Oreg.
Filed May 19, 1964, Ser. No. 368,675
1 Claim. (Cl. 214—131)

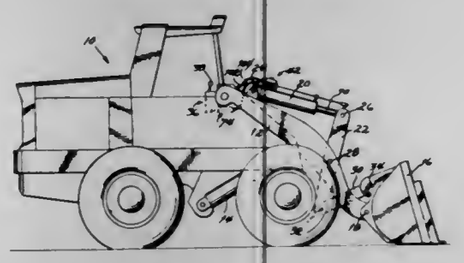
In a vehicle,
a vehicle frame and a boom pivoted at one end on said frame, load-supporting means disposed at the end of said boom opposite its said one end,
a pair of hinge mechanisms adjacent opposite sides of the boom connecting the boom and load-supporting means and permitting the load-supporting means to be pivoted selectively about transversely spaced vertical axes,
each of said hinge mechanisms including pin means that may be shifted so as to break down the hinge mechanism thus to disconnect the load-supporting means from the boom at the hinge mechanism,
power-operated means for each pin means mounted on the boom for so shifting the pin means,
motor means connected to a central portion of the load-supporting means and said boom, operable on actuation to thrust said central portion away from the boom, and
control means for the power-operated means for the pins of the pair of hinge mechanisms, whereby each may be actuated, selectively,
said control means including a device actuated by one of the hinge mechanisms, when the same completes a connection between the boom and load-supporting means, freeing for actuation the power-operated means for the other hinge mechanism, and a device actuated by said other hinge mechanism, when the same completes a connection between the boom and load-supporting means, freeing for actuation the power-operated means for said one hinge mechanism.

3,275,172
WRECKING AND LOADING TOOL FOR USE WITH A BACK HOE
Wedad J. Smith, El Paso, Tex., assignor to Wrex-All Implements, Inc., Thibodaux, La., a corporation of Louisiana
Filed May 4, 1965, Ser. No. 453,066
4 Claims. (Cl. 214—138)



1. For use with a back hoe or the like the bucket of which has been removed having a dipstick, actuating cylinder and ram connected to an actuating linkage; a wrecking and loading tool comprising
(a) tool attaching means adapted to be secured to the free end of the dipstick and having a securing element adapted to removably secure said tool attaching means to said dipstick,
(b) static jaw means rigidly secured to said tool attaching means, and
(c) a movable jaw crescent shaped having a pointed free end movably mounted on said tool attaching means positioned to cooperate with the static jaw and adapted to be connected to the ram so as to engage objects between said jaws so that the tool and dipstick can transfer the object to be moved.

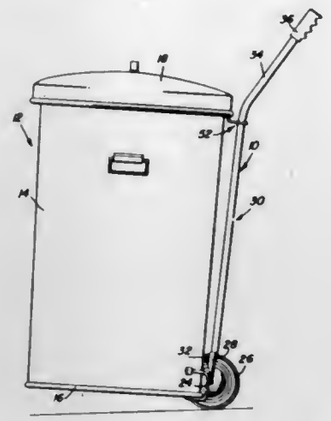
3,275,173
LOAD HANDLING VEHICLE
Keith W. Kampert, Libertyville, and Richard F. Zimmerman, Waukegan, Ill., assignors to International Harvester Company, a corporation of Delaware
Filed Apr. 16, 1965, Ser. No. 448,820
1 Claim. (Cl. 214—767)



A load handling attachment for mounting on a vehicle frame comprising: a boom pivotally mounted at one end to the frame for movement in a generally vertical plane; a support member pivotally mounted on the other end of the boom, the support member having an arm extending forwardly of the other end of the boom; means including a link in parallel relationship to the boom connected between the frame and the support member to move the arm with an upward and forward motion as the boom is elevated; first tong means pivotally connected to the arm; an extensible hydraulic ram pivotally connected at its one end to the frame about an axis substantially coin-

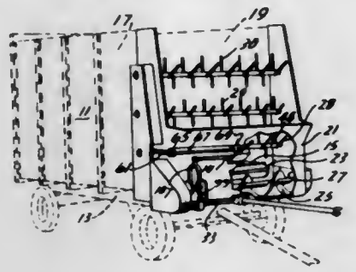
cident with the pivotal mounting of the boom to the frame and at its other end to the first tong means; second

tong means pivotally mounted on the first tong means; and motor means to pivot the second tong means relative to the first tong means to grip the load.



3,275,174
AUTOMATIC LEVELING DEVICE
Joseph H. Konefes, Libertyville, Ill., assignor to International Harvester Company, a corporation of Delaware
Filed June 7, 1965, Ser. No. 461,866
1 Claim. (Cl. 214—761)

In an automatic leveling device for a material handling bucket operated between level, carry, and dump positions by means of a hydraulic ram, the combination including: a bucket position indicator assembly mounted on the ram, the assembly including a drum having bucket position indicia thereon and being rotatably mounted on the head end of the ram and means to rotate the drum in response to extension and retraction of the ram; a camming surface on the drum; a cam follower in operating contact with the camming surface; first valve means selectively operable to direct hydraulic fluid to the ram for pivoting the bucket between the level, carry and dump positions; a source of air pressure; air operated motor means to neutralize the first valve means and terminate pivoting of the bucket; and second valve means in operating relationship with the cam follower to connect the source of air pressure with the motor means for operation thereof when the bucket reaches the level position.

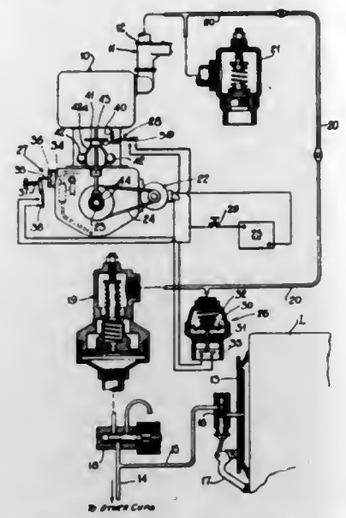


3,275,175
CONTAINER TRANSPORT DEVICE
Robert T. Arnold, % Arnold Metalcraft Co., P.O. Box 122, Lowell, Ind.
Filed May 14, 1964, Ser. No. 367,442
7 Claims. (Cl. 214—383)

1. A transport device comprising in combination a container having a vertical wall with a top rim and a bottom, an axle, a pair of wheels rotatably mounted by said axle, a pair of laterally spaced container-engaging devices fixedly secured to the axle between the wheels, each of said engaging devices including an upper projecting portion engageable with the vertical wall of the container spaced above the bottom and a lower projecting portion extending forwardly beyond the upper portion below the bottom of the container, said lower projecting portion including a forwardly extending arm having an end remote from the axle and an engaging element connected to said end engageable with the container in vertically spaced relation to the upper portion, whereby said container is supported between said pair of engaging devices.

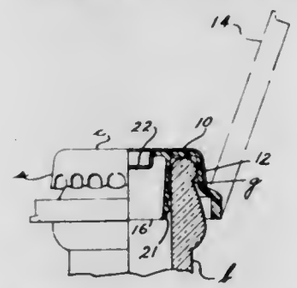
2. The combination of claim 1 including an elongated handle secured to the axle between said pair of engaging devices, and hook means slidably mounted on the handle for engaging the top rim of the container.

3,275,176
FORAGE WAGON CLUTCH
John E. Kasten, 136 Concord Lane, West Bend, Wis.
Filed July 6, 1964, Ser. No. 380,404
9 Claims. (Cl. 214—519)



1. In a forage wagon, the combination of a wheeled support, a conveyer movably carried by said support, a beater rotatably carried by said support, power transmission means on said support adapted for receiving rotary power independently of the travel of the wagon, first clutch means for connecting said power transmission means for connecting said power transmission means to said conveyer, second clutch means for connecting said power transmission means to said beater, and means including a single control lever for selectively operating said second clutch between respective positions engaging and disengaging said beater with said power transmission means and, when said second clutch is in engaged position, for selectively operating said first clutch between respective positions engaging said conveyer with said power transmission means for movement at two different rates of speed.

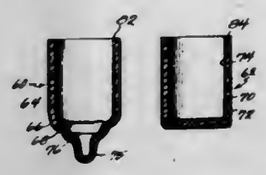
3,275,177
SAFETY ARRANGEMENT FOR ENGINE OPERATED ACCESSORY
William J. Barto, Philadelphia, Pa., assignor to Eaton Yale & Towne Inc., a corporation of Ohio
Filed Jan. 15, 1964, Ser. No. 337,771
8 Claims. (Cl. 214—650)



1. In a lift truck having a load gripping device that requires for its safe operation the application of a degree of power to said device, an internal combustion engine normally operating for supplying power to said device,

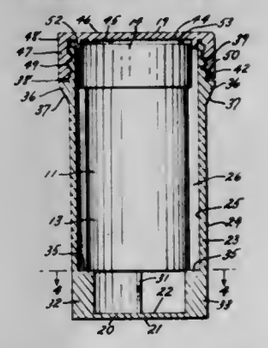
a motor effective when energized to drive said internal combustion engine at a speed that will supply said degree of power, and control means responsive to a de-

crease in the speed at which the engine operates whereby to energize said motor, so that the engine may effect safe operation of said load gripping device when said engine fails to operate normally.



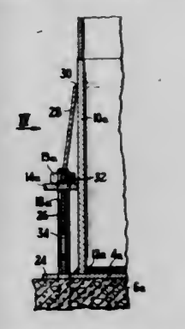
3,275,178
SEALING GASKET USED WITH CROWN TYPE BOTTLE CAPS
Walter C. Lovell, 5 James St., Hazardville, Conn., Harold R. Jorey, Springfield, Mass., and Patricia A. Lovell, Hazardville, Conn.; said Jorey and said Patricia A. Lovell assignors to said Walter C. Lovell
Filed Dec. 6, 1963, Ser. No. 328,552
11 Claims. (Cl. 215—40)

1. A sealing gasket to be used in combination with a crown type bottle cap, said gasket comprising as integrally formed portions a disc portion adapted to overlie the mouth of the bottle and to be compressed thereagainst by the cap, a strap depending from one side of the disc portion and adapted to be confined between the bottle and the skirt of the cap and a ring connected to the lower end of the strap, said ring being generally parallel to said disc portion and large enough to be telescoped over the top of the bottle and adapted to be lifted over the cap so that an upward pull may be exerted on the strap to pry the cap from the bottle.



3,275,179
SPIN WELDED THERMOPLASTIC CONTAINER
John H. Lux, Charlestown, Md., and Ernest O. Ohsol, Wilmington, Del., assignors, by mesne assignments, to Haveg Industries, Inc., a wholly-owned subsidiary of Hercules Powder Company, New Castle, Del., a corporation of Delaware
Filed June 8, 1964, Ser. No. 373,497
11 Claims. (Cl. 220—4)

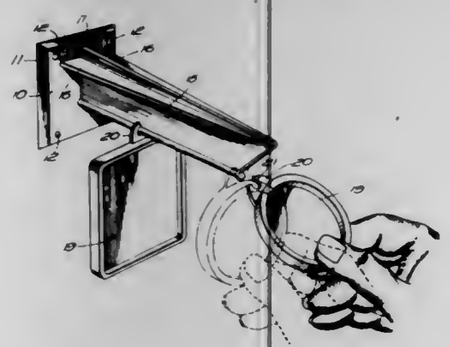
1. A spin-welded container having wall means, said wall means comprising an upper vertical section and a lower vertical section, each section comprising a foam thermoplastic resin portion and at least one non-porous, substantially unfoamed, tough skin of the same resin in-



tegral with said foam portion and a narrow horizontal fused portion substantially devoid of foam welding said vertical portions together.

3,275,180
MAILING CONTAINER CONSTRUCTION
Philip S. Optner, Roslyn Heights, N.Y., and Richard E. Kresge, Elizabeth, N.J., assignors to Lermer Packaging Corporation, Garwood, N.J., a corporation of New Jersey
Filed Jan. 4, 1965, Ser. No. 423,138
3 Claims. (Cl. 220—17)

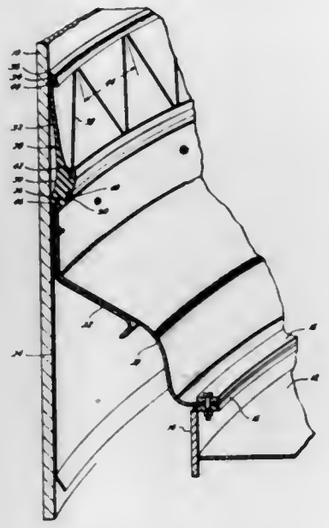
1. In a synthetic resinous tubular mailing container, a hollow cylindrical body having a first closed sealed end and a second open end, said open end having a threaded outer surface, and an annular flange adjacent said threaded surface; and a correspondingly internally threaded cap selectively engageable upon said open end, said annular flange being in abutted relation with respect to said cap when the latter is in engaged condition, and having an external effective diameter substantially equal to that of said cap; and resilient detent means for indicating when said cap is properly located with respect to said flange.



3,275,181
MECHANICAL COUPLING DEVICE, ESPECIALLY FOR PRESSURE VESSELS
André Leclou, Saint-Maur-des-Fosses, France, assignor to Commissariat à l'Energie Atomique, Paris, France
Filed June 13, 1963, Ser. No. 287,583
Claims priority, application France, July 24, 1962, 904,967
6 Claims. (Cl. 220—18)

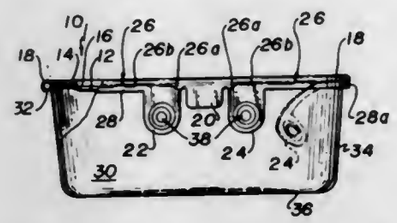
1. In a mechanical coupling device for a vessel having a longitudinal center line, first end and second wall components for the vessel subjected to stresses which tend to

separate said components, a mechanical coupling device between said first and said second components, said device comprising first and second elements secured to said first and to said second components, respectively, said elements being located radially outwardly from said second wall components, and coupling means parallel to said center line located radially outwardly from said second wall component and adapted to draw said components together, mechanical force transfer means connecting at least one of said elements and the corresponding one of said components, said transfer means being connected to said element at a distance from the longitudinal center line of the vessel substantially equal to that of said coupling means and connected to the corresponding one of said components at a level along the center line remote from the level of attachment thereof to said element.



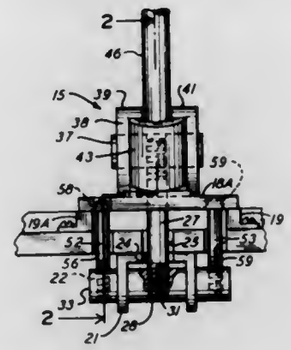
3,275,182
SEAL
Philip Grasso, Stanford, Calif., assignor to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware
Original application Jan. 23, 1962, Ser. No. 168,127, now Patent No. 3,189,185. Divided and this application Jan. 13, 1964, Ser. No. 343,178
2 Claims. (Cl. 220—24)

1. A seal for enclosing a container, said seal having a central wall, an integral peripheral wall having spaced inner and outer walls in cross-section and a connecting wall therebetween to define a groove adapted to receive the peripheral edge or mouth of the container, said inner and outer walls disposed in planes being generally normal to the plane of said central wall such that said seal groove is of a stiffness materially greater than that of said central wall, a mounting tab integral with and extending outwardly from said outer groove wall, said tab further being disposed generally normally to said outer wall, said tab having an opening in a central portion thereof and a slot extending between the opening and the edge of the tab, said slot being of lesser width than said opening so as to provide a pair of opposed legs on each side of said slot and said tab being formed of flexible resilient plastic material so that said legs are distortable from their normal plane to a twisted configuration by the introduction of a member therebetween so as to provide an enlarged temporary opening for said member.



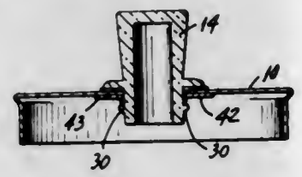
3,275,183
SECONDARY SEAL
Kenneth D. Challenger, Gibsonia, Pa., assignor, by mesne assignments, to Helmerich & Payne, Inc., Tulsa, Okla., a corporation of Delaware
Filed Feb. 10, 1964, Ser. No. 343,660
7 Claims. (Cl. 220—26)

4. In combination with an open end container for holding liquids,
a floating roof therefor adapted to move upwardly and downwardly in said container with changes in the liquid level in said container,
a primary seal having a plurality of shoes supported by said roof in contact with the inside wall surface of said container, and
a secondary seal affixed on the inwardly extending top edges of said plurality of shoes of said primary seal and slidably contacting said inside wall surface,
said secondary seal comprising a flexible annular member having



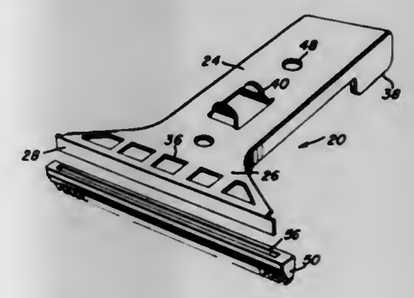
a relatively thickened annular edge fixedly engaging the inwardly extending top edges of said plurality of shoes,
a relatively thinned intermediate annular portion, and
a thickened wall-engaging edge, and including
an undulatory spring spanning said intermediate portion and bearing against said edge portions to bias said wall-engaging edge into engagement with said wall.

3,275,184
CLOSURE HAVING TEAR STRIP OPENING MEANS
Henry G. Henrickson, San Leandro, Calif., assignor to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware
Filed Oct. 19, 1964, Ser. No. 404,580
5 Claims. (Cl. 220—54)



1. In combination with a container body a releasable and reuseable cap therefor, said cap being provided at the outer periphery thereof with a curled-over flange which is adapted to sealable engage the side wall of the container body, said flange being provided with removable tear away sections, a hinge portion and a liftable tab, each of the removable tear away sections being disposed intermediate to and in interconnecting relationship with the hinge portion and the liftable tab, said removable tear away sections being initially joined to said flange by weakened areas imposed in said flange, each removable tear away section including a tear tab projection at the end thereof disposed adjacent the liftable tab whereby the tear tab projections and weakened areas can cooperate to facilitate separation of the removable tear away sections from the flange and initial release of the cap from sealable engagement with the container body and whereby the hinge portion can provide for pivotal movement of the cap about the can body upon the grasping and upward movement of the liftable tab by the user.

3,275,185
CLAMPING APPARATUS
Bert N. Svenson, 10747 Spry St., Norwalk, Calif.
Filed Oct. 29, 1964, Ser. No. 407,439
18 Claims. (Cl. 220—55)

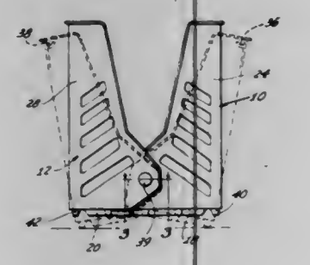


1. An adjustable cam clamp for clamping a workpiece to a work rest and comprising a threaded arbor bolt, means pivotally securing the threaded arbor bolt to the work rest, a cam arbor secured to the threaded arbor bolt, a clamping cam journalled on the cam arbor and adapted to bear against and urge the workpiece into clamping relationship with the work rest, handle means adapted to turn the clamping cam about the cam arbor, means for relative rotation between the cam arbor and the threaded arbor bolt such that the cam arbor is displaced relative to the means securing the arbor bolt to the work rest, said securing means adapting the threaded arbor bolt to arcuate motion toward and away from the work rest, and workpiece restraining means connecting between the workpiece and the securing means such that the workpiece hinges away from the work rest in association with the threaded arbor bolt.

3,275,186
PERCOLATOR COFFEE POT AND TOP THEREOF
Martin Himmel, Mount Vernon, N.Y. (% Bloom's Houseware, 415 E. Tremont Ave., Bronx, N.Y.)
Filed Apr. 13, 1964, Ser. No. 359,294
10 Claims. (Cl. 220—82.5)

1. A percolator top member made of transparent material and being hollow and closed at its upper end and having a lower end portion open at its lower end, said top member having an annular transversely disposed portion extending radially outwardly of said lower portion and facing in one direction, and a clamp member having an annular portion disposed transversely of the axis of said top member and facing in an opposite direction, and a portion extending from said annular portion of said clamp member and offset therefrom in the direction of the axis of said top member, interengaging means on the lower end portion of said top member and on said offset portion of said clamp member, whereby to clamp said top member and clamp member to opposite sides of a substantially flat top wall of a percolator lid interposed between said annular portion of said top member and said clamp member, and having an opening through which said lower end portion may pass, whereby said top member may be clamped to any lid whose top wall opening is larger than said lower end portion of the top member and smaller than the outer periphery of the annular portion of said top member and the outer periphery of the annular portion of said clamp member.

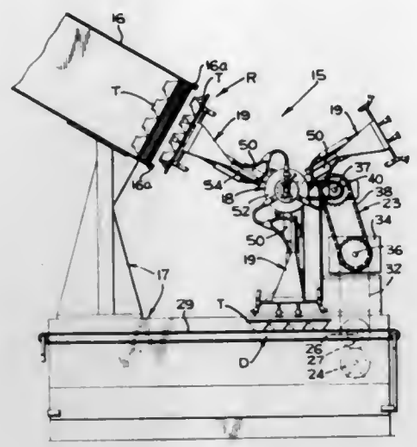
3,275,187
PAINTER'S UTILITY IMPLEMENT
Raymond L. Lamoureaux, R.D. 3, Cortland, N.Y.
Filed Sept. 25, 1964, Ser. No. 399,288
2 Claims. (Cl. 220—90)



1. A painter's utility implement comprising an elongated body, a transversely enlarged head forming a continuation of the body at one end thereof, said head having an upturned flange transversely across the outer end thereof, said flange being planar throughout the height thereof and terminating in an upwardly directed straight upper edge extending along the full length thereof, a pair of spaced side walls projecting upwardly from the longitudinal sides of the body, said walls extending along a major portion of the length of said body, said walls diverging outwardly and continuing along the opposite sides of the head, at least one hole through said head between the flange and the elongated body, a pair of side wall extensions adjacent the free end of the elongated body, each of said extensions being generally coplanar with one of said side walls and projecting upwardly at approximately a right angle therefrom, mounting means depending from said body for releasable engagement with a paint can rim, and an elongated surface working attachment, said attachment having, along one edge thereof, an elongated slot of a length, width and depth so as to frictionally and releasably receive substantially the entire flange, the edge of said attachment opposite from said one edge being positioned outwardly from the flange edge generally in the plane of the flange edge and being in the form of a surface working edge.

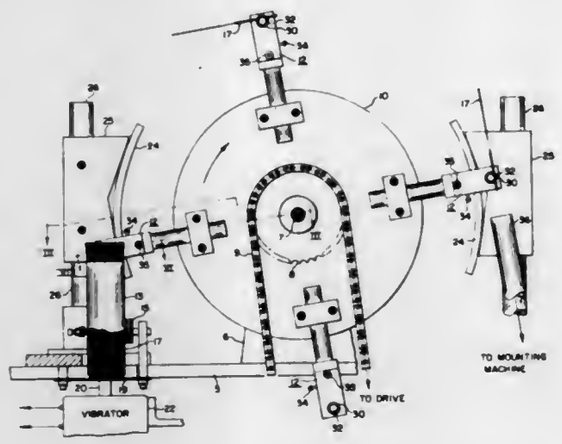
3,275,188
RECEPTACLE
James D. Wilson, Long Beach, Calif., assignor to Banner Metals, Inc., Compton, Calif., a corporation of Ohio
Filed Jan. 18, 1965, Ser. No. 426,062
3 Claims. (Cl. 220—97)

1. A nestable-stackable container including: a first member defining a first side wall for the container, further defining a first portion of a bottom for the container extending perpendicularly to said first side wall, and further defining a first pair of right-angled triangular-shaped sections each having an apex adjacent the upper edge of said first side wall and each forming a first portion of each of a pair of end walls for the containers, said first portion of each of said end walls extending perpendicularly to said



first side wall and perpendicularly to said first portion of said bottom; a second member defining a second side wall for the container, further defining a second portion of the bottom for the container extending perpendicularly to said second side wall and adapted to overlap said first portion of said bottom, and further defining a second pair of right-angled triangular-shaped sections each having an apex adjacent the upper edge of said second side wall and each forming a second portion of each of the aforesaid pair of end walls for the container, said second portion of each of said end walls extending perpendicularly to said second side wall and perpendicularly to said second portion of said bottom and adapted to overlap respective ones of said first portions of said end walls; a pair of pin members positioned adjacent said bottom portions and extending through the overlapping portions of respective ones of said end walls pivotally to couple said first member to said

second member for angular movement of said first and second members between an opened and a closed condition about an axis extending adjacent and transversely of said bottom; first stacking means mounted on respective ones of said side walls at the respective upper edges thereof, said first stacking means comprises a pair of first stacking members formed integral with respective ones of said side walls and extending along the respective upper edges thereof to define a pair of stacking grooves; and second stacking means mounted on respective ones of said first and second members, said second stacking means comprises a pair of second stacking members each having a bead-like configuration and formed integral with respective ones of said first and second members and extending across the underside of the respective bottom portions thereof in alignment with respective ones of said first stacking members to be received in the first stacking members of a like receptacle.



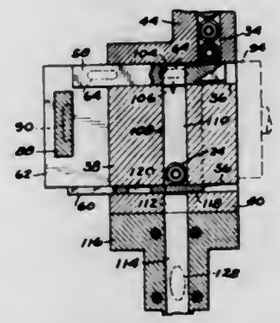
3,275,189
TRAY FEEDING APPARATUS
Harry G. Goldsborough and Carl J. Gerlach, Green Bay, Wis., assignors to FMC Corporation, San Jose, Calif., a corporation of Delaware
Filed Aug. 20, 1964, Ser. No. 390,810
10 Claims. (Cl. 221—36)

1. Apparatus for de-nesting pocketed trays from a stack of trays with each tray having a floor and flared end walls projecting therefrom, comprising a magazine for supporting a stack of nested trays and having an open end through which the trays are individually withdrawn, tray supporting fingers secured to opposite portions of said magazine and projecting within said open end in position to engage opposite edges of the end walls of the foremost tray, first gripping means movable in a direction normal to the plane of said floor into position to grip the floor of the tray, second gripping means comprising carriages, curved arms secured to said carriages and projecting toward said end walls from said carriages, gripping elements on the ends of said arms movable in a direction transversely of and normal to said first gripping means into gripping engagement with the flared end walls to first grip and then partially collapse said end walls by pulling the end walls inwardly out of engagement with the tray supporting fingers, and means for moving said

first and second gripping means with the foremost tray attached thereto away from said magazine and stack of trays therein.

3,275,190
LEAD-WIRE FEEDING APPARATUS
Phillip A. Livera, Bloomfield, and Samuel B. Lyons, West Orange, N.J., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Apr. 8, 1965, Ser. No. 446,548
8 Claims. (Cl. 221—93)

1. An apparatus for withdrawing lead-wires from a bundle and feeding them individually to a conveyor for subsequent use, said apparatus comprising:



(a) a container for holding a bundle of stacked lead-wires slanting in one direction slightly from the vertical;

(b) means operatively associated with said bundle of stacked lead-wires in said container to cause said lead-wires to traverse a generally circular path in their direction of slant;

(c) a transfer member provided with an arm having a pick-up finger operable to grasp an individual lead-wire in said container; and

(d) drive means for operating said transfer member to cause said arm to move said pick-up finger into said bundle with attendant grasping of an individual lead-wire and the withdrawing thereof from said container, and said transfer means upon continued operation thereof moving said arm and pick-up finger to cause the latter to deposit its grasped individual lead-wire on a conveyor for further transmission thereof.

3,275,191
ARTICLE-FEED APPARATUS HAVING AN ARTICLE TRANSFER MEANS AND FLUID MEANS TO PROPEL ARTICLES THROUGH A TUBE
Murdo A. MacDonald, Bloomfield Hills, Mich., assignor to Tru-Tork, Inc., Birmingham, Mich., a corporation of Michigan
Filed June 29, 1965, Ser. No. 467,866
12 Claims. (Cl. 221—175)

1. Apparatus for feeding one at a time from a source to a delivery point a series of articles, each having surface portions by engagement with which said article is orientable in a predetermined attitude, said apparatus comprising:

a track, and means operable to introduce said articles into said track in a predetermined attitude,

a transfer movable laterally of said track and having an opening which in one position of said transfer is aligned for reception of an article from said track, and in another position is displaced from said track,

means defining a guideway positioned for reception of an article from said opening in said other position of said transfer, said guideway extending downwardly so that a received article passes gravitationally therethrough, a flexible tube having a longitudinal passageway therein extending to said delivery point, means mounting said tube so that said passageway is positioned to receive an article from said guideway,

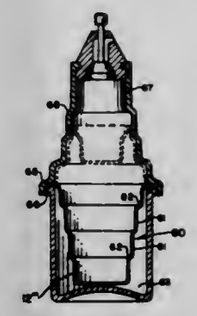
said track, transfer opening, guideway, and passageway having control surfaces which are operative by engagement with said surface portions of said articles to hold the same in their predetermined attitude,

a closure movable laterally to and from alignment with an intermediate portion of said guideway and being thereby operative to close and open said guideway,

motor means operable to move said transfer and closure so that said transfer opening and closure are moved to and from alignment with said guideway substantially simultaneously,

means operable when said closure is aligned with said guideway to introduce air under pressure into a portion of said guideway below said closure for propelling an article through said passageway to said delivery point, and to discontinue said pressure when said closure is retracted from said guideway,

said closure, when in alignment with said guideway, providing a transitional support for an article received from said transfer and a pneumatic closure for containing said air under pressure,



the control surfaces of said passageway having relatively larger tolerances with respect to said surface portions of said articles than control surfaces upstream thereof to facilitate curving of said tube without binding against articles passing therethrough and to facilitate escape of air past articles propelled thereby in said tube.

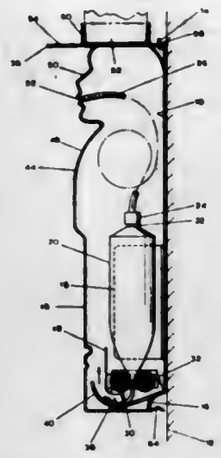
3,275,192
SHEET DISPENSER
Georg Cranskens, Wedel, Holstein, Germany, assignor to Lumoprint Zindler K.G., Hamburg, Germany, a corporation of Germany
Filed Feb. 17, 1964, Ser. No. 345,156
Claims priority, application Germany, Feb. 25, 1963, L 44,205
10 Claims. (Cl. 221—259)

10. A device for dispensing sheets from at least two stacks, comprising an upwardly open lower container having a side forming an outlet for sheets from a respective stack receivable in said lower container; an upper container mounted upon said lower container and completely covering same for receiving another stack of sheets to be dispensed; means supporting said upper container upon said lower container for reciprocating movement of said upper container toward and away from the outlet side in a plane of the upper container; and feed means affixed to said upper container and shiftable therewith for successively feeding sheets from the stack in said lower container past said outlet side during successive reciprocations of said upper container upon said lower container, said upper container having an access opening permitting withdrawal of sheets from the stack in said upper container.

3,275,193
CONTAINER AND METHOD RELATING TO TELESCOPICALLY EXPANDED DIAPHRAGMS
Irwin R. Barr, Baltimore, Md., assignor to Aircraft Armaments, Inc., Cockeysville, Md., a corporation of Maryland
Continuation of application Ser. No. 179,970, Mar. 15, 1962. This application Dec. 21, 1964, Ser. No. 423,631
11 Claims. (Cl. 222—1)

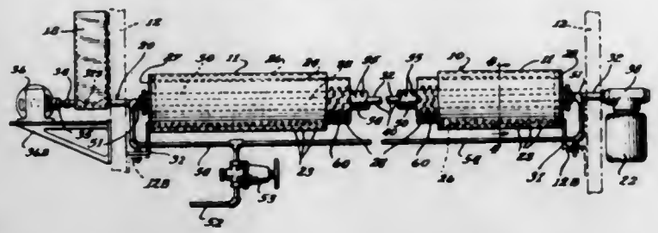
1. The method of forming a larger enclosed chamber from a smaller enclosed chamber defined by a telescopically expandable folded tubular body portion closed at one end and a further fluid-tight-interconnected body portion having an open end and an opposite closed end facing the closed end of said telescopically expandable body portion, said folded tubular body portion being formed of material capable of cold flow to a substantially permanent deformtion and having a plurality of annular smoothly undulating folds disposed along its length and between said closed end and said open end of said further interconnected body portion, comprising exerting a longitudinally expanding pressure on said one closed end of said folded tubular body portion in a direction longitudinally away from said closed end and toward said open end of said further interconnected body portion and along the direction of potential telescopic expansion thereof through

said open end, and telescopically longitudinally moving said closed end and the connecting undulating folded side wall material of said folded tubular body portion from within itself and away from said opposite closed end and through said open end, and sequentially plastically deforming said undulating folds through an inside-out incremental rolling reverse bend and radially stretching and expanding the material of the inner folds beyond its elastic elongation limit but within the elongation-to-rupture limit upon passing of said inner folds through said reverse bend, all of said steps being effected as a function of differential pressure on said one closed end of said folded tubular body portion to thereby turn said tubular body portion inside out and expand said chamber.



3,275,194
DISPENSER OF TREATMENT MATERIALS INTERPOSABLE BETWEEN TWO GARDEN HOSE PORTIONS
Morgan M. Moulder, Camdenton, Mo.
Filed Sept. 17, 1964, Ser. No. 397,087
3 Claims. (Cl. 222—48)

1. A container adapted for connection with ordinary garden hose comprising a cylindrical body member defining a chamber and having a radially inner outwardly extending inlet and outlet, said inlet and outlet being threaded to provide hose coupling means; said body member provided at either end with a radially outer outwardly extending circumferential flange extending a distance at least substantially coplanar with said inlet and outlet; a cylindrical member axially aligned within said chamber and in communication with said coupling means, said cylindrical member together with said cylindrical body member defining an annular chamber; said cylindrical member provided with means for communicating said annular chamber with said cylindrical member comprising a cylindrical tube having its longitudinal axis disposed transverse to the longitudinal axis of said body member and provided with an aperture for communicating said annular chamber with said cylindrical member and dispensing means axially aligned in said cylindrical tube.

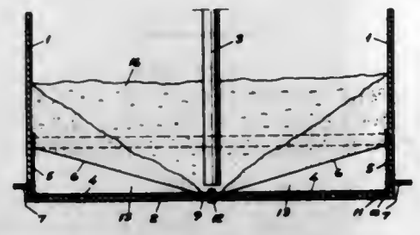


3,275,195
INTEGRATED HOLDER AND DISPENSER
Patricia M. Reinstra, 413 S. H, Imperial, Calif.
Filed June 7, 1965, Ser. No. 461,700
9 Claims. (Cl. 222—102)

1. In combination:
(A) a collapsible tube containing a fluid to be dispensed by the collapsing of the tube, said tube having an outlet at one end thereof;
(B) means forming a support for the tube;
(C) a frame having an outlet;
(D) a separate flexible hose connected to the outlet of the tube and extending to the outlet in the frame;
(E) a pair of rollers for frictionally receiving the opposite end of the tube therebetween for compressing

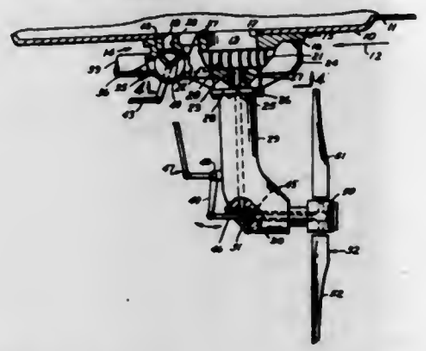
the tube for squeezing the fluid through the outlet of the tube and for progressively moving the outlet of the tube toward the rollers;
(F) and means for rotating one of the rollers.

3,275,196
ANTI-OFFSET POWDER DISTRIBUTOR
Russell C. Warczak, Chicago, Ill., assignor to Intercompany Corporation, a corporation of Illinois
Filed July 1, 1964, Ser. No. 379,637
13 Claims. (Cl. 222—193)



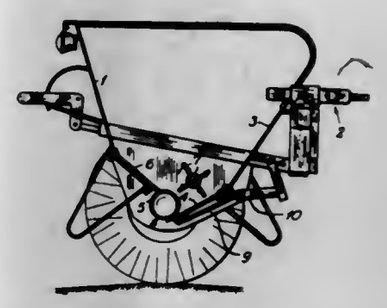
9. In an anti-offset powder distributor for printing presses, a bridge structure adapted to be mounted transversely across and adjacent to the path of advancing sheets issuing in succession from a delivery end of a printing press, means having spaced dispensing openings carried by said bridge structure for mechanically distributing powder across the span of the bridge structure, means for directing air past said dispensing openings with an aspirating effect to withdraw powder from said dispensing openings and entrain said powder in said air, means for varying said aspirating effect, and means defining an enclosed path terminating in uniformly spaced delivery openings through which such air and the entrained powder are discharged in a uniformly distributed relation across the entire span of said bridge structure.

3,275,197
INFLATABLE DISCHARGE DEVICE
Leif Sune Ingolf Eklund, Malmo, Sweden, assignor to Interconsult Aktiebolag, Malmo, Sweden, a corporation of Sweden
Filed Oct. 23, 1964, Ser. No. 406,086
Claims priority, application Sweden, Oct. 24, 1963, 11,685/63
9 Claims. (Cl. 222—195)



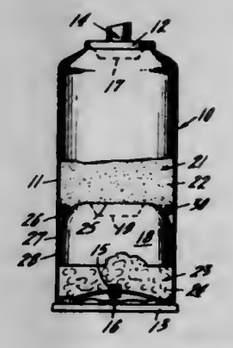
2. A discharge device for a container holding powdery and granular materials which comprises:
(a) an inflatable membrane member having a top of a flexible pervious material and sides and bottom constructed of a flexible, impervious material;

(b) means for attaching said member to the inside of the container so that when the member is inflated, it forms a V-shaped incline extending downward from said sidewalls toward the center portion of said bottom;
(c) a pressure-air source communicating with the space defined by the top, sides and bottom of said membrane; and



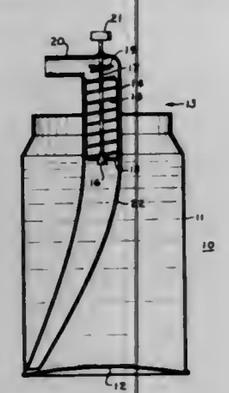
(d) means for discharging the powdery and granular materials after they have become fluidized by the pressure air;
whereby said pressure air inflates said member and simultaneously passes through the pervious portion of said membrane to fluidize the material disposed above said membrane inside said container, thus facilitating egress of the materials from the container.

3,275,198
AIR STREAM DRIVEN PUMPING SYSTEM
Conrad R. Barlow, Redondo Beach, Calif., assignor, by mesne assignments, to Transland Aircraft, Inc., Redondo Beach, Calif., a corporation of California
Continuation of application Ser. No. 185,257, Apr. 5, 1962. This application Sept. 20, 1965, Ser. No. 502,793
13 Claims. (Cl. 222—310)



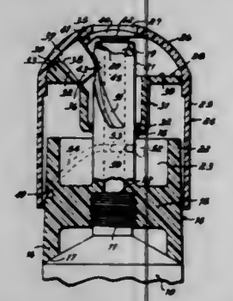
1. A fluid handling system adapted to be mounted in an opening in the bottom of a tank having a port in the bottom thereof, comprising:
a base plate attachable to the bottom of the tank, said base plate having a pair of holes; a rotary pump mounted underneath one of said holes and rotating in a plane in close proximity and parallel to the extension of the base plate, said pump having an outlet port extending substantially at right angles to said one hole;
means for selectively connecting said outlet port to the other one of said pair of holes and to conduit means provided for connection to a spray boom;
a propeller drivingly connected to the pump for driving said pump; and
means for mounting said propeller to said base plate so that the propeller faces the airstream, with the airstream in the axial region of the propeller bypassing the pump, said propeller having a plane of rotation, said planes forming a dihedral angle so that said pump sits at an angle to the airstream and to confront the airstream with less than its major cross-sectional area.

3,275,199
SPREADING DEVICE FOR FINE STREWING MATERIAL SUCH AS SALT OR FERTILIZERS
Alfred Thomsen, Askov, pr. Vejen, Denmark
Filed Nov. 9, 1964, Ser. No. 409,760
Claims priority, application Denmark, Sept. 19, 1964, 4,617/64
6 Claims. (Cl. 222—313)



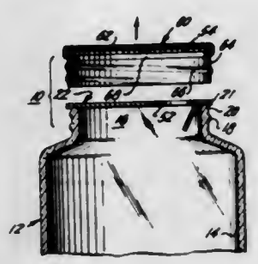
1. A spreading device for fine strewing material such as salt or fertilizers and with a container the bottom of which has a slot extending transversely of the direction of travel of the device, along which slot there is provided a rotating spreading roller with projecting carrier members and below which roller there is a plate of rubber or a similar resilient material pressing with its upward-facing surface against the underside of the roller, the said plate being of a material so soft that the carrier members, which consist of a large number of low, in vertical projection rather steep ribs having substantially greater longitudinal spacing than the longitudinal thickness of said ribs, may be substantially received in the rubber material when the plate, which opposite the roller is supported by one or more regulable pressure members, is pressed against the roller by the said pressure members.

3,275,200
PRESSURIZED DISPENSING CONTAINER
Alexander Livingstone, Washington, N.J., assignor to American Can Company, New York, N.Y., a corporation of New Jersey
Original application Nov. 16, 1962, Ser. No. 238,208. Divided and this application Dec. 14, 1964, Ser. No. 425,992
4 Claims. (Cl. 222—389)



1. A dispensing container, comprising a tubular body sealed at opposite ends and mounting valve means at one of said ends, an imperforate generally cup-shaped piston mounted in an inverted position within said body and movable therein, said piston dividing the interior of said body into a product chamber and a propellant chamber, and a relatively flexible annular wax seal member freely received between said piston and said body and not connected to said piston or said body preventing product and propellant admixture.

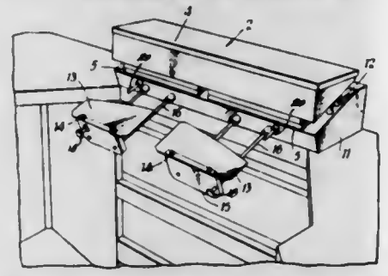
3,275,201
FLUX COMPOSITION PACKAGE
William R. Tedeschi, Norwich, and Donald A. McCarthy, Milford, Conn., assignors to General Dynamics Corporation, New York, N.Y., a corporation of Delaware
Filed Mar. 10, 1964, Ser. No. 350,814
21 Claims. (Cl. 222—402.25)



1. A pressurized flux package comprising a pressure-tight container having a valve-controlled opening and containing a composition for use in producing a flux composition on metal surfaces to be united by brazing, soldering, welding, and the like, comprising a mixture of a flux composition and a volatile propellant in liquid phase, the composition being connfied in the container under the vapor pressure of the propellant, said propellant being a non-flammable halogenated hydrocarbon containing at least one fluorine atom, said propellant having a vapor pressure in the range from about 15 to about 300 pounds per square inch gauge at 0° C.

3,275,202
CLOSURE DEVICE FOR CONTAINERS HAVING AN AXIAL ROTARY AND LONGITUDINALLY MOVABLE APERTURED CAP
David H. Trott, 3351 Stettinius Ave., Cincinnati, Ohio 45208
Filed May 25, 1965, Ser. No. 458,698
9 Claims. (Cl. 222—520)

1. A closure device comprising a first member adapted to be connected to a container or the like having a dispensing opening, said first member having a neck extending therefrom with a passage therein communicating with the dispensing opening of the container when said first member is connected to the container, a second member surrounding said first member and having an opening in one end for passage of said neck therethrough when said second member moves axially relative to said first member by rotation of said second member about the axis of said passage in said neck, said second member having a cap mounted thereon and disposed within said second member, said cap being movable from a position in which it closes and seals said passage in said neck to an open position in which it is out of the path of said neck, means to move said cap from its passage closing position to a position in which said cap blocks the path of said neck, and said cap and said neck having cooperating means to move said cap from its blocking position to its open position and vice versa during rotation of said second member about the axis of said passage in said neck, said cooperating means causing movement of said cap from its blocking position to its open position only when said second member is moved only rotatably about the axis of said passage in said neck of said first member and not during axial and rotatable movement of said second member with respect to said first member.

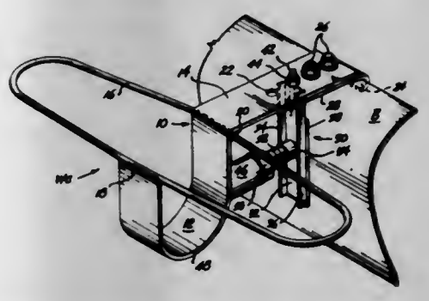


3,275,203
LOW VAPOR PERMEABILITY CONTAINER CLOSURE INCLUDING PUSH-OUT TAB FOR FORMING POUR MOUTH AND METHOD FOR MAKING SAME
Fred Nossal, Brooklyn, and Max Klein, Bronx, N.Y., assignors to Ferdinand Gutmann & Co., Brooklyn, N.Y., a corporation of New York
Filed July 19, 1965, Ser. No. 472,816
7 Claims. (Cl. 222—541)

3. A closure for a container having a neck terminating in an open mouth, said closure including:
(a) a low water vapor permeability flat circular multilayer laminated flexible sheet inner seal completely overlying and closing said mouth;
(b) a low water vapor permeability bond securing the seal completely around its periphery to the rim of the mouth;
(c) a low water vapor permeability flat circular stiff resilient liner coextensive with and superimposed over the inner seal, the liner having a margin jutting radially outwardly of the rim of the mouth;
(d) the liner having a facing which is in face-to-face contact with the inner seal;
(e) said facing being solid at room temperature and forming a bond between the liner and the inner seal, said facing being fluidifiable upon the application of heat;
(f) the bond between the inner seal and the rim being stronger than the bond between the liner and the inner seal so that when the liner is pulled away from the container it will separate from the inner seal and the inner seal will remain connected to the rim;
(g) a slit in the inner seal;
(h) said slit defining the boundary of the body of a tab except for its base, said base being integral with the inner seal;
(i) said slit running through at least the lamination of the inner seal proximate to the interior of the container and ending short of the surface of the liner distant from the interior of the container;
(j) said slit being disposed wholly inwardly of the rim and being formed while the facing is fluidified by heating and can flow back from a displaced location in the vicinity of the slit to solidify upon cooling and restore any impairment of the integrity of the inner seal and liner whereby as long as the liner is bonded to the seal the integrity and low vapor permeability of the closure is maintained;

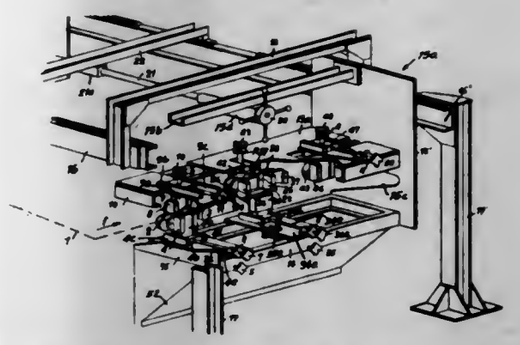
(k) said slit providing a weakened zone in the inner seal to facilitate bending of the tab about its base away from the remainder of the seal so as to leave an opening of restricted area for the dispensing of any material stored within the container; and
(l) a skirted cap threadedly engaging the neck of the container, the crown of the cap pressing the liner against the inner seal and the cap having an internal protrusion spaced from and near the crown and underlying the jutting margin of the liner so that when the cap is unscrewed from the neck the cap strips the liner from the seal and holds the liner near the crown of the cap.

3,275,204
PRESS FOR FORMING COLLARS, CUFFS AND THE LIKE FOR WEAR
Nigel Sturges, Chatham, and Leonard Charles Nutton, Rochester, England, assignors to Sewprima Limited, Brompton, England, a British company
Filed Apr. 6, 1964, Ser. No. 357,672
Claims priority, application Great Britain, Apr. 8, 1963, 13,848/63
2 Claims. (Cl. 223—2)



1. A press for forming garments such as collars, cuffs and the like for wear, including a stationary block, a movable block spaced in its press-open position from said stationary block, a casing member supporting said movable block, a layer of resilient material attached to said movable block and forming a facing therefor and opposing said stationary block, said layer substantially covering the upper surface of the movable block, means for moving said movable block towards and away from said stationary block between pressing and non-pressing positions, heating means for said stationary block, a former for the reception of a garment to be pressed, a carriage on which said former is mounted, said carriage being supported on shafts slidable in said casing member, means for guiding said former to a position between said stationary block and said movable block and switch means adapted to be operated by movement of said carriage to release power to press said stationary block and said movable block together when said former lies between them.

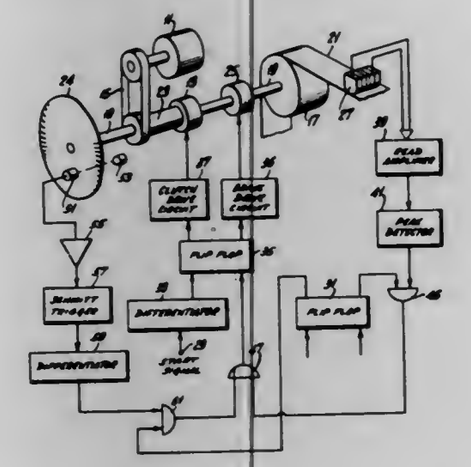
3,275,205
STRAP FOR RESCUE, CARRYING, AND EMERGENCY USE
James W. Howd, 1200 Hammel St., and Robert E. Howd, 177 Stevenson, both of Akron, Ohio
Filed May 21, 1965, Ser. No. 457,689
3 Claims. (Cl. 224—6)



1. A reinforced carrying strap of about 4 to about 15 feet in length for general use but being adapted to be wrapped around the human body to serve as a carrying harness which comprises an elongate belt of high strength, flexible material where each end is folded back on the belt and stitched to the belt to form a loop, and wherein opposed portions of each formed loop are stitched together at at least one point whereby there are at least two loops each of the size to form a handle on each end of the strap.

3,275,206
SPORTS CYCLE CARRIERS
Paul H. Croft, 7241 S. Tacoma Way, Tacoma, Wash.
Filed Dec. 29, 1964, Ser. No. 421,980
4 Claims. (Cl. 224—42.03)

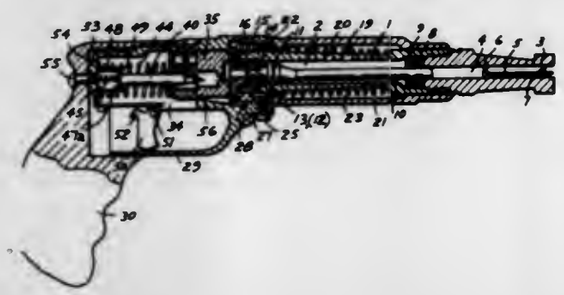
1. A wheel chock attachment for an automotive vehicle bumper, said attachment comprising means for underlying and supporting a portion of a cycle wheel, and mounting means connected thereto for mounting the attachment onto a bumper, and said mounting means including a forwardly extending tongue member having a terminal hook at its forward end for engaging the upper edge of the bumper, an elongated bumper contacting member depending downwardly from said tongue, rearwardly of said terminal hook, means pivotally mounting the upper end of said member onto said tongue, and brace means located below said tongue and comprising a screw housing including a head having a forwardly directed, internally threaded opening formed therein, and a screw threadable into and out from said opening, said screw having a head which bears against the rear of said bumper contacting member.



3,275,207
METHOD OF AND APPARATUS FOR CUTTING GLASS
Jean Preudhomme, Franiere, Namur, Belgium, assignor to Compagnie de Saint-Gobain, Neuilly-sur-Seine, France
Filed Apr. 14, 1965, Ser. No. 448,134
Claims priority, application France, Apr. 21, 1964, 971,693
21 Claims. (Cl. 225—2)

19. The method of automatically severing a band of glass from a ribbon of reinforced glass moving in its own plane in the direction of its length, and having a scored line in a first surface thereof, parallel with said direction, comprising, maintaining said ribbon in its plane of movement while exerting a force on the band at a first station, to break the band along said line, and subsequently at a second station positively moving the band out of said

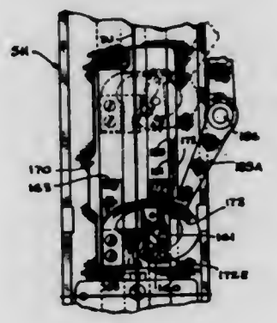
plane by exerting thereon a force normal to said plane to thereby sever the reinforcement holding said band to the ribbon.



3,275,208
INCREMENTAL TAPE DRIVE SYSTEM
Eleuthere Poumakis, East Islip, N.Y., assignor to Potter Instrument Company, Inc., Plainview, N.Y., a corporation of New York
Filed Sept. 14, 1964, Ser. No. 396,064
10 Claims. (Cl. 226—9)

1. An incremental magnetic storage tape drive system comprising,
a capstan for driving a magnetic storage tape,
a motor,
a clutch operable when energized to couple the output of said motor to drive said capstan,
a brake operable when energized to brake said capstan,
bi-stable means having a first stable state and a second stable state,
means operable to energize said clutch only when said bi-stable means is in said first stable state,
means operable to energize said brake only when said bi-stable means is in said second stable state,
means selectively operable to set said bi-stable means in said first stable state, and
means responsive to the movement of said capstan to a predetermined position to set said bi-stable means to said second stable state.

3,275,209
NAIL-DRIVING DEVICE
Kern Börje Emanuel Hansén, Myrsjovagen 8, Saltsjo Boo, Sweden
Filed Oct. 10, 1963, Ser. No. 315,313
Claims priority, application Sweden, Oct. 23, 1962, 11,332/62; Apr. 29, 1963, 4,672/63
12 Claims. (Cl. 227—10)

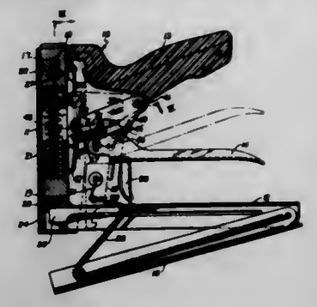


1. A nail driving device comprising an outer housing and an inner housing encompassed by the outer housing, said inner housing being lengthwise displaceable in reference to the outer housing and having a lengthwise bore; a muzzle for receiving a nail to be driven at one end of the bore of said inner housing, said muzzle having an inner diameter substantially equal to the largest outer diameter of the nail; an end wall at the other end of said inner housing bore, said end wall having an aperture therethrough to define a chamber for receiving an explosive charge therein; a handle assembly pivotally mounted on said outer housing for pivoting the handle assembly into and out of abutment with the outside of said apertured end wall of said inner housing bore, said handle assembly comprising a triggering assembly including a firing pin and a spring coacting with said pin for propelling the same into said chamber to detonate a charge inserted therein, spring loading means slidable in said handle assembly and controlled by the position of the inner housing in reference to the outer housing, said spring loading means being engaged with said apertured housing end wall for loading said firing pin spring by displacement of the inner housing toward said handle assembly, locking means coacting with said firing pin for locking the same against the action of said spring, said locking means being displaceable in unison with said spring loading means, release means movable to a position for releasing said locking means, said release means being operable in a predetermined position of displacement thereof thereby freeing said firing pin for propulsion into said chamber by the action of said spring, a piston displaceable in said inner housing, a driver for driving a nail received in the muzzle, said driver being secured to said piston and extending therefrom toward the muzzle, the length of the driver being such that the driver protrudes into the muzzle bore with a close fit when the piston is positioned in the inner housing to abut against said apertured housing end wall, detonation of a charge received in said chamber generating a gas pressure propelling the piston from said abutting position toward the muzzle thereby causing the driver to drive the nail, said inner housing having intermediate the length of its bore at least one venting port permitting escape of air from the bore until the piston passes said port while being propelled toward the muzzle, the remaining part of travel of the piston in the direc-

tion toward the muzzle causing compression of the air in said housing bore ahead of the piston, the gas pressure generated by detonation of the charge being dissipated through said port, whereby the compressed air in said housing bore part brakes the piston and re-expansion of the compressed air returns the piston to said abutting position, a first re-coil compensating spring means including a first coil spring disposed in the outer housing and encompassing the inner housing, said first coil spring urging the inner housing outwardly in reference to the handle assembly, a second re-coil compensating spring means including a second coil spring disposed within the handle assembly and urging said spring loading means for the firing pin spring into a position in which the firing pin spring is relaxed, said first and said second coil springs and said firing pin spring being axially aligned with said housing bore so that displacement of the inner housing deeper into the outer housing and toward the handle assembly through a predetermined distance effects loading of the two coil springs and the firing pin spring, displacement of the inner housing relative to the outer housing and toward the handle assembly loading said first and second coil springs and moving said spring loading means into the position loading the firing pin spring and said locking means into the position for release by said release means, the release of the energy stored in the two loaded coil springs upon detonation of the charge by releasing the firing pin and the braking force of the compressed air acting cumulative in the direction in which

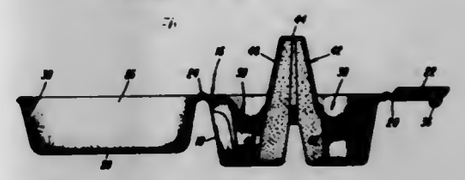
the nail is propelled by the driver and in opposition to the force of the gas pressure generated by the detonation of the charge thereby substantially neutralizing the recoil force generated by said gas pressure.

3,275,210
SIGNATURE MACHINE
William B. McCain, Hinsdale, and James F. Cosgrove, Western Springs, Ill., assignors to Chicago Machinery Laboratory, Inc., Chicago, Ill., a corporation of Illinois
Original application Dec. 17, 1962, Ser. No. 245,322. Divided and this application Jan. 25, 1965, Ser. No. 427,624
6 Claims. (Cl. 227—82)



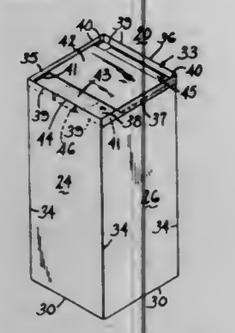
1. In a machine wherein a wire staple is to be used to join sheets or the like, apparatus including a stapling head through which a wire is fed to be advanced to a staple forming position, reciprocal gripper jaws having a wire advancing stroke to so feed a wire through the head when the gripper jaws are closed on the wire, means for holding open the jaws during the return stroke thereof, a pivotal wire holder retaining the wire and normally presenting the wire to the gripper jaws; and means for pivoting said holder to displace the wire from said jaws during the open state of the latter when it is desired to prevent formation of a staple.

3,275,211
SURGICAL STAPLER WITH REPLACEABLE CARTRIDGE
Leon C. Hirsch, Scotch Plains, and Frank Ourednik, Union City, N.J., assignors to United States Surgical Corporation, Baltimore, Md., a corporation of Maryland
Filed May 10, 1965, Ser. No. 454,300
8 Claims. (Cl. 227—124)



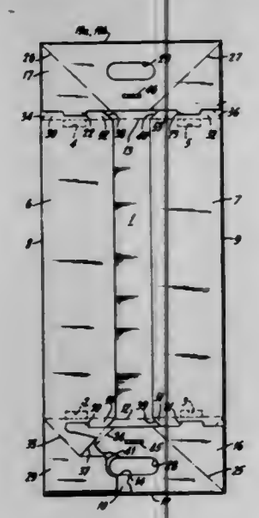
1. A staple cartridge, comprising a body portion of generally U-shaped cross section; a plurality of aligned staple retaining slots penetrating the body portion; a pair of rails disposed in spaced apart relation along the body; and a planar plate affixed to the body portion in spaced apart relation with the rails and protruding beyond the lateral dimension of the body portion to form grooves between it and each of the rails, said body portion being recessed to receive pin means.

3,275,212
STAPLER
Oscar H. Johnson, Holden, Mass., assignor to Parker Mfg. Company, Worcester, Mass., a corporation of Massachusetts
Filed July 22, 1964, Ser. No. 384,336
7 Claims. (Cl. 227—132)



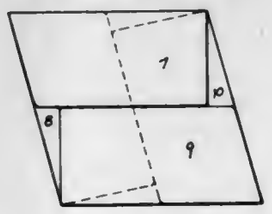
1. A stapler, comprising
(a) an elongated base adapted to carry a supply of staples and to feed them toward one end,
(b) an elongated housing extending at a right angle to the said base and having a hammer movable longitudinally of the housing toward the said one end to drive a staple,
(c) an elongated cantilevered grip extending at a substantial angle to the housing at the end opposite the end which is associated with the base,
(d) a trigger for actuating the hammer hingedly fastened to the said housing between and extending in the same general direction as the base and the grip,
(e) a spring in the housing pressing with one end against the said hammer,
(f) a cap mounted in the housing and engaging the other end of the spring,
(g) means connecting the housing and the cap to lock the cap in one of a plurality of accurately-spaced positions relative to the housing for the selection of spring pressure and hammer force,
(h) a lever mounted in the housing for pivotal movement about one end,
(i) a lifter pivotally mounted on the other end of the lever and having a hook at one end for engagement with the hammer, and
(j) a roller mounted on the actuating trigger and engaging the lever between the ends.

3,275,213
CONTROLLED STOCK FORMATION
Richard F. Reifers, New Canaan, Conn., assignor to Diamond International Corporation, a corporation of Delaware
Original application Mar. 18, 1964, Ser. No. 352,787. Divided and this application Aug. 11, 1965, Ser. No. 489,451
2 Claims. (Cl. 229—2.5)



1. In an egg carton molded of pulp comprising a cover portion and a bottom portion having cells therein adapted to hold the eggs, said bottom portion having an upstanding separator post between said cells adapted to engage the under surface of the cover portion when the carton is closed, the improvement wherein the upper portions of said separator posts have a uniformly lesser effective thickness of pulp and weight per square inch than the remaining portion of said carton whereby the denesting resistance of said carton is reduced.

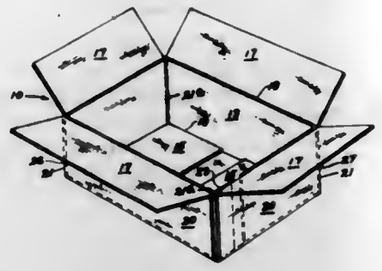
3,275,214
CONTAINERS AND CLOSURES THEREFOR
Pasquale S. Carangelo, West Haven, Conn., assignor, by direct and mesne assignments, of one-third to Alfred Celentano, New Haven, Conn., and one-third to Anthony P. Dello, Hamden, Conn.
Filed May 28, 1964, Ser. No. 370,867
7 Claims. (Cl. 229—17)



1. A blank for producing a quadrilateral container comprising four attached body panels, said body panels separated from each other by at least one crease line, a bottom sealing flap means coupled to said body panels, said bottom flap separated from the body panels by a crease line, a top pouring flap coupled to one of said body panels, said top flap including a rectangular member having one side separated by a first crease line from said one of said body panels, and a second crease line parallel to and spaced apart from said first crease line, three flange flaps coupled to the three other sides of the rectangular member and separated from said rectangular member by crease lines, two of said three flange flaps only extending from the second crease line to the crease line separating the third of said flange flaps from the rectangular member.

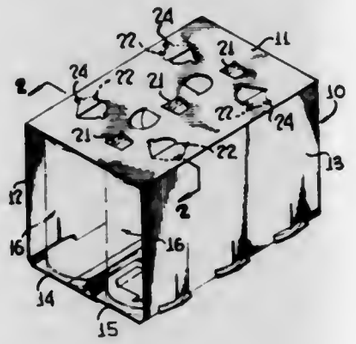
3,275,215
CONTAINER
Richard E. Paige, New York, N.Y., assignor to The Paige Company Containers, Inc., New York, N.Y., a corporation of New York
Filed May 18, 1965, Ser. No. 459,521
6 Claims. (Cl. 229—31)

1. A unitary structure for folding into an open tray, comprising a single blank of rigid but foldable paperboard;
a central rectangular bottom panel 1,
side panels 6, 7 hingedly connected to opposite sides of said bottom panel,
end panels 10, 11 hingedly connected to opposite ends of said bottom panel 1 with two slots 4, 5 and 2, 3 adjacent each end hinge,
a double-hinge section comprising a narrow intervening panel, lying adpacent the outer edge of each end panel 10, 11,
an additional end panel 16, 17 lying adjacent the outer hinge of each double-hinge section;
said additional end panel 16, 17 being divided into three sections by two 45° hinges 24, 25, each hinge starting at the juncture of the side edge and inner edge of said additional panel and extending outwardly to terminate at the outer edge of said additional panel, thus forming two generally triangular panels, each of which has a tab 20, 21 and 22, 23 extending therefrom;
two-panel web sections 29, 30, 31, 32 hingedly connecting one side of each end panel 10, 11 to the corresponding side of a side panel 6. 7, said web comprising a generally triangular panel 37, 38, 39, 40 hingedly connecting the side panel to a central 45° hinge 33, 34, 35, 36, and the second web panel connecting the side of the end panel 10, 11 to said 45° hinge;
all four web sections 29, 30, 31, 32 being offset inwardly of the corners of the bottom panel 1 to space the hinges defining the sides of the side panels inwardly from the end panel;
the connected side 6,7 and web panels 29, 30, 31 32 being folded over to a position overlying their adjacent bottom and end panels, and the additional end panels 16,17 being folded over to overlie the folded-over webs;
the inner surface of each additional end panel being adhesively fastened to the outer surface of each extended web panel, to form a prefolded, unitary structure which can be erected into an open paperboard tray.



3,275,216
CONTAINER
Raymond L. Collins, Brevard, N.C., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Filed June 1, 1964, Ser. No. 371,343
6 Claims. (Cl. 229—37)

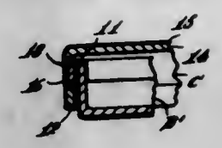
1. A container including two pairs of side walls, the walls of each pair being substantially parallel, and at least one closure flap extending from the same end of each of said side walls,
each said flap having an edge substantially perpendicular to an another edge disposed at an acute angle to its line of juncture with its side wall,
whereby the container cross-section is rectangular, when said perpendicular edges are disposed alongside said side walls, and parallelogram-shaped, when said edges are otherwise disposed.



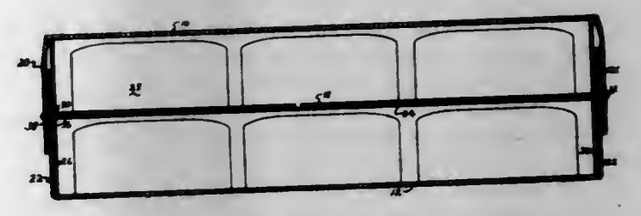
3,275,217
BOX WITH LAMINATED CORRUGATED COLLAR
Clinton L. Dornbush, Palo Alto, and Ward H. Francillon, San Jose, Calif., assignors to Georgia-Pacific Corporation, Portland, Oreg., a corporation of Georgia
Filed Nov. 25, 1964, Ser. No. 413,818
2 Claims. (Cl. 229—37)

1. A box comprising a parallelepipedon box of double-faced corrugated paper which side walls and top and bottom flaps and a double-faced corrugated paper collar the same height as said walls and of the same perimeter as that of the walls and glued to said walls,
said strip being offset relative to the ends of the side

walls of said box, to provide a short flap bridging across the end edges of the box side walls and closing the edges of said box.



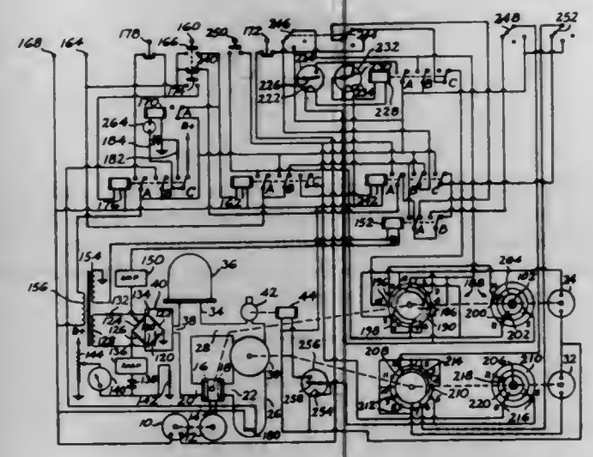
3,275,218
CARTON
Robert H. Ganz, Bergenfield, N.J., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed June 26, 1964, Ser. No. 378,346
17 Claims. (Cl. 229—40)



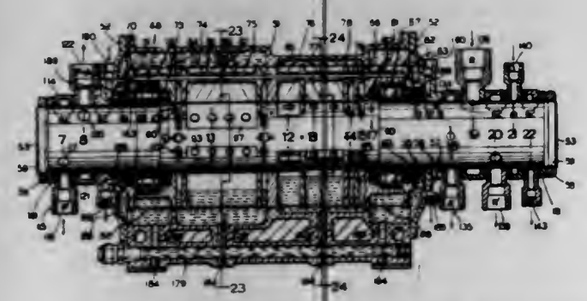
1. In a carton having an interior for receiving cans, a carton panel adapted to oppose ends of cans, a can locking tab struck from said carton panel and hingedly connected thereto along one edge of said locking tab, said locking tab being reversely folded relative to said carton panel into the interior of the carton and having means for reception within a recessed can end and engagement with a seam of the can to limit movement of the can relative to the carton, and means entirely within the limits of said carton panel and independent of a can locking said locking tab in its folded position.

3,275,219
SELF-LOCKING BOX
William H. McKechnie, Northboro, Mass., assignor to Dennison Manufacturing Company, Framingham, Mass., a corporation of Nevada
Original application Aug. 5, 1964, Ser. No. 387,606. Divided and this application June 14, 1965, Ser. No. 463,502
4 Claims. (Cl. 229—45)

1. A self-locking box comprising inner and outer cup-shaped parts which telescope together with the edge of the inner part inside the outer part and the edge of the outer part outside the inner part, an internal shoulder on one side of the outer part facing away from said edge of the outer part, and a flap on the corresponding side of the inner part having its free end directed away from said edge of the inner part to engage behind said shoulder when the parts are telescoped together, the outer part having a depressible portion opposite said flaps so that the flap may be disengaged from said shoulder by pressing inwardly on the said portion to unlock the box, the inner part comprising a layer of material covered with sheet material which bends easily, said sheet material extending across the junction between said flap and inner part and being secured to both the flap and inner part on opposite sides of the junction, said layer having a cut along said junction to facilitate folding the flap outwardly with said sheet material serving as a hinge.

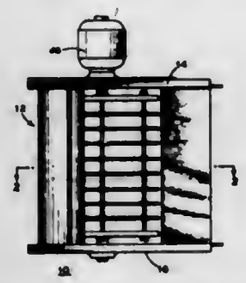


3,275,220
BAKERY BOXES
Loy O. Hubbard, 3601 37th St., Lubbock, Tex. 79413
Filed Mar. 25, 1965, Ser. No. 444,937
7 Claims. (Cl. 229—47)



1. In a box made of stiff pasteboard with natural springiness, said box having,
(a) a top, bottom, and two sides,
(b) on each end of the box a top flap hinged to the top, a bottom flap hinged to the bottom, and a side flap hinged to each of the sides.
(c) the side flaps being the same width as the sides so that when they are closed before the top and bottom flap they give rigidity to the box, and
(d) a center divider extending in a plane parallel to the top and bottom and half-way therebetween,
the improvement comprising:
(e) a bolt attached to the end of edge of the center of the divider and extending inwardly along the divider,
(f) a hole in the bottom flap so that when it is folded up, before the top flap is folded down, the bolt protrudes through the hole, and
(g) a female connector attached in the top flap,
(h) said female connector having a keyhole opening with a circular portion and a slot portion therein,
(i) the keyhole opening arranged so that when the top flap is closed the slot portion has its longitudinal axis vertical and is below the circular portion within the female connector,
(j) said bolt extending through said female connector and resting at the bottom of the slot so that the female connector with the bolt results in additional transverse rigidity to the box by preventing the top flap from moving relative to the bolt attached to the divider, and
(k) a head on the end of the bolt to prevent the top flap from opening,
(l) said head being rounded,
(m) said female connector having an inward depression thereon to direct the rounded head of the bolt through the circular opening thereof.

3,275,221
AUTOMATIC HIGH VACUUM SYSTEM
Thomas J. Holce, Forest Grove, Oreg., assignor, by mesne assignments, to Varian Associates, Palo Alto, Calif., a corporation of California
Continuation of application Ser. No. 132,614, Aug. 21, 1961. This application May 27, 1965, Ser. No. 459,231
10 Claims. (Cl. 230—2)

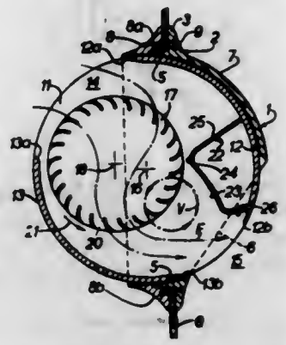


1. A vacuum system comprising a diffusion pump provided with an inlet, a mechanical vacuum pump bypass conduit communicating with said inlet, a mechanical vacuum pump backing conduit communicating with the diffusion pump, a mechanical vacuum pump communicating with the bypass and backing conduits, bypass valve means in the bypass conduit, backing valve means in the backing conduit, electrically actuated drive means operatively engaging the bypass and backing valve means, valve means in the diffusion pump inlet, electrically actuated drive means operatively engaging the diffusion pump inlet valve means, and electrical timer means operatively associated with the bypass and backing valve drive actuator means for controlling operation of the latter to open and close said valve means alternately on a predetermined time sequence when the pressure in said inlet is elevated above a predetermined value.

3,275,222
ROTARY LIQUID PISTON MACHINES
Andre J. Meyer, 848 N. Jackson Drive, Fayetteville, Ark. 72701
Filed Jan. 11, 1965, Ser. No. 424,581
15 Claims. (Cl. 230—116)

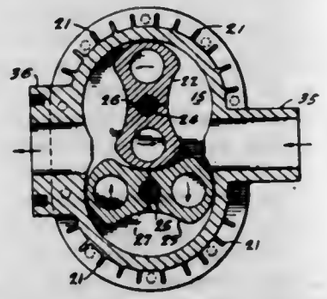
1. In a liquid piston machine a combustor and a unitary structure comprising a plurality of pumps and motors including an air pump, a mixture pump and a product gas motor interposed between two air motors, said pumps and motors having individual rotors coaxially connected to each other and adapted for rotation about a stationary member, means for taking the influx to the air pump out of the atmosphere and for feeding a mixture of fuel and air to the mixture pump, means for delivering the compressed efflux of said mixture pump and part of the compressed air issuing from said air pump to said combustor, means for supplying the outflow of the combustor to the product gas motor and part of the compressed air to the air motor and means for discharging the exhaust gas of said motors into the atmosphere.

3,275,223
FLUID MOVING MEANS
Andrew J. Fowell, South Bound Brook, N.J., assignor to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed Aug. 3, 1964, Ser. No. 386,857
5 Claims. (Cl. 230—125)



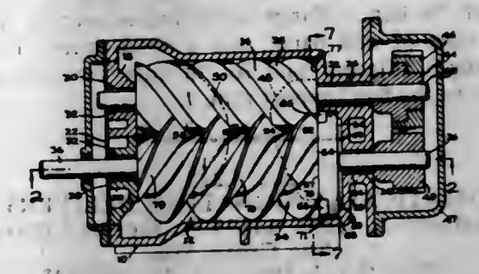
1. A shear force crossflow gas mover comprising, end plates, a plurality of annular members including inner and outer edge portions positioned between said end plates, means for supporting said members in axially spaced relationship to form a rotor having an elongated centrally located completely unobstructed cylindrical cavity defined by the inner edge portions of said annular members, said annular members being spaced from each other sufficiently close to exert a shear force on the gas between the surfaces of said members, a housing surrounding said rotor and forming for said rotor an inlet and an outlet, the cross-sectional area of said inlet being greater than the cross-sectional area of said outlet, said housing including a first wall portion smoothly diverging from said rotor in a direction from the inlet to the outlet, the portion of said first wall portion adjacent said inlet being a rolled back lip member, a second wall portion spaced from said rotor and extending from said outlet to said inlet in the direction of rotation of the rotor, said second wall portion including a portion smoothly and continuously converging toward said rotor in the direction from said outlet to said inlet and portions separating said inlet from said outlet comprising surface members which converge as the distance from said rotor increases, and means for rotating said supporting means in said housing so that all of said members rotate about a common axis of rotation aligned with said elongated cylindrical cavity to cause the shear force exerted on the gas to establish a whirling body of fluid having an axis of rotation parallel to and displaced from the axis of rotation of said annular members and angularly positioned between said inlet and said outlet in the direction of rotation of said rotor.

3,275,224
VENTILATING FANS
Edmund Helmuth Bush, Taplow, England, assignor to Firth Cleveland Limited
Filed Mar. 2, 1965, Ser. No. 436,555
Claims priority, application Great Britain, Mar. 4, 1964, 9,227/64; Oct. 16, 1964, 42,379/64
9 Claims. (Cl. 230—125)



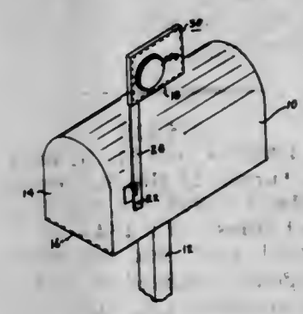
1. A ventilating fan of the cross-flow type comprising an outer structural unit adapted to be fixed in position; an inner structural unit mounted for rotation with respect to the outer unit about an axis fixed in relation thereto; and a motor-driven bladed cylindrical cross-flow rotor mounted for rotation in predetermined direction about an axis parallel to and spaced from the rotational

axis of the inner unit and fixed in relation thereto; said units providing openings opposite the rotor and to either side of the outer unit in both of a first and a second angularly spaced position of the inner unit, first and second guide walls extending the length of the rotor; rotor and guide walls co-operating in each of said positions of the inner unit to set up a vortex having a core region eccentric of the rotor axis and adjacent the first guide wall and to thereby induce a flow of air from one open-



ing through the path of the rotating blades of the rotor to the interior of the rotor and thence again through the path of the rotating blades to the other opening; rotation of said inner unit between said two positions changing the orientation of said guide walls relative to the rotor whereby to reverse the direction of flow between said openings; and the rotational axis of the rotor being spaced to one side of that of the inner unit with the first guide wall to the other side of the latter axis.

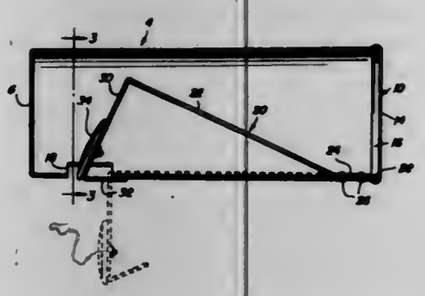
3,275,225
FLUID COMPRESSOR
Forrest O. E. Schultz, Owosso, Mich., assignor to Midland-Ross Corporation, Cleveland, Ohio, a corporation of Ohio
Filed Apr. 6, 1964, Ser. No. 357,561
8 Claims. (Cl. 230—141)



1. In fluid compressor apparatus comprising, in combination: wall means defining a compressor chamber having an inlet for fluid to be compressed and an outlet for compressed fluid; a pair of rotatable lobed rotors disposed within the chamber on spaced axes; and means for rotating the rotors in unison in opposite directions; and characterized in that each rotor comprises a plurality of lobes of substantially epicycloidal configuration and an equal number of recesses of substantially hypocycloidal configuration alternated between successive lobes, wherein each epicycloidal lobe is generated by a point on the circumference of a rolling circle of a diameter not greater than A rolling on a portion of the exterior of a base circle of a diameter B and wherein each hypocycloidal recess is generated by a rolling circle of a diameter not less than A rolling on an inside adjacent portion of the same base circle, in which A is determined by the formula $A=B/2N$ where N is equal to the number of lobes; and further characterized in that the spacing between rotor axes is equal to B.

3,275,226
THRUST BALANCING AND ENTRAPMENT CONTROL MEANS FOR SCREW TYPE COMPRESSORS AND SIMILAR DEVICES
Joseph E. Whitfield, P.O. Box 325, York, Pa.
Filed Feb. 23, 1965, Ser. No. 434,294
11 Claims. (Cl. 230—143)

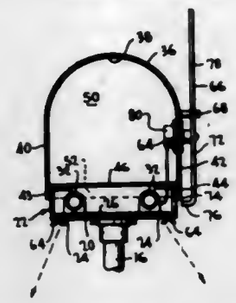
1. In a fluid compressor or similar device of the type having a housing forming intersecting cylindrical rotor chambers, a suction port and a discharge port arranged diagonally opposite each other in the rotor chamber side walls adjacent the end walls of said housing, and a plurality of complementary helically threaded rotors rotatably supported within said rotor chambers and cooperating with each other and the chamber walls to form pockets at the suction end of the rotors for receiving fluid through said suction port, to advance said pockets and the fluid therein axially along the rotors and to discharge the fluid from said pockets through said discharge port as said rotors revolve about the axes thereof, and wherein said pockets become sealed before running out after normal communication between the pockets and the discharge port is cut off, means for venting directly to the discharge port the fluid trapped in said sealed pockets comprising a control disc fixed to one of said rotors at the discharge end thereof having a cylindrical peripheral surface which rotates in sealing relationship with a surrounding surface fixed relative to the end wall of the housing adjacent the discharge port, an opening in said surrounding surface leading to said discharge port, and a plurality of venting passages in said disc opening to the peripheral surface thereof through which the fluid trapped in said sealed pockets may escape to the discharge port when the ends of said passages in the peripheral surface of the disc are in communication with the opening in the surrounding surface.



3,275,227
MAIL BOX SIGNAL DEVICE
Leonard E. Bogue, 18340 Cleveland Road, South Bend, Ind.
Filed Mar. 1, 1963, Ser. No. 262,074
4 Claims. (Cl. 232—34)

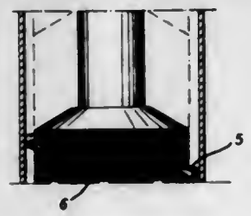
1. A signaling device for a mail box having a rectangular flag and a support arm therefor extending from the lower corner thereof, comprising a rectangularly-shaped front panel of aluminum being substantially the same size as the flag and having a round hole therethrough, a

flange on the front edge of said hole around said hole, a reflector unit of glass with a radially extending flange means at the rear periphery thereof for engaging said first mentioned flange on the internal side thereof for retaining said reflector unit in said hole, flanges along three adjoining edges overlapping the rear side of said panel but spaced therefrom for embracing the respective edges of the flag, a flange extending outwardly from the fourth edge of said panel, and a notch means in one of said flanges adjacent said fourth edge corresponding in position to the flag support arm.



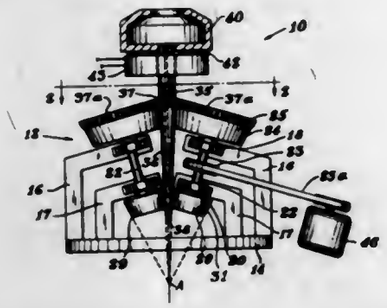
3,275,228
AUTOMATICALLY SIGNALING DELIVERY BOX
Anthony A. Golla, 14875 W. Froedtert Drive, Elm Grove, Wis.
Filed Oct. 2, 1964, Ser. No. 401,037
1 Claim. (Cl. 232—34)

In combination, a rural newspaper box comprising an elongated tubular receptacle closed at a rearward end and open at its forward end and adapted for slidably receiving and retaining therein a newspaper, said receptacle having a bottom wall provided adjacent the closed end of the receptacle with a delivery indicating signal opening, an elongated leaf spring located within the confines of said receptacle and having a forward end secured to said bottom wall and its body portion normally inclining upwardly and rearwardly toward said closed rear end and adapted to be cammed and pressed downwardly when a newspaper is inserted into the receptacle, the rear end portion of said spring having an angularly bent downwardly directed angular member aligned with and projectable and retractible relative to said opening, said angular member being provided with a reflective surface normally confined within the receptacle and projectable through and beyond the opening when a newspaper has been fully deposited in said receptacle, the lower end of said angular spring member being bent to provide a laterally directed exteriorly arranged terminal portion providing a limit stop, said limit stop, by reason of the inherent resiliency of said leaf spring, being normally engaged with said bottom wall and serving to govern travel of the signaling and reflective surface through said opening into said receptacle.



3,275,229
ILLUMINATED MAIL BOX
William G. Turner, 23 Hill St., Orono, Maine
Filed May 17, 1965, Ser. No. 456,165
4 Claims. (Cl. 232—34)

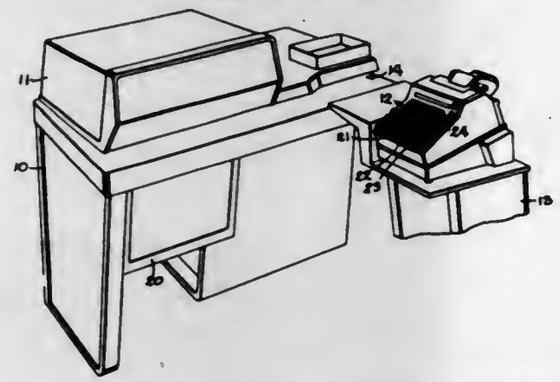
1. An illuminated mail box comprising a support frame, and a receptacle mounted on said support frame, means removably mounting said receptacle on said support frame, said support frame comprising a substantially sealed compartment through which light rays will penetrate, an electrically energized light source contained in said substantially sealed compartment, said receptacle comprising a housing having a door control panel controlling access to the interior thereof, and a signal flag pivotally mounted on said housing and having an upper flag portion positionable above the upper portion of said housing, said support frame comprising a collar member including a lower transparent closure panel defining a



bottom of said compartment, said housing having a lower peripheral portion draping over the upper edges of said collar and including a bottom wall overlying and forming the upper limits of said substantially sealed compartment.

3,275,230
BOWL CENTRIFUGE
Georg Hiller, Vilsbiburg, Lower Bavaria, Germany, assignor to Flottweg-Motorenwerk Dr. Georg Bruckmayer, Vilsbiburg, Lower Bavaria, Germany
Filed July 27, 1964, Ser. No. 385,333
5 Claims. (Cl. 233—7)

1. A bowl centrifuge having a full outer jacket with at least a part thereof being of a conical shape, means for rotatably mounting said jacket, a central supporting member mounted within and rotatable relative to said jacket, a set of disks secured to said supporting member, spiral means removably secured directly to said set of disks and projecting from the outer periphery thereof, and means for rotating said jacket and said supporting member with said disks and said spiral means thereon at different speeds.

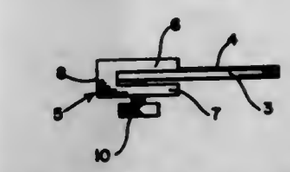


3,275,231
BEARING
Douglas S. Chisholm, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 2, 1964, Ser. No. 335,266
4 Claims. (Cl. 233—24)

1. A bearing assembly comprising a member to be rotated, said member defining a section having a conical surface, said surface being projectable to a point A, at least three rotatably mounted conical segments positioned at about equiangular displacements from each

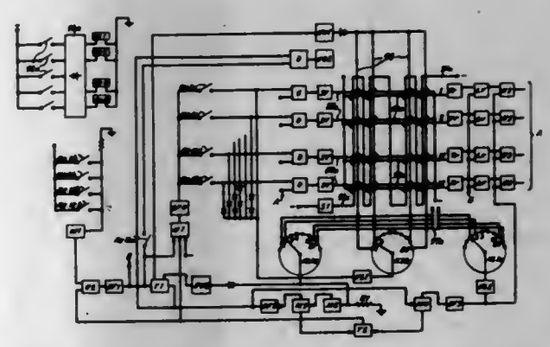
other about said conical portion, each of the conical segments having conical surfaces in the same conical projection which are projectable to the point A and in engagement with conical surface of the conical member to be rotated, rotatable bearing means in cooperative combination with the conical sections, and means to maintain the conical sections in fixed relationship to each other.

3,275,232
PROOF ENCODER AND PERFORATING SYSTEM THEREFOR
James L. Quinn, Chicago, Orville T. Knutson, Libertyville, and William H. Dreyer, Skokie, Ill., assignors to Cummins-Chicago Corp., Chicago, Ill., a corporation of Illinois
Filed Nov. 5, 1963, Ser. No. 321,608
27 Claims. (Cl. 234—1)



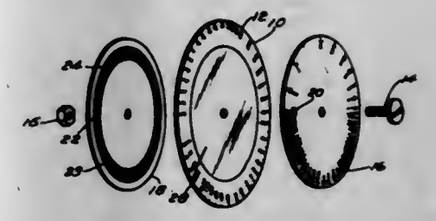
7. In a perforating system for entering information on checks or the like a portion of which have prequalifying information at the leading edge and a portion of which do not have any prequalifying information, the method which comprises transporting a check along a predetermined path of movement, detecting the presence of prequalifying information, relatively positioning the check in a coding station and entering coded information thereon, said check being positioned in the station in a first or second position depending upon the absence or presence of prequalifying information so that the information entered on the check at the station is entered adjacent the prequalifying information and in the lack thereof adjacent the leading edge of the check.

12. In a perforating system for entering information on checks or the like, the combination comprising a perforator having rotatable rings indexable to set positions, means for rotating the rings simultaneously from a home position, said rings having respective magnetic latches, a multiple column keyboard for entering information read from the face of the check, the columns being so coupled to the corresponding and respective magnetic latches that the rings are latched at positions corresponding to the information entered on the keyboard, means for transporting the check to a position in which a clear area on the check is alined with the perforator head, means automatically responsive to arrival of the check and the completion of the setting of the rings for actuating the perforator head, and means for thereafter ejecting the check and resetting said rings to home position in readiness for new instructions from the keyboard.



3,275,233
TAPE PERFORATOR WITH VARIABLE WIDTH TAPE GUIDE ATTACHMENT
Samuel R. Frankel, 412 N. State St., Shillington, Pa.
Filed Dec. 31, 1964, Ser. No. 422,685
6 Claims. (Cl. 234—1)

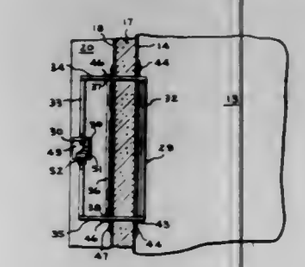
1. In a high speed tape perforator of the class described having a punch block containing a plurality of punch pins that selectively may be actuated to perforate a tape passing therethrough, the improvement comprising a tape guide shoe removably mounted adjacent said punch block



and adapted to engage one margin of said tape in guiding relationship whereby the position of said tape with respect to said punch pins can accurately be controlled.

3,275,234
RECORD CARD PUNCHING MACHINE
Hans Christian Felder, Bad Homburg vor der Hohe, Gerhard Schilling, Steinbach, Taunus, Karl Hermann Johannes Zennig, Frankfurt am Main-Rodelheim, and Klaus Juergen Boehnke, Kelkheim, Taunus, Germany, assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Continuation of application Ser. No. 233,023, Oct. 25, 1962. This application June 15, 1965, Ser. No. 464,249
Claims priority, application Germany, Nov. 4, 1961, R 31,400 R 31,401, R 31,402, R 31,403
27 Claims. (Cl. 234—58)

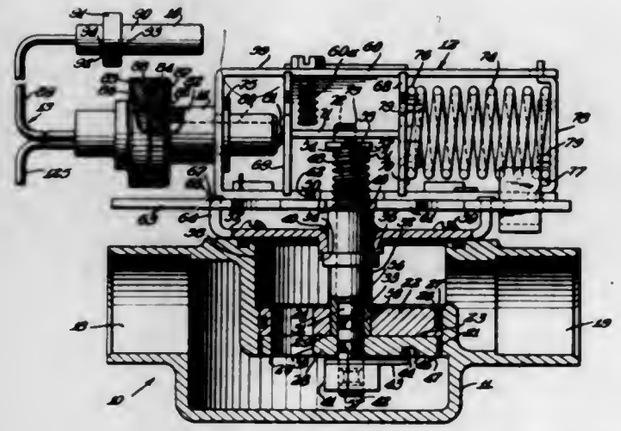
1. In a keyboard controlled machine for punching a record card column by column, a punching mechanism cyclically operable for perforating a record column, means for feeding records through said punching mechanism, a memory having a plurality of addressable locations for storing data entered from said keyboard, means for reading said memory in sequential locations to selectively control the punches of said punching mechanism, and output stepper means coupled to said reading means and said feeding means for driving said feeding means intermittently in steps to advance the card column by column to said punching mechanism in synchronism with the sequential operation of said reading means.



3,275,235
COMPARISON CALCULATOR
George Balch 73 Taber Ave., Providence, R.I.
Filed Sept. 20, 1965, Ser. No. 488,525
7 Claims. (Cl. 235—84)

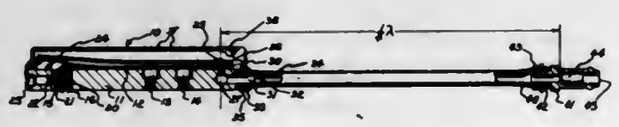
1. A comparison computer comprising a pair of adjacent relatively movable members, each member having thereon graduations in a predetermined progression in

the same direction, a third member having graduations associated with the pair of members and with reference to which the pair of members may each move for adjusting their graduations which are in cooprative relationship with the graduations on the third member, means associated with said pair of members comprising indicia strips on one and indicators in the other in cooperative relationship with said strips, said means being so positioned with reference to said graduations on said pair of members as to visibly and concurrently indicate to the user the comparative results secured by the relative position of said members.



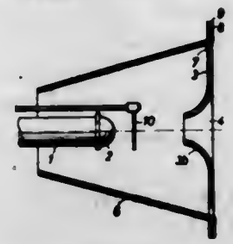
3,275,236
HYDRAULIC THERMOSTATIC SYSTEM WITH SLAVE PISTON ASSEMBLY
Paul R. Staples, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed Dec. 7, 1964, Ser. No. 416,503
5 Claims. (Cl. 236—15)

1. A hydraulic thermostatic system for controlling the heating means of a domestic oven comprising a temperature sensor and a hydraulic temperature responder that are joined together by a fluid-filled capillary tube, the sensor comprising a rectangular frame with a sensing tube a low thermal mass forming one side, a driven tube forming the opposite side, and where the two remaining sides are rocker arms connecting the sensing tube with the driven tube, and a fulcrum rod adjacent the center of the frame and integral at each end with the adjacent rocker arm. and a transducer cooperating with the driven tube and connected to the capillary tube so as to convert variations in the length of the driven tube to variations in the fluid pressure in the capillary tube, the sensing tube being adapted to be positioned within an oven cavity while both the fulcrum rod and the driven tube are adapted to be shielded from the oven temperature and located in the same ambient conditions to render them ambient temperature compensated so that the net effect is that only the sensor tube length is monitored by the driven tube.



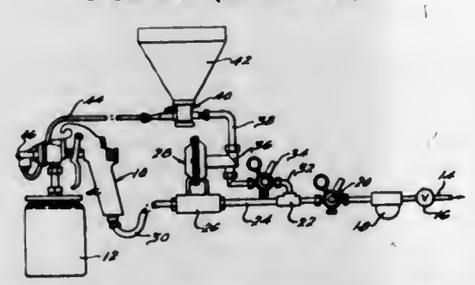
3,275,237
ROTARY SHEAR VALVE WITH REMOTE CONTROL
Lawrence A. Kolze, Bensenville, Ill., assignor to The Dole Valve Company, Morton Grove, Ill., a corporation of Illinois
Filed June 22, 1964, Ser. No. 376,811
5 Claims. (Cl. 236—51)

5. A fluid flow control valve comprising,
a valve body having an inlet, an outlet and a passage communicating said inlet and said outlet, a rotatable valve member and a valve seat in said passage for controlling fluid flow therethrough, an elongated valve stem rotatably mounted on said valve body,
said stem having a first portion extending into said passage and being fixedly connected to said valve member for corotation therewith and having a second portion extending outwardly of said valve body,
a radially extending crank arm fixedly connected to said second portion of said valve stem and having an axially extending pin member formed thereon in axial offset relation with respect to said valve stem,
a force transmitting assembly mounted on said valve body and comprising,
an assembly frame fixedly connected to said valve body,
a pin guide member slidably mounted for translatory movement on said frame and engaging said pin member for imparting rotatable movement to said valve member in response to translatory movement thereof,
biasing means connected to said frame and said guide member for urging said guide member in one direction, and



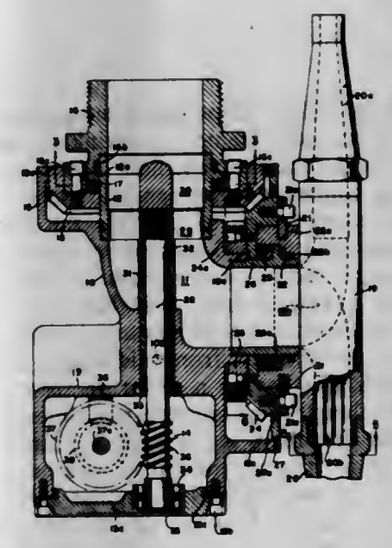
force transmitting means mounted on said frame for urging said guide member in an opposite direction,
temperature sensitive actuating means remote from said valve body,
a first fluid-filled conduit interconnecting said temperature sensitive actuating means and said force transmitting means for actuating said force transmitting means in response to temperature ambient said temperature sensitive means,
manually adjustable actuating means remote from said valve body, and
a second fluid-filled conduit connecting said manually adjustable actuating means and said force transmitting means in parallel with said first conduit for actuating said force transmitting means independent of said temperature sensitive actuating means and in response to manual adjustment thereof.

3,275,238
VIBRATION DAMPING PNEUMATIC CONTROL DEVICE
John D. Nilles, Roselle, Ill., assignor to Honeywell Inc., a corporation of Delaware
Filed Sept. 25, 1964, Ser. No. 399,266
6 Claims. (Cl. 236—87)



6. A pneumatic control device, comprising: condition responsive modulating means including valve means connected to a source of air; said condition responsive means and said valve means operating in response to a condition to be controlled by proportionally valving said air: said condition responsive means and said valve means having a natural resonant frequency of vibration; and tubular chamber means having a length of approximately one-quarter the wave length of said natural resonant frequency connected to said valve means and said source wherein vibrational waves generated by said valve means pass into said tubular chamber means and are reflected back to said valve means out of phase with said generated waves to damp out said vibrations.

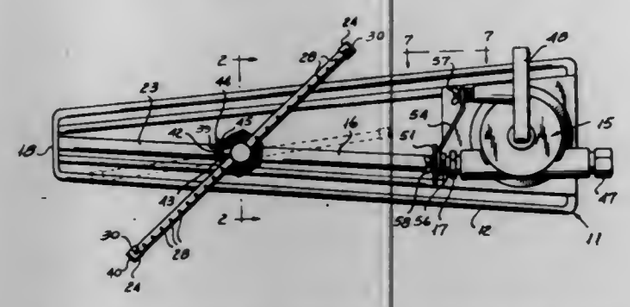
3,275,239
APPARATUS FOR THE ELECTROSTATIC PRECIPITATION OF COATING MATERIAL
Kurt M. Oesterle, 88 Goldbacherstrasse, Kusnacht, Zurich, Switzerland
Filed Aug. 27, 1963, Ser. No. 304,860
10 Claims. (Cl. 239—15)



1. Apparatus for electrostatic precipitation of coating material onto a base, comprising a spraying device, means for generating an electrostatic field between the spraying device and the base, said spraying device including a jet spraying member, a rotatable edge spraying element positioned downstream with respect to the jet spraying member, said edge spraying element being provided with a receiving surface adapted to be impinged by the coating material discharged from the jet spraying member, said receiving surface having a central opening and being connected with a spray edge, and means for varying the ratio between the amount of coating material delivered by the jet spraying member and impinging on the said receiving surface, and the amount passing through said central opening of the edge spray element.

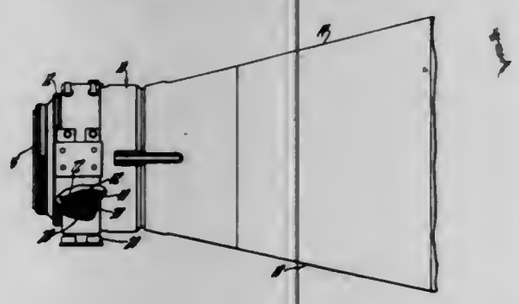
3,275,240
SPRAY APPARATUS
Robert L. Peaslee, Royal Oak, and Clifford C. Tennenhouse, Southfield, Mich., assignors to Wall Colmonoy Corporation, Detroit, Mich., a corporation of Delaware
Filed Jan. 3, 1964, Ser. No. 335,502
3 Claims. (Cl. 239—61)

1. A spray apparatus for forming a composite spray of gas-propel ed liq:id globules and solid particles comprising a first nozzle, supply means for supplying a pressurized gas to said first nozzle, means for supplying a liquid to said first nozzle in a manner to effect atomization thereof and d:scharge from said first nozzle in the form of a gas-propelled spray of fine-sized liquid globules, a second nozzle, means for supplying a finely-particulated solid powder including gas-actuated means for fluidizing and d scharging said powder at a controlled rate to said second nozzle into said spray from said first nozzle effecting entra nment of said powder in said spray, a conduit connected to said gas-actuated means and to said supply means, an orifice in said supply means, sensing means for sensing the pressure drop across said orifice in response to the flow of gas therethrough to said first nozzle, first valve means in said conduit operatively associated with said sensing means and movable to an open position when a preselected pressure drop is exceeded enabling passage of gas to said gas-actuated means and movable to a closed position preventing passage of gas to said gas-actuated means when the pressure drop is below the preselected level, and second valve means for controlling the rate of flow of gas to said first nozzle.



3,275,241
APPARATUS FOR CLEANING TANKS
Michel A. Saad, 2676 Newhall St., Apt. 31, Santa Clara, Calif.
Filed Oct. 18, 1965, Ser. No. 497,423
8 Claims. (Cl. 239—227)

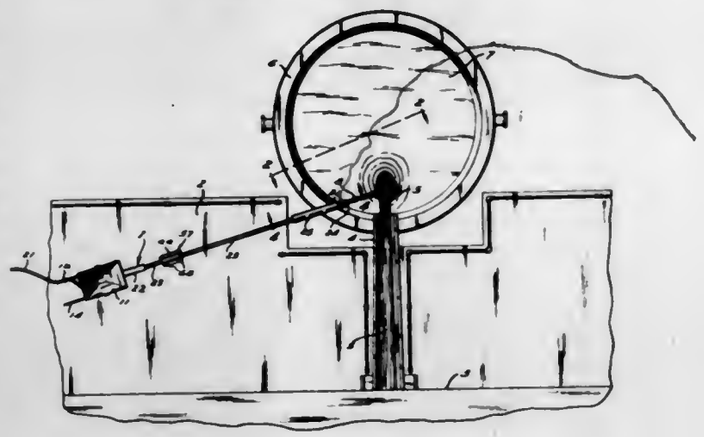
1. Apparatus for washing the interior of a ship tank and the like, said apparatus being adapted to be suspended in the tank by a fluid supply conduit, comprising the combination of a housing having a curved main cavity, said main cavity having an inlet and an outlet, stationary coupling means having one end connected to a fluid supply conduit, means including a first thrust bearing means rotatably supporting said housing on said coupling member so that said coupling member is connected to said inlet of said rotatable housing, said coupling means having a bevel gear attached thereto, said bevel gear engaging said first thrust bearing means, cleaning fluid nozzle means including a nozzle head, means including a second thrust bearing means for rotatably supporting said nozzle means on said outlet of said housing, a second bevel gear associated with said nozzle head and meshing with said first mentioned bevel gear, said housing having means engaging the peripheral portions of said bevel gears providing bearing surfaces for said bevel gears, clutch means responsive to hydraulic pressure in said cavity, said clutch means coupling said nozzle head to said second bevel gear, said clutch means comprising a member attached to said second bevel gear engaging said nozzle head on the outside thereof, and means responsive to fluid flowing through said cavity rotating said nozzle head with respect to said housing and said housing with respect to said coupling means, said means responsive to fluid flow including said bevel gears and said clutch means, said bevel gears having different predetermined numbers of teeth so that the jets of cleaning fluid directed from said nozzles against the interior surfaces of said tank progressively impinge on different areas of said tank surfaces as said nozzle means is rotated with respect to said housing and said housing



is rotated with respect to said coupling means so that the entire surface of said tank is covered with cleaning fluid during a cycle of operation.

3,275,242
LAWN SPRINKLER
Seth Waldo Thompson, 9 Gordon Road, Essex Fells, N.J.
Filed Jan. 9, 1964, Ser. No. 336,709
4 Claims. (Cl. 239—227)

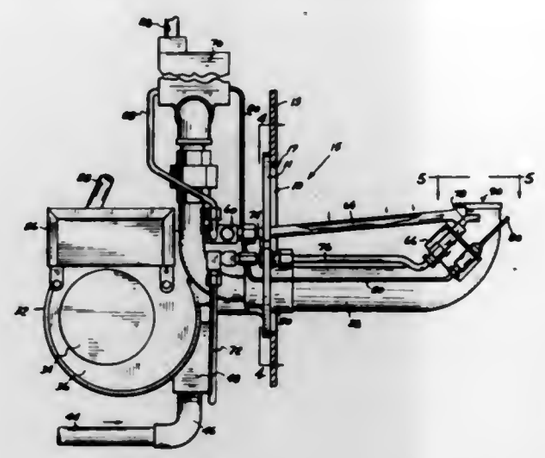
1. A lawn sprinkler comprising a supporting frame, a water motor on said frame, a sprinkler supply pipe mounted on said frame to oscillate about a horizontal axis, a driving connection between said water motor and said sprinkler supply pipe to oscillate the latter, and a sprinkler comprising a head carried by said supply pipe and connected to receive water therefrom and to rotate thereon about a vertical axis, said head having hollow arms extending therefrom at angles to said axis of rotation of the head to receive water from said supply pipe through said head, each arm having a series of apertures spaced apart along its length and adapted to discharge water in directions such that there is no tendency for the head to turn, providing for the adjustment of said head with said hollow arms at a predetermined angular relation to the axis of head rotation and to the axis of said supply pipe oscillation, and means for causing rotation of said head and arms, when desired, comprising another aperture in at least one arm adjacent its outer end and directed at an angle to said plane of the axis of head rotation, and means on said arm for selectively opening and closing said other aperture.



3,275,243
EXHAUST NOZZLE FLUID SEAL
Arthur W. Gaubatz, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 28, 1961, Ser. No. 164,212
5 Claims. (Cl. 239—265.35)

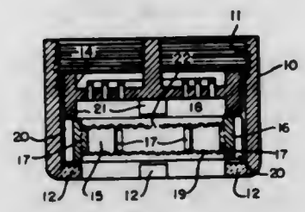
1. An expandable seal member for use between two spaced surfaces comprising a plurality of thin plates each having a width narrow in comparison to its length, said plates being stacked together face to face and positioned as a group between said surfaces with their opposite edges contacting said surfaces, said plates each being corrugated in a diagonal direction with respect to the length and width of each plate, the inclination of said corrugations permitting expansion of each of said plates simultaneously in directions along both their length and width, the spaces between said corrugations being filled with an elastomer binding said plates together.

3. A vectoring fluid jet propulsion nozzle, having vectoring and stationary portions and a fluid leakage passage therebetween, and an expandable heat dam and fluid seal ring in said passage between said portions to prevent the leakage of heat and fluid along said passage, said ring comprising a plurality of thin annular plates extending around one of said surfaces and across the space between said surfaces, sealingly contacting said surfaces, said plates being axially stacked one against the other, each of said plates being corrugated in a generally radial direction, the corrugation of each plate being inclined with respect to a radial line from the axis of said plate through the said corrugation, said inclination permitting the expansion of each of said plates simultaneously in both a radial and circumferential direction to seal said ring member against said surfaces.



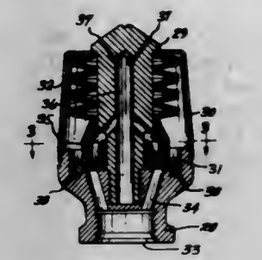
3,275,244
APPARATUS FOR INTRODUCING ADDITION AGENT INTO A MELT
John W. Brown, Jr., Lakewood, Ohio, and Arthur C. Buesing, Milwaukee, and Francis T. Kaiser, Port Washington, Wis., assignors to Brown Fintube Company, Elyria, Ohio, a corporation of Ohio
Original application Jan. 31, 1962, Ser. No. 170,204, now Patent No. 3,224,051, dated Dec. 21, 1965. Divided and this application Mar. 2, 1965, Ser. No. 436,462
5 Claims. (Cl. 239—345)

1. A gun for discharging a stream of particles of solid material, comprising a body member having an elongated passage; an orifice opening into said passage and adapted to communicate with a source of propellant fluid under pressure and to discharge propellant fluid into said passage; a particle feed conduit opening laterally into said passage and adapted to communicate with a supply of particles; and a return conduit one end of which opens into said feed conduit and the other end of which opens into said passage of said body member at a location downstream from said orifice and from the opening of said feed conduit into said passage.



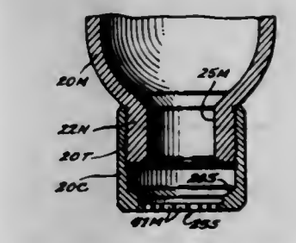
3,275,245
BURNER ASSEMBLY
Bennett J. Moore, Detroit, Mich., assignor to Magic Servant Products Company, Detroit, Mich., a corporation of Michigan
Filed Aug. 21, 1964, Ser. No. 391,140
20 Claims. (Cl. 239—399)

1. A burner assembly, comprising
(a) an air blower assembly,
(b) a gas delivery line,
(c) a mixing tube disposed within the combustion chamber of a furnace,
(d) a splitter member mounted within an opening in the wall of said combustion chamber to receive said air and gas respectively from said blower assembly and gas line externally of said combustion chamber,



said splitter member delivering said gas and a preset proportion of said air to said mixing tube regardless of the volume of air delivered from said blower assembly, the remainder of said air being delivered to said combustion chamber externally of said mixing tube.

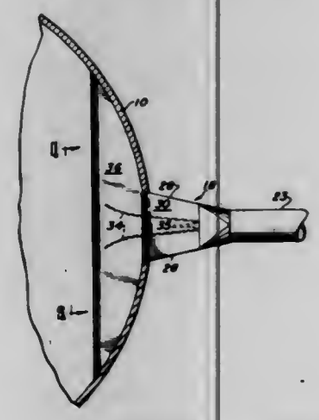
3,275,246
AERATORS WITH ENLARGED STREAM OUTLETS
Elie P. Aghnides, 46 W. 54th St., New York, N.Y.
Continuation of application Ser. No. 317,894, Oct. 22, 1963. This application Mar. 16, 1966, Ser. No. 534,915
6 Claims. (Cl. 239—428.5)



6. A mixing unit for a water aerator comprising a substantially cylindrical supporting member, a mesh screen, and means for retaining said screen within said supporting member in such manner that substantially the entire area of said screen is free for the flow of water therethrough, said retaining means comprising a plurality of spaced projections extending inwardly from the inner surface of said supporting member in a locus around the axis of said supporting member, spaced peripheral portions of said mesh screen being partially embedded in said projections, the intermediate peripheral portions of said screen located between said projections being free for the flow therethrough of water, the inner surface and extremities of said cylindrical supporting member being substantially flush with one another adjacent said intermediate peripheral screen portions thereby to avoid any overhang from said supporting member tending to restrict the flow of water through said intermediate peripheral screen portions, said projections being of thermoplastic material with a lower melting point than that of the mesh screen whereby the mesh screen may be partly embedded in or removed from said projections by application of induction heating.

3,275,247
CONTROLLABLE JET NOZZLE PIPE CLEANING DEVICE
Paul Hammelmann, 17 Zum Sundern, Oelde, Germany
Filed Jan. 11, 1965, Ser. No. 424,607
Claims priority, application Germany, Feb. 1, 1960, H 38,544, Patent 1,165,945; Mar. 11, 1960, H 38,886; Mar. 16, 1960, H 38,925
11 Claims. (Cl. 239—447)

1. Cleaning nozzle mechanism comprising a conduit for supplying fluid under pressure, a nozzle head mounted on said conduit and having first jet means and second jet means at spaced locations in said nozzle head and directed in generally opposite directions, respectively, and further having first and second valve elements spaced apart, and control means having first and second valve elements spaced apart and cooperable with said first and second nozzle head valve elements, respectively, by reciprocation of said control means with respect to said nozzle head between a first position in which engagement of said two first valve elements blocks communication between said conduit and said first jet means while said second jet means are in communication with said conduit and a second position in which engagement of said second two valve elements blocks communication between said conduit and said second jet means while said first jet means are in communication with said conduit, and said control means further including pressure-receiving surface means upon which pressure is exerted by fluid under pressure from said conduit for creating a force effecting relative reciprocation of said control means and said nozzle head.

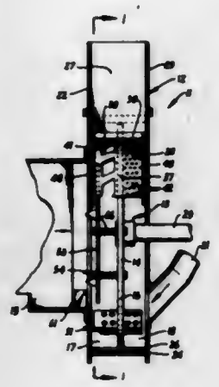


3,275,248
MODIFIED FULL CONE NOZZLE
Edward J. O'Brien, Glen Ellyn, and Robert P. Williams, Naperville, Ill., assignors to Spraying Systems Co., a corporation of Illinois
Filed Aug. 7, 1964, Ser. No. 388,137
2 Claims. (Cl. 239—487)

1. In a full cone spray nozzle of the character described, a nozzle body having an elongated generally cylindrical internal chamber therein, one end of which chamber constitutes an inlet end through which liquid may pass into said chamber, vane means disposed in said chamber adjacent to said inlet end for imparting swirling and turbulent motion to liquid advancing through said chamber, said chamber at its other end being gradually reduced in diameter and terminating in an end wall having a discharge orifice coaxial with said chamber, a cap having a skirt portion threaded longitudinally onto the nozzle body and a cross wall spanning said end wall, said cross wall having a central opening larger than and coaxial with said

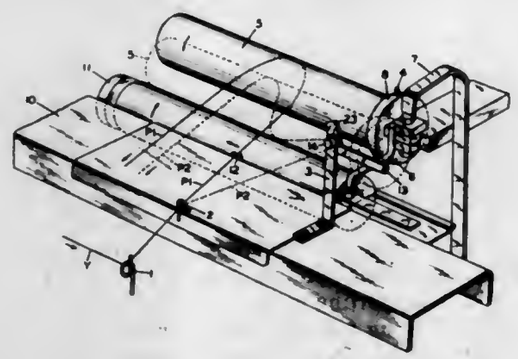
discharge orifice, said central opening having an annular series of grooves formed about its periphery and parallel with the axis of said discharge orifice for engagement by outer portions of a spray issuing from the orifice for directing part of the swirling liquid in droplet form inwardly toward the center of the spray emerging from said orifice.

3,275,249
ENTRANCE NOZZLE FOR FLASHING SUPERHEATED LIQUID
John A. Karoly and Carrel C. Bryant, Chicago, Ill., assignors to Chicago Bridge & Iron Company, Oak Brook (Hinddale P.O.) Ill., a corporation of Illinois
Filed Aug. 20, 1964, Ser. No. 390,951
6 Claims. (Cl. 239—523)



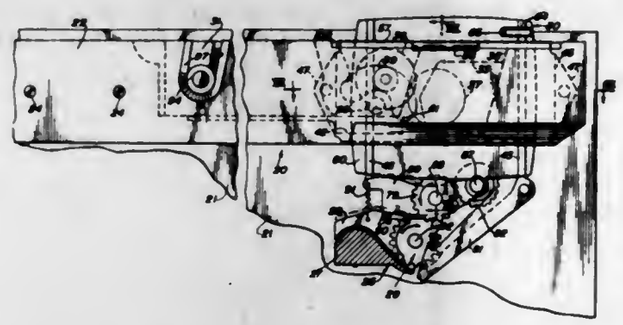
1. In a process vessel having an inlet line for introducing hot fluid to said process vessel operated under a lower pressure and temperature than said fluid, the improvement which comprises:
(1) a nozzle extending from said inlet line and communicating therewith opening to the interior of said vessel, said nozzle having vertical wall sections diverging in the direction of the flow and spaced horizontal wall sections substantially normal to said vertical wall sections thereby forming a rectangular opening in said vessel;
(2) a plurality of vanes extending longitudinally of said nozzle and having arcuate ends terminating within said vessel and having their leading edges tapered, said vanes diverging in the direction of the flow; and
(3) a plate member depending obliquely from the interior wall of said vessel above said vanes and adjacent the opening of said nozzle and having an arcuate terminus, said plate member extending beyond the terminus of said nozzle.

3,275,250
PROCESS FOR MAKING FINE PARTICLES OF NITROCELLULOSE
Mark Plunguian, Newark, Del., assignor to Hercules Incorporated, a corporation of Delaware
No Drawing. Filed Oct. 14, 1963, Ser. No. 316,122
5 Claims. (Cl. 241—21)



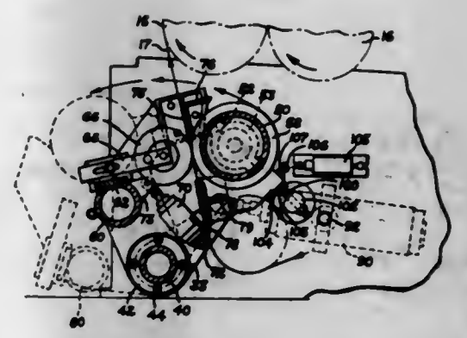
1. A two-stage process for reducing fibrous nitrocellulose to particles no greater than about 5 microns in at least two dimensions and no greater than about 15 microns in any dimension which process comprises subjecting a slurry of the said fibers in a nitrocellulose nonsolvent medium to high impact milling for a time sufficient to reduce the fibers to the form of irregularly shaped agglomerates of about 40 to 200 microns in diameter and thereafter subjecting the agglomerates in the same liquid medium to light dispersing action in the presence of finely divided sand or silica.

3,275,251
DUAL FEED MILL
Eugene D. Thompson, Rte. 7, Box 612, and Joseph E. Whitt, 3013 Shenandoah Way, both of Modesto, Calif.
Filed Feb. 3, 1964, Ser. No. 342,101
12 Claims. (Cl. 241—44)



We claim:
1. A feed mill comprising a housing enclosing a chamber in which materials to be ground are held, a screen in the shape of a section of a circular cylindric surface serving as a wall of said chamber, a rotor mounted for rotation in said housing on an axis substantially in common with the axis of the cylindric surface of the screen and having cutting means acting in cooperation with the screen for pulverizing feed materials, a partioned member on the rotor dividing the chamber of the housing into two compartments, and duct means for supplying feed material into each of the two compartments to effect grinding of the feed materials.

3,275,252
TRANSFER TAIL WINDING
John C. Bolger, Hopewell, Va., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York
Filed June 12, 1964, Ser. No. 374,760
1 Claim. (Cl. 242—18)

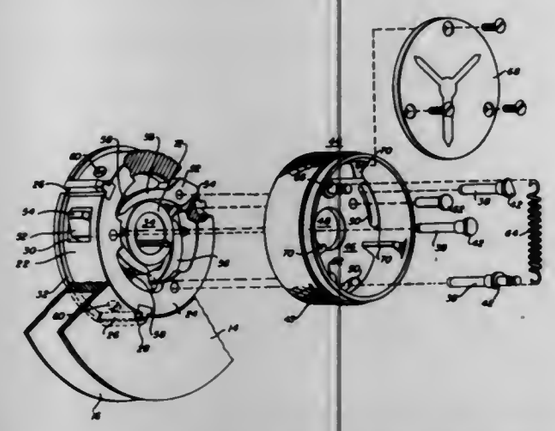


Method for winding a transfer tail and starting the main package on a winding machine carrying a surface driven tube, supported on a freely rotatable spindle and rotated together with said spindle by contact with a print roll which roll cooperates with an open traversing guide, and on which tube a continuously advancing yarn is to be wound; in which the successive steps are
(1) providing an empty tube upon the spindle;
(2) guiding the continuously advancing yarn in a path passing through a fixed point forward of and about opposite the center of the machine, thence through a guide in front of the head end of the tube and higher than the top of the traversing guide and print roll; thence between the tube and the print roll in a path clearing the traverse guide, around the back of the tube, and thence forward over the top of the tube to present a free strand of running yarn which is taken up at a point of temporary collection;
(3) while contacting the tube with the rotating print roll and thereby rotating the tube at surface speed about equal to the linear speed of advance of the yarn, carrying the free strand of running yarn from the top of the tube toward and across the head end of the tube and across the path of a yarn securing element which is being carried in a circular path by rotation of the tube and spindle; securing the free strand of running yarn by said element, and as soon as the strand of running yarn is secured by said element, severing the yarn between said element and said point of temporary collection;
(4) continuing the rotation of the print roll to drive the tube at surface speed equal to the linear yarn speed as the yarn advances from said guide near the head end of the tube, thereby winding the yarn, under the guidance of said guide, around the tube near the head end of the tube and at essentially the linear speed of advance of the yarn;
(5) moving the yarn guide to allow the yarn to slide off and become disengaged from the guide and maintaining sliding contact between the yarn and the guide thereby progressively shortening the path of the yarn between the first mentioned point at front and center of the machine and the point of first contact of the advancing yarn with the print roll, until the yarn drops onto the print roll and is carried without jerking, at the surface speed of the print roll, in a practically straight line path from the first mentioned point, forward from the center of the machine, to the print roll, which path intersects the path of traverse of the traversing guide, into which guide the yarn slides as the traversing guide meets this last yarn path, whereby the main package is wound on a section of the tube spaced from the first formed windings.

3,275,253
MOTION PICTURE PROJECTOR
Jaroslav Cherniavskyj, Skokie, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Jan. 17, 1964, Ser. No. 338,429
22 Claims. (Cl. 242—55.11)

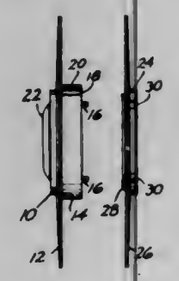
1. A film feeding construction for motion picture projectors comprising, a supporting structure, means on said supporting structure for supporting a film cartridge, a film reel arm carried by the supporting structure, said film reel arm having a reel spindle and gear means for driving the spindle, a driving gear carried by the supporting structure in position to mesh with a core gear of a cartridge, said gear means of the reel arm being disengageably disposed with respect to said driving gear.

3,275,254
SLITTER
Gary B. Du Bois, Fulton, N.Y., assignor to The Black Clawson Company, Hamilton, Ohio, a corporation of Ohio
Filed Mar. 16, 1964, Ser. No. 351,959
3 Claims. (Cl. 242—56.2)



1. In a combined winder and slitter having spaced apart side frame members supporting a pair of drive drums for the peripheral driving of a paper roll wound thereon and a rider roll mounted for general vertical movement on said side members as said wound roll builds up the improvement comprising, a slitter assembly mounted between said side frame members including a pair of spaced apart arms, means pivotally mounting one each of said arms on each of said side members adjacent an inside surface thereof, a rear slitter shaft extending transversely between said arms and rotatably mounted thereon in spaced relation to said pivotal mounting means, rear slitter elements supported on said shaft, a front slitter support tube rotatably mounted on said arms in spaced relation to said pivotal mounting means and to said rear slitter shaft and extending between said arms, a plurality of slitting knives mounted on said front support tube for cooperating engagement with the rear slitter elements, first piston motor means supported on said arms and connected to rotate said front slitter support tube selectively to bring said slitter knives into and out of said cooperating engagement with said rear slitter elements, and second piston motor means connected between said side frame members and said arms for pivoting said arms on said side frame members carrying said slitter assembly between an outer position forward of said drive drums exposing said slitter knives and elements for adjustment and an inner position beneath said drive drums for slitting a web of paper being wound on said drums.

3,275,255
REEL MOUNT
Warren R. Pitts, Needham, Mass., assignor to Honeywell Inc., a corporation of Delaware
Filed Sept. 16, 1963, Ser. No. 308,999
6 Claims. (Cl. 242—68.3)

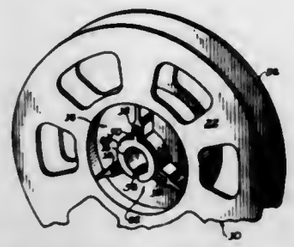


1. A hub for supporting a reel thereon and transmitting rotary power thereto, comprising an outer hub surface slidably adapted to engage a corresponding interior surface of said reel in keyed relationship, a back stop at one side of said hub adapted to abut said reel in its mounted position, a plurality of pivot pins mounted on said hub parallel to the axis of rotation, a handle axially extending from the other side of said hub proportioned to pass through said reel, elongated slots in said handle positioned to receive said pivot pins, said pivot pins and slots cooperating to retain said handle in an axial direction while permitting limited rotational movement thereof with respect to said hub, a cam pivotally mounted on each of said pivot pins including a contact portion, an opening in said outer hub surface

corresponding to each of said cams, mean positioned to one side of each of said pivot pins for resiliently urging the associated cam in one direction, cam follower means adapted to contact each of said cams at said one side of the associated pivot pin to urge said cam in the opposite direction when said handle is rotated in one sense with

respect to said hub, each of said cams being capable of pivotal movement in accordance with the sense of relative handle rotation to position said cam contact portion either in a position retracted within said outer hub surface, or in a protruding position in engagement with said interior reel surface when said reel is mounted.

3,275,256
SECTIONAL TAPE SPOOL CONSTRUCTION
H Albert Campbell, Jr., Portland, and Harold R. Burt, Beaverton, Oreg., assignors, by mesne assignments, to K.W.F. Industries, Inc., a corporation of Washington
Filed Jan. 17, 1964, Ser. No. 338,346
3 Claims. (Cl. 242—71.8)



1. A spool component for mounting in a container comprising

a first spool section comprising a tape mounting cylinder, and a disc joined to one end of said cylinder radiating from the cylinder at said one end, said cylinder, progressing axially from one side of said disc, having a dimension substantially as wide as the tape to be received by the spool component, and

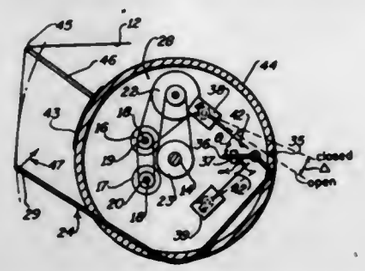
a second spool section comprising an annular disc disposed against the end of said cylinder opposite the cylinder's said one end, and an annular shoulder joined to said annular disc adjacent the inner circumference and on one side thereof, and snugly received within the inside of said cylinder, said shoulder having an inner circumferential margin which is irregularly contoured whereby a driving connection may be established with the spool component through said shoulder,

said first and second spool sections including co-operating means producing a mechanical interlock locking the two sections together for simultaneous rotation, said cooperating means comprising at least one opening in one of the spool sections adjacent the inner circumference of said annular disc and located radially outwardly of said inner circumferential margin of said shoulder, and at least one projection joined to the other spool section located radially inwardly of the outer circumference of the cylinder, which projection is received within said opening.

3,275,257
SPINDLE ADAPTER FOR SUPER 8 SUPPLY REEL
Jaroslav Cherniavskyj, Skokie, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Mar. 1, 1965, Ser. No. 436,053
5 Claims. (Cl. 242—71.8)

1. An adapter for use with a rotatable spindle having a key thereon and a reel having a hub with a spindle opening therethrough, the spindle opening being of a diameter greater than the diameter of said spindle, said hub having a keyway opening into the spindle opening, the adapter comprising:

a substantially cylindrical body portion having a wall thickness of substantially the difference between the exterior diameter of the spindle and the interior diameter of the reel spindle opening;



a restrainer member having at least one portion of greater diameter than said spindle opening formed about an end of said body portion;

key means extending radially outwardly from said body portion to cooperate with said hub keyway;

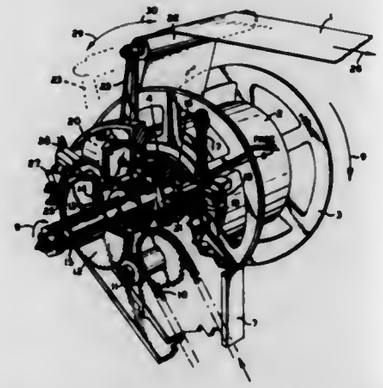
said body portion having a recess adapted to cooperate with said spindle key; and

releasable retaining means formed integrally in the end of said body portion opposite said retainer member whereby said adapter may be inserted into said reel spindle opening and fixed against axial and rotative movement relative to said reel hub and reel spindle.

3,275,258
TAPE REELING APPARATUS
Guillermo Perez, Bristol, Conn., assignor, by mesne assignments, to Royal Typewriter Company, Inc., New York, N.Y., a corporation of Delaware
Filed Apr. 24, 1963, Ser. No. 275,422
4 Claims. (Cl. 242—75.5)

1. Tape reeling apparatus comprising a cylindrical housing,

forward and reverse motor means mounted within said housing,

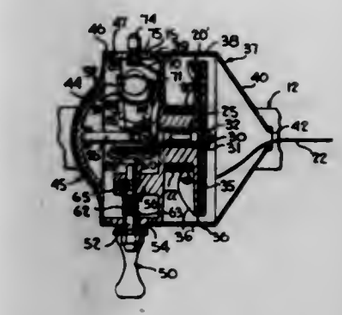


a reel drive shaft axially mounted in said housing and adapted to be driven by said motor means,

a control arm pivotally mounted in said housing having a tape guide bar extending into the path of travel of tape between a mounted tape reel and a tape processing station,

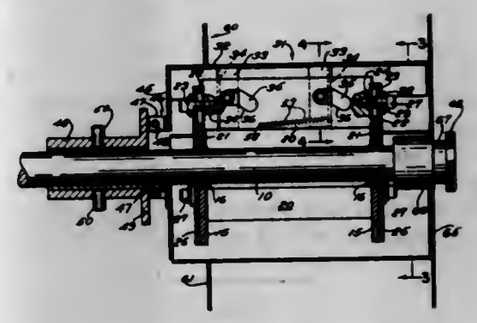
spring means rotatably biasing said control arm in a direction such that a tape loop is produced between said reel and processing unit,

and first and second microswitches associated respectively with said forward and reverse motor means mounted within said housing and operative from a normal to an active state upon movement of said control arm to predetermined arcuate limits, said microswitches being adapted in said active state to energize an associated one of said motor means, said energized motor means effecting according to which microswitch is operative the winding or unwinding of tape from said reel whereby said control arm is moved by said tape or by said spring means to a position between said arcuate limits of motion, said microswitches being operative from active to normal state upon movement of said control arm through a predetermined angle from said arcuate limits.



3,275,259
SUPPLY ROLL BRAKE
Goffredo Gamberini, 9/3° Via Mazzini, Bologna, Italy
Filed Apr. 15, 1964, Ser. No. 359,909
Claims priority, application Italy, May 6, 1963, 162/169
5 Claims. (Cl. 242—75.44)

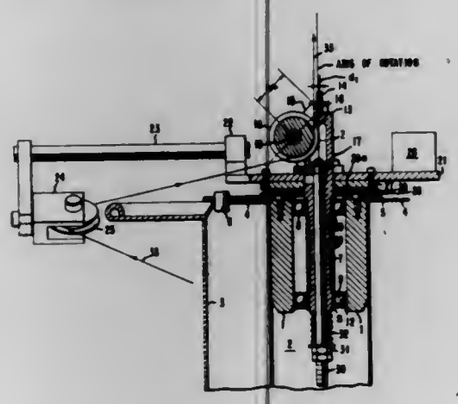
1. Apparatus for supporting and rotating a spool of strip material during the drawing of said material from said spool comprising, a rotatable shaft, drive means for continually rotating said shaft in the direction said strip is unwound, rotatable clutch means frictionally engaging said shaft, said clutch means being directly rotatable with said shaft when said shaft is driven at a predetermined speed and being independently rotatable relative to said shaft when said clutch means is rotated at a speed greater than the speed of said shaft, said spool being mounted on said clutch means to rotate directly therewith whereby the drawing of said strip material is accomplished under traction between said clutch and shaft.



3,275,260
INDICATING MECHANISM FOR FISHING ROD REELS
Otis S. Woollen, Wapella, Ill.
Filed Nov. 14, 1963, Ser. No. 323,676
3 Claims. (Cl. 242—84.2)

1. Indicating mechanism for fishing rod reels comprising body means formed of electrically conductive material, said body means including line spool means for receiving a fishing line, a shaft rotatably supported by said body means, pick-up means operatively connected with said shaft and disposed adjacent said line spool means and adapted to engage a fishing line for retrieving a line after it has been paid out, operating means movably supported by said body means and means for operatively connecting said operating means with said shaft for producing rotation of the shaft and pick-up means, indicating means including an electrically illuminable means supported by an electrically connected with said body means, support means connected with said body means and disposed adjacent said line spool means, a source of electrical energy supported by said support means and having a pair of terminals, one of said terminals being directly connected with said electrically illuminable means, a contact arm operatively connected with the other of said terminals, said contact arm including an extending portion disposed adjacent a part of said shaft and normally

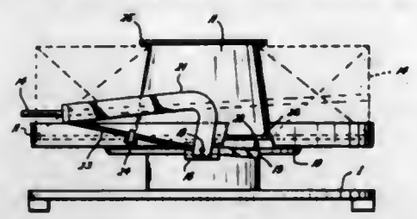
spaced therefrom, said shaft being provided with an outwardly extending portion for directly engaging an intermediate part of said extending portion of the contact arm at certain relative positions of said shaft with respect to said body means and being out of engagement with said extending portion of the contact arm at other relative positions of said shaft with respect to said body means, said shaft and said outwardly extending portion as well as said contact arm all being formed of electrically conductive material, said shaft being electrically connected with said body means and said electrically illuminable means, whereby said illuminable means is intermittently energized and illuminated upon rotation of said shaft with respect to the body means as caused by rotation of said pick-up means as the fishing line is paid out from said line spool means.



3,275,261
COLLAPSIBLE REEL
Harris F. Hanscom, Barrington, R.I., assignor to H. F. Hanscom & Company, Inc., a corporation of Rhode Island
Filed Mar. 23, 1964, Ser. No. 353,930
10 Claims. (Cl. 242—110.2)

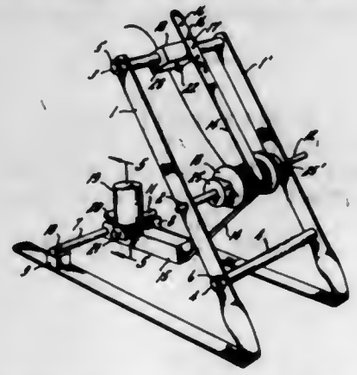
9. A reel comprising a body rotatable about a longitudinal axis, a plurality of drum sectors for contacting the material to be reeled, means for mounting said sectors on the body for radial contraction to release the material reeled therein, a head comprising a plurality of sections

with one section mounted on each of a plurality of drum sectors to move with said sector to contracted position and means for axially adjusting each head section along a drum sector comprising a slot in one part and means passing through the other part and slot to clamp the head section in position.



3,275,262
UNWINDING APPARATUS
Olonzo D. Merrill, Jr., Wayne, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Feb. 28, 1964, Ser. No. 348,212
5 Claims. (Cl. 242—128)

1. A dead spool pay-off apparatus for unwinding wire at high speeds and closely controlled tension levels which comprises:
(a) stationary support means for mating with the vertical bore of said spool,
(b) a rotatable hollow shaft supported by, and extending axially through, said support means and terminating thereabove in a shaft extension,
(c) a platform mounted for rotation with, and reciprocation on, said shaft extension, a rod extending axially through said shaft and having one of its ends attached to said platform, and a spring mounted on the other end of said rod and biasing it and said platform in a downward direction,
(d) a cantilever arm extending laterally from said platform, a swivelled yoke mounted on the outer extremity of the cantilever arm, and a grooved pulley rotatably mounted in said yoke,
(e) a lever positioned above said platform, means fastened to said platform for mounting said lever intermediate its ends, a fulcrum pin mounted at one end of said lever, and a second grooved pulley attached to the other end of the lever, said lever being pivotally journaled, for vertical movement, in said mounting means and adjacent the fulcrum pin, said pin having its tip resting on the top surface of said shaft extension, and said second pulley being operatively aligned with said first pulley and rotatable in a vertical plane, and
(f) braking means operatively associated with said platform and said support means, and responsive to the reciprocation of said platform.



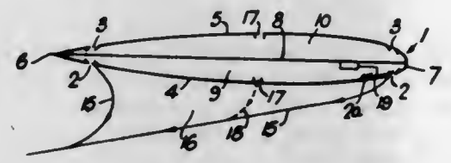
3,275,263
WIRE DISPENSING REEL
Lee D. Parkinson, 819 Fisher, Houston, Tex.
Filed July 27, 1964, Ser. No. 385,274
4 Claims. (Cl. 242—129)

1. In a wire dispensing reel assembly, a plurality of spindles comprising leg members, each of said spindles having guide means on the top and bottoms thereof to receive the legs of superimposed spindles, independently rotatable turntables adapted to be mounted on said

spindles, said spindles having lower rims for receiving rotatable turntables and stop means for receiving a superimposed spindle.

3,275,264
WIRE UNREELING AND TENSIONING DEVICE
Leonard R. Crow, 530 S. 4th St., Vincennes, Ind.
Filed Sept. 24, 1964, Ser. No. 398,927
9 Claims. (Cl. 242—129.8)

1. A wire unreeling device in the form of a coil holding and tensioning mechanism comprising two end brackets with feet; spacers therebetween the two end brackets and means of securing said spacers to said end brackets; a removable coil holding bar with means provided in said bar to hold it in engagement with said two end brackets; an adjustable spool tensioning device and an adjustable wire tensioning device.

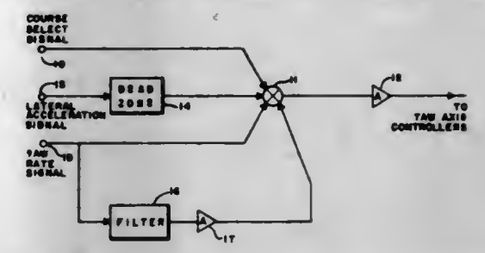


3,275,265
BOUNDARY LAYER CONTROL FLAPS AND APPARATUS THEREOF
Alberto Alvarez-Calderon, 1560 Castilleja St., Palo Alto, Calif.
Filed July 27, 1962, Ser. No. 212,975
5 Claims. (Cl. 244—42)

1. An aircraft wing having an upper surface, a lower surface, a middle portion and a generally spanwise edge inclined at a substantial angle to the normal direction of motion of said wing through the air; and a spanwise door mounted on said wing adjacent to said spanwise edge and having a first door edge generally parallel to said spanwise edge and pivotally connected to said wing at a pivotal axis adjacent to said spanwise edge, a door second edge generally parallel to said door first edge and supporting a boundary layer control tube, and a door surface between said door edges; said door being mounted for rotational movement about said pivotal axis and with respect to said wing from a retracted door position in which said door has its surface adapted to generally conform to the lower contour of said wing adjacent said spanwise edge and is smoothly faired to said lower surface of said wing, with said tube being located substantially between the elevation

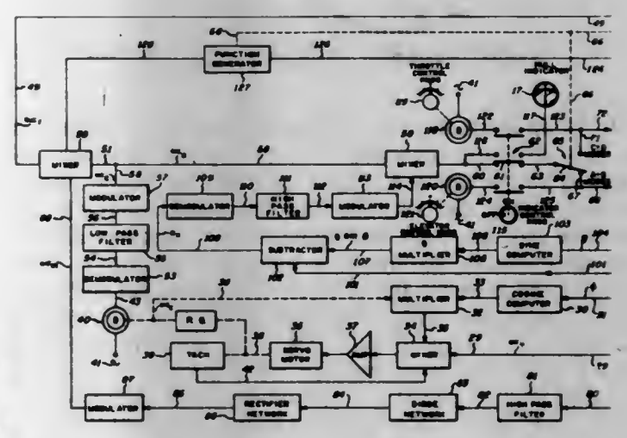
of upper and lower wing surfaces and between said spanwise edge and middle portion of said wing, to an extended door position in which said door surface and tube are on the side of said spanwise edge of said wing opposite from said middle portion of said wing and said boundary layer control tube is remote from said upper and lower surfaces of said wing defining a thickened and generally spanwise edge portion for said wing.

3,275,266
FOILS FOR MOVEMENT IN A FLUID
Christopher Sydney Cockerell, Bassett, Southampton, England, assignor to Hovercraft Development Limited, London, England, a British company
Filed Mar. 6, 1964, Ser. No. 349,834
Claims priority, application Great Britain, Oct. 20, 1959, 35,593/59
3 Claims. (Cl. 244—42)



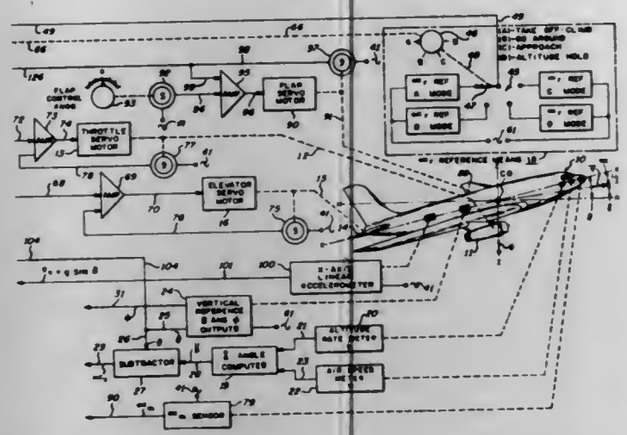
1. An aircraft control member having two oppositely disposed surfaces and a substantially continuous port formed in each surface, each of said ports including two portions extending normal to the direction of motion of the control member through the air, means for selectively supplying gas to the ports in said surfaces and causing said gas to issue from the ports in the form of gaseous curtains which, with the said surfaces, bound at least one space in contact with each of said surfaces, said ports being so constructed and arranged that said gaseous curtains are discharged therefrom at substantial angles to said surfaces and inwardly with respect to said spaces, and means for forming and maintaining a cushion of pressurised gas in each of said spaces during operation of the aircraft, said cushions producing aerodynamic forces on the member upon movement thereof through the air.

3,275,267
APPARATUS FOR CONTROLLING AIRCRAFT
James Martin, Southlands Manor, Southlands Road, Denham, near Uxbridge, Middlesex, England
Filed Nov. 30, 1964, Ser. No. 414,532
Claims priority, application Great Britain, Dec. 12, 1963, 49,196/63
3 Claims. (Cl. 244—75)



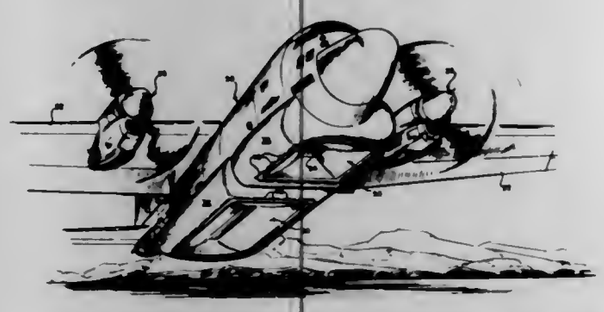
1. In a winged aircraft, in combination:
(a) a fuselage;
(b) a rocket motor;
(c) securing means securing said motor to said fuselage in a position spaced from the center of gravity of said aircraft in which the thrust line of said motor is substantially perpendicular to the longitudinal axis of said aircraft; and
(d) control means in said fuselage and operatively connected to said securing means for releasing said motor from said fuselage in a direction of said line of thrust.

3,275,268
AUTOMATIC CONTROL FOR AIRCRAFT
Samuel H. Auld, Jr., Woodland Hills, Calif., assignor to Lear Siegler, Inc., Santa Monica, Calif., a corporation of Delaware
Filed Oct. 30, 1961, Ser. No. 148,630
7 Claims. (Cl. 244—77)



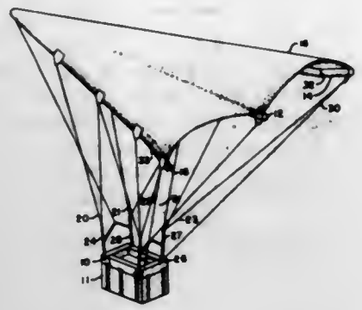
1. A control system for automatically controlling an aircraft about its yaw axis comprising:
automatic course select means to automatically emit a first electrical signal proportional to the error between a selected course heading and the actual heading of said aircraft,
means to emit a second electrical signal proportional to the rate of turn of said aircraft about the yaw axis,
a signal adding means,
first means connecting said signal adding means to said automatic course select signal emitting means for directly applying said course select error signal to said adding means,
second means connecting said rate of turn signal emitting means to said adding means for directly applying said rate of turn signal to said adding means,
filter means responsive to said second electrical signal to provide a third electrical signal which is an electrical integral of said second electrical signal,
third means connecting said filter means directly to said adding means for application of said third electrical signal to said adding means, and
yaw axis control means for the aircraft connected to said signal adding means and responsive to the combined signal thereat for controlling movements of the aircraft about said yaw axis.

3,275,269
DUAL PERIOD AIRCRAFT CONTROL SYSTEM
Peter G. Yiotis, Astoria, N.Y., assignor to Sperry Rand Corporation, Great Neck, N.Y., a corporation of Delaware
Filed Oct. 23, 1963, Ser. No. 318,336
17 Claims. (Cl. 244—77)



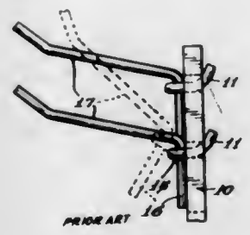
1. In a dual period control system for aircraft, means for monitoring the flight path and forward speed of the aircraft, an inertial computer providing an angle of attack output depending on the tilt attitude and forward speed of

the aircraft, means providing a reference angle of attack output for a particular aircraft condition of flight, a long period stabilizing loop including the aircraft, the monitoring means, the computer and the reference means in which the monitoring means is responsive to the difference between the outputs of the computer and reference means, means providing an output depending on the



acceleration of the aircraft along its longitudinal axis, means for correcting the output of acceleration output means for the effect of gravity on the aircraft, and a short period stabilizing loop including the aircraft, the monitoring means, the acceleration output means and the correcting means in which the monitoring means is responsive to the corrected output of the acceleration output means.

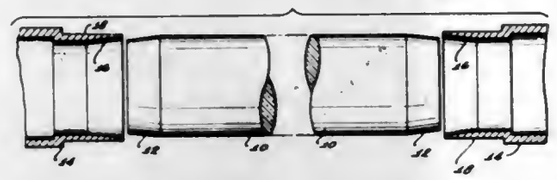
3,275,270
AIRCRAFT WITH GROUND EFFECT TYPE LANDING GEAR
Thomas Desmond Earl, Niagara-on-the-Lake, Ontario, Canada, and Wilfred James Eggington, Clarence, N.Y., assignors to Bell Aerospace Corporation, Wheatfield, N.Y.
Filed Mar. 17, 1965, Ser. No. 440,437
16 Claims. (Cl. 244—110)



1. In an airplane, an undercarriage comprising an elastic cell structure attached to the airplane fuselage and adapted to be inflated into a balloon-like shape, means carried within the airplane for delivering relatively low pressure gas into said cell and thereby inflating said cell into an extended balloon-like form circumscribing a gas cushion space under the airplane fuselage, said cell being formed with gas outlet openings aligned peripherally of the bottom contour of said cell when inflated, elastically closed valve means associated with the outlet openings of said cell and means for delivering relatively high pressure gas to said valve means for actuating the latter to open condition whereby to permit gas to blast through said outlet openings and to feed said gas cushion space with pressured gas for generation of airplane supporting ground effect forces whenever the airplane is disposed in close proximity to a reaction surface.

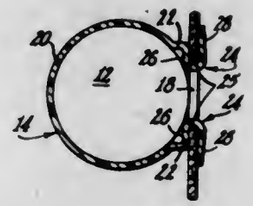
3,275,271
FLEXIBLE WING AIRCRAFT
Joseph E. Forehand, Newport News, Va., assignor to the United States of America as represented by the Secretary of the Army
Filed Nov. 27, 1964, Ser. No. 414,484
1 Claim. (Cl. 244—138)

In an inflatable flexible wing glider a wing comprising a central keel and a pair of lateral spars all of inflatable tubular construction, and a flexible membrane secured to said keel and said spars, a load carrier, shroud lines suspending said load carrier from said keel and said spars, and control lines extending from said load carrier to corresponding ends of said spars for controlling the flight path of the glider by bending said spars, a diameter reducing wrapping around each of said spars to localize deformation of the spars when subjected to bending forces by said control lines and thereby provide uniform bending of the spars for each increment of length said control lines are taken in or let out.



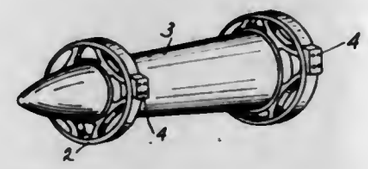
3,275,272
SWIVEL HOOK FOR APERTURED BOARD
Charles R. Kirk, 425 W. Harrison St., Wheaton, Ill.
Filed Oct. 11, 1965, Ser. No. 494,365
3 Claims. (Cl. 248—225)

1. A hook member for detachable engagement with a board formed with regularly spaced apertures, comprising a hanger arm component adapted to extend normally from the face of said board and a substantially U-shaped bracket member adapted to be anchored to said board through a pair of its apertures and means pivotally connecting said arm and said bracket whereby said bracket can be engaged to and disengaged from said board in an arcuate directional manner while maintaining said hanger arm disposed substantially normal to the plane of said board.



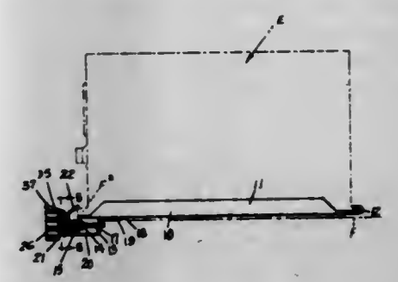
3,275,273
SUPPORT STRUCTURE FOR LASER RODS
Jon H. Myer, Newport Beach, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed Nov. 1, 1965, Ser. No. 505,848
6 Claims. (Cl. 248—264)

1. In combination:
a laser rod having a tapered end;
a tubular support element of spring material, said support element having an end portion encircling the tapered end of the rod and having an interior tapered



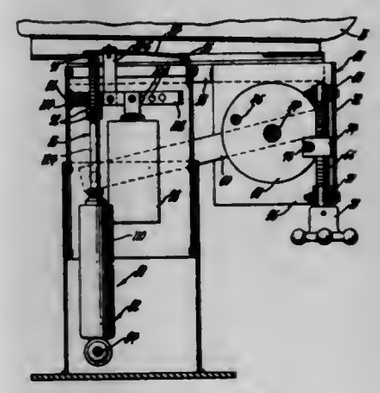
surface in face to face contact with the lateral surface of said tapered end and forming a fluid-tight seal thereon.

3,275,274
MERCHANDISE DISPLAY CARD AND CLIP THEREFOR
Charles F. Hutcheon, 192 Shepherd Lane, Roslyn Heights, N.Y.
Filed Oct. 5, 1965, Ser. No. 493,200
14 Claims. (Cl. 248—309)



1. An improved resilient clip for holding an article on a slotted support member, said clip comprising:
(A) an article-holding member including a body portion sized and shaped to closely envelop at least a portion of an article, said body portion having first and second ends and a longitudinal axis;
(B) a gripping portion integral with each of said body portion ends; and
(C) at least one expandable gusset integral with said body portion intermediate the ends thereof and extending substantially parallel to the longitudinal axis of said body portion.

3,275,275
MOUNTING WITH ELASTOMERIC STRUTS
Robert C. Erhart, Erie, Pa., and Jack M. Weaver, Dayton, Ohio, assignors to Lord Corporation, a corporation of Pennsylvania
Filed Mar. 21, 1963, Ser. No. 266,898
1 Claim. (Cl. 248—358)



A mounting comprising inner and outer rings with the outer surface of the inner ring presented toward and radially spaced from the inner surface of the outer ring, the inner ring being adapted to be connected to a supported member and the outer ring being adapted to be connected to a support, and a plurality of elastomeric struts between the inner and outer rings, each strut having its inner end bonded to the outer surface of an inner ring and its outer end bonded to the inner surface of the outer ring with which it is associated, said struts forming in elevational view a polygon with the corners of the polygon joined to the outer ring and with the sides of the polygon joined to the inner ring midway between the corners, said struts being columns of length to thickness ratio such that the columns buckle under radial compression loads exceeding a predetermined threshold.

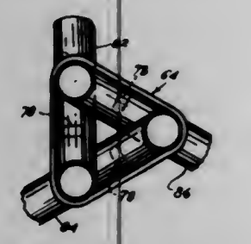
3,275,276
SELF-LOCKING CLAMP
Kenneth W. Johnson, Jamestown, Ohio, assignor, by mesne assignments, to Barry Wright Corporation, Watertown, Mass., a corporation of Massachusetts
Filed Mar. 3, 1965, Ser. No. 436,770
8 Claims. (Cl. 248—361)

1. A self-locking clamp comprising a fixed jaw member and a movable jaw member, a threaded member extending through said movable jaw and secured against linear movement relative thereto and threadedly engaging through means carried by said fixed jaw whereby rotative movement of said screw moves said movable jaw relative to said fixed jaw, a knob on the end of said screw which extends through said movable jaw, a toothed disc fixed to said movable jaw between said movable jaw and said knob and surrounding said screw, and a finger pivoted on said knob selectively movable into and out of engagement with the teeth of said disc to preclude rotation of said knob and said screw when engaged with said teeth.

3,275,277
VEHICLE SEAT
William A. Illar, Cleveland, and Alvin A. Rood, Willoughby, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 8, 1964, Ser. No. 402,497
4 Claims. (Cl. 248—399)

1. In combination with a vehicle floor, a seat, a base cylinder member fixed at one end to said vehicle floor, an upper cylinder member having one end thereof telescoping into said base cylinder member and the other end secured to said seat, a suspension assembly resiliently supporting said seat on said base cylinder member for oscillating movement relative to the latter, said suspension assembly comprising a spring interconnected between said cylinder members, a shock absorbing device interconnected between said cylinder members for damping said

oscillating movement, said shock absorbing device having means for modulating the damping effect thereof, said last-mentioned means including a moveable member which when depressed increases the damping effect of said shock absorbing device and when released decreases said damping effect during the compression and expansion stroke, an actuator pivotally supported on the upper cylinder member and operatively associated with said movable member for normally maintaining the latter in a depressed state, a mass pivotally connected to the upper cylinder member and operatively associated with said actuator, said mass being responsive to acceleration forces to provide relative vertical movement between said mass and said upper cylinder member so as to control the position of the actuator and the damping effect of the shock absorbing device during oscillating movement of the seat.



3,275,278

PATIO TRAY LEG RETAINER

Raymond S. Haydock, Morton Grove, Ill., assignor of one-half to Raymond Haydock, Jr., and one-half to Sandra L. Haydock, both of Chicago, Ill.

Original application Oct. 13, 1964, Ser. No. 403,467. Divided and this application Oct. 1, 1965, Ser. No. 491,968

1 Claim. (Cl. 248—431)

A plastic leg retainer, of resilient deformable material, said retainer being substantially triangular in plan, with rounded corners, inside and outside, said retainer being relatively thin in vertical cross section, and relatively wide, vertically, and each of its three sides, having on the inside, an inwardly projecting integral plastic pin, located midway between the top and bottom of each side, and midway between the ends of each side, each pin being surrounded at its juncture with the side, by a tapered portion, said leg retainer being for patio tray assemblies of the type having a tray top with sockets for receiving the upper ends of the legs, which cross each other midway between the floor and the tray top, in which the legs are secured together by a leg retainer of plastic of the shape and characteristics described above, each of the integral pins engaging in a hole in each leg, the band confining the legs, and supporting the tray top firmly when the legs are spread, and the legs being removable as a unit, and movable into parallel position for storage or shipment, and the plastic leg retainer being deformable to insert the pins in the holes in the legs, after which the leg retainer springs back into triangular form.

3,275,279

TELEPHONE DIRECTORY COVER AND HOLDER

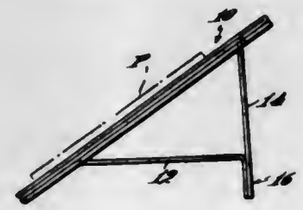
William N. Caldwell, Hazlet, N.J., James W. Ericsson, Indianapolis, Ind., and Robert E. Prescott, Rumson, and William E. Whidden, Red Bank, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Mar. 24, 1965, Ser. No. 442,257

15 Claims. (Cl. 248—447)

1. In a telephone directory cover composed of a relatively flexible material and including a binding edge, two sides and opposed flanges for protectively enclosing exposed edges of a directory, the improvement comprising, a pair of continuous, flexible magnetic strips attached along the respective meeting edges of said opposed flanges

whereby on closure of said sides, said strips abut one another in a continuous, weatherproof seal regardless of minor misalignments of said opposed flanges.



3,275,280

EASEL-TYPE MOUNT

Gordon E. Nichols, Middleboro, Mass., assignor to Winthrop-Atkins Co., Inc., Middleboro, Mass., a corporation of Massachusetts

Filed Oct. 20, 1964, Ser. No. 405,148

12 Claims. (Cl. 248—459)

1. A structure comprising at least two plies of stiff board joined face-to-face to provide a rigid panel, a first part extending rearwardly from one of the two plies, a second part extending rearwardly from the other of the two plies through an opening in said one ply, said parts intersecting rearwardly of the panel, a third part hinged to the distal end of the first part, and means securing the third part in parallel relation to a portion of corresponding area at the distal end of the second part, said third part forming with the portion of the second part, to which it is secured, a foot, located rearwardly of the intersection of the first and second parts, for supporting the panel, the proximal end of said second part being unconnected to the panel, and said foot providing means for rotating said second part from an operative position with its proximal end abutting the rear side of the panel, to an inoperative position situated entirely within said opening in said other ply forwardly of the one ply.

3,275,281

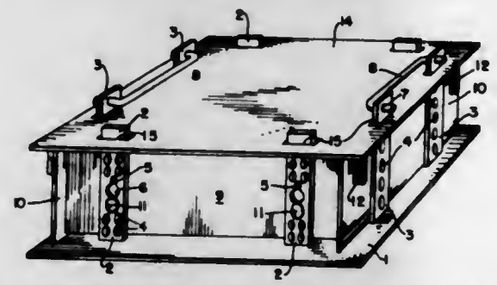
EASEL STRUCTURE

George H. Sampson, Middleboro, Mass., assignor to Winthrop-Atkins Co., Inc., Middleboro, Mass., a corporation of Massachusetts

Filed Jan. 12, 1965, Ser. No. 424,941

17 Claims. (Cl. 248—465)

1. A structure comprising a panel, a leg connected to the panel for movement to an angular position relative thereto, a foot hinged to the distal end of the leg, a brace integral with the foot, said brace having a distal end rotatable inwardly from the leg against the panel, by rotation of the foot about the axis of the hinge connecting the foot to the leg, to effect angular separation of the leg and panel, and means on the panel and at the distal end of the brace interengageable to hold the leg and panel angularly displaced from each other.



3,275,282

MULTIPARTITE MOLD FOR EXPANSIBLE MATERIAL

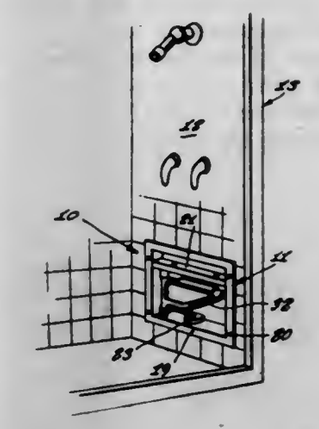
Ernst Otto Schulz, Neuhaus am Rennweg, Thuringia, Germany, assignor to Vereinigung Volkseigener Betriebe Glas Dresden, Dresden, Germany

Filed Sept. 25, 1963, Ser. No. 312,829

9 Claims. (Cl. 249—82)

1. A multipartite mold for producing a molded article from expansible material, comprising an assembly of a plurality of substantially flat side wall members, a base member and a cover member movably connected to each other and defining an enclosed mold cavity, said base member having lug means secured thereto external to said mold cavity for guiding and supporting said movably connected side wall members, adjacent ones of said side wall members, said base and said cover members being movable relative to each other from positions respectively in which said mold cavity has a minimal volume to positions respectively in which said mold cavity has a maximal volume, said mold cavity having its minimal volume in an upright position of said assembly and being chargeable with expansible material in said upright position, said side wall members being automatically movable by the expansion of said material to respective positions in which said mold cavity has a maximal volume, said cover member being removable from said assembly and said assembly being invertible from said upright position, said cover member having formed therein apertures into which said lug means extend, said apertures being of the size permitting free movement of said lug means therein, whereby a molded article may be released from said mold cavity when said cover member is removed and said assembly is inverted without disconnecting said base member and said side wall members.

3,275,283



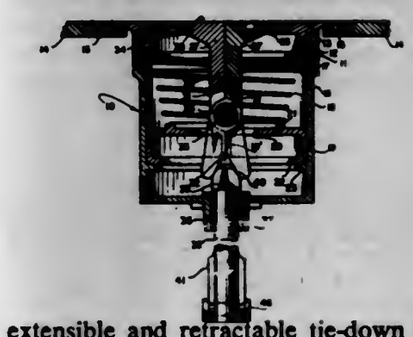
FOLDING FOOT REST

Lauren F. Rauch, Box 33, Jenera, Ohio

Filed Oct. 18, 1965, Ser. No. 496,865

4 Claims. (Cl. 248—205)

1. In a folding foot rest and seat the combination of a housing unit, a foot rest unit and a seat unit supported on said housing unit, said set unit being removable from said housing unit and said foot rest unit being pivotable between a storage position within said housing and a utility position outside of said housing.



3,275,284

EXTENSIBLE AND RETRACTABLE TIE-DOWN FITTING

Thomas H. Gary, Atlanta, Ga., assignor to Lockheed Aircraft Corporation, Burbank, Calif.

Filed Feb. 19, 1965, Ser. No. 433,946

14 Claims. (Cl. 248—361)

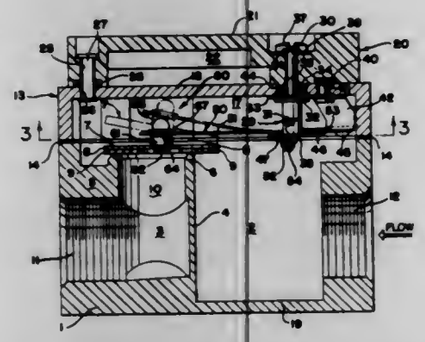
1. An extensible and retractable tie-down fitting comprising a connecting element mounted within an opening provided therefor in stationary structure with its outer face conforming in shape and area to said opening and normally disposed substantially in the plane of the exterior surface of said structure, resilient means operative on said element in distinct lineal and lateral directions to maintain said face in the normal position aforesaid, and overpowering means sequentially operative on said resilient means in opposition to said lineal and lateral directions.

ERRATUM

For Class 249—82 see:
Patent No. 3,275,282

3,275,285

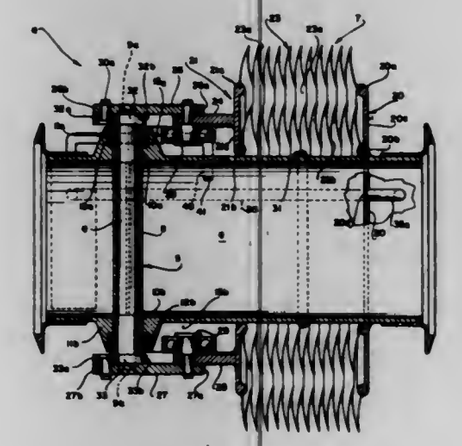
THERMOELECTRIC VALVE



Rexford M. Morris, Mansfield, Ohio, assignor to Therm-O-Disc, Incorporated, Mansfield, Ohio, a corporation of Ohio

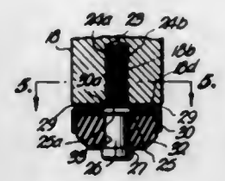
Filed Sept. 23, 1963, Ser. No. 310,704

7 Claims. (Cl. 251—11)



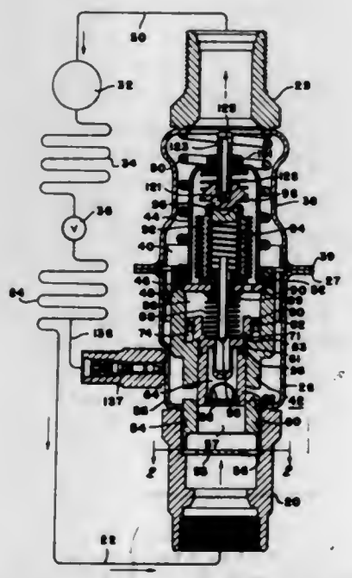
1. A thermoelectric gas valve assembly comprising a valve casing having inlet and outlet passages and valve means between said passages, said valve means comprising a valve seat having a narrow marginal surface located substantially in a horizontal plane and a valve member for resting on said marginal surface, said valve member being constrained on said seat under pressure of gas in the valve casing, a generally horizontal cantilever mounted arm

comprising two bimetallic members of substantially different lengths rigidly connected together at their adjacent ends, the shorter member being spaced horizontally from said valve seat, the outer end portion of said shorter member being rigidly mounted on said valve casing and the outer end portion of the longer member being located above said valve member, electrical heating means mounted on said shorter member and insulated from said longer member for heating the shorter bimetallic member and



causing it to open the valve when an electric current is supplied thereto, the longer member bending in a direction opposite that of the shorter member in response to an increase in ambient temperature and an articulate connection between said end portion of the longer member and said valve member for causing the valve member to pivot about one side of the valve seat and having its center offset from the central axis of said seat.

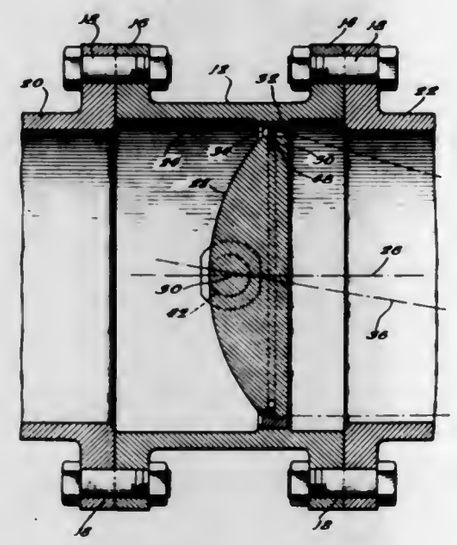
3,275,286
FLOW CONTROL VALVE
James H. Wood, Marietta, Ga., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Oct. 8, 1962, Ser. No. 228,917
10 Claims. (Cl. 251—30)



1. In combination: a duct; a valve element mounted in said duct for closing said duct; an annular bellows mounted in surrounding guided relation on said duct and having one end fixed with respect to said duct and the other end movable with respect thereto; actuating linkage directly connecting the movable end of said bellows to said valve element; and a fluid line means with control means therein connecting the interior of said bellows with the interior of said duct immediately upstream of said valve element and to exhaust for expanding and contracting said bellows to actuate said valve element between open and closed positions.

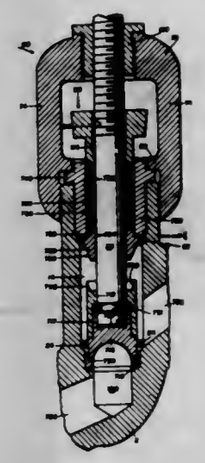
3,275,287
COMPONENTS FOR FAUCET VALVE WASHER REPLACEMENT
Joseph E. Bartlett, 215 S. Parker Ave., Highway 7, Olathe, Kans.
Filed Apr. 11, 1963, Ser. No. 272,345
2 Claims. (Cl. 251—88)

1. The combination with a valve stem having an end face provided centrally with a threaded axial recess, of a pin element having a shank portion for threaded insertion in said recess, said shank portion having a slot therein and providing parallel legs, said legs having oppositely deflected central zones deflected in direction substantially parallel to the plane of said slot, said centrol zones having circumferentially directed thread ridges adapted to engage with the threads in said recess, the largest dimension across said central zones being greater than the diameter of said recess and said shank constructed of resilient material, said pin element further provided with a head portion formed as a cylindrical surface and having axially spaced circumferential flanges of greater diameter than said surface at each end, a smooth gasket sleeved over said shank portion of said pin and positioned adjacent said face, and an annular washer sleeved over said head portion and supported on said surface and between said flanges for rotation with respect to said surface.



3,275,288
REFRIGERATING APPARATUS
John Weibel, Jr., Dayton, and Thomas C. Shuler, Jr., Trotwood, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 1, 1964, Ser. No. 393,630
1 Claim. (Cl. 251—127)

A flow control device for a combined gas and liquid fluid including a body having an inlet and an outlet, a movable piston valve member of a selected circular area substantially coaxially aligned with said inlet, said body

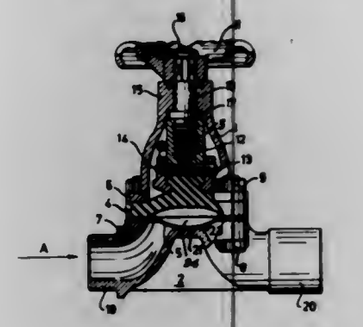


being provided with a stationary valve seat member cooperating with said movable piston valve member to control the flow of fluid through said inlet, a baffle located transversely relative to said inlet between said inlet and said movable valve member and having a central substantially imperforate flat circular disc portion of an area substantially the same as and concentric with the selected area of said piston valve member substantially coaxially aligned with said piston valve member for minimizing the effect of the momentum of the fluid upon the movable valve member, said baffle being provided with a plurality of outwardly extending narrow support arms supported by said body, said body having a shoulder abutting and supporting one side of said arms of said baffle, said seat member for said piston valve member abutting the opposite side of said arms for holding in place said baffle, said narrow support arms holding said central flat circular disc portion spaced a substantially uniform distance away from adjacent portions of said valve body substantially throughout the periphery of said flat circular disc portion sufficient to provide large enough openings between said support arms to prevent restriction of the area of flow as compared to the area of flow between the valve member and said seat member.

3,275,289
BUTTERFLY VALVE WITH FRUSTO-CONICAL METAL SEAT
Donald G. Fawkes, Chicago, Ill., assignor to Henry Pratt Company, a corporation of Illinois
Filed July 12, 1963, Ser. No. 294,569
8 Claims. (Cl. 251—306)

1. A butterfly valve, comprising: a valve housing having a fluid passage therethrough about a longitudinal center line; a closure disc rotatable in the housing about an axis normal to the center line between open and closed positions; and a valve seat in the housing having an inwardly facing annular surface for cooperatively contacting the periphery of the disc to close the valve when the disc is in closed position, said valve seat surface being spaced longitudinally of the center line from said disc axis and being generally centered about said center line, said seat surface having the shape of a part of a conical surface extending longitudinally of the center line away from the disc axis, the apex of the cone being located laterally of the center line so that the seat surface is asymmetrical about the center line and the closure disc may be wedged into the valve seat surface upon closing motion.

3,275,290
BACK SEAT CONSTRUCTION FOR VALVE
Chester A. Siver, 10 Fair Hill Lane, Suffield, Conn.
Original application Dec. 2, 1962, Ser. No. 244,092, now Patent No. 3,219,311, dated Nov. 23, 1965. Divided and this application Jan. 19, 1965, Ser. No. 426,493
9 Claims. (Cl. 251—330)

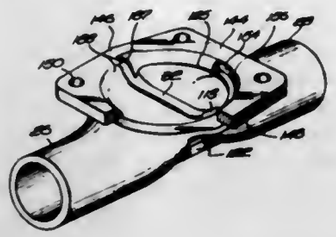


1. In a valve including a valve body having a valve chamber communicating with a through flow passage and an annular valve seat on the wall of said valve body in said flow passage; a bonnet covering the outer end of said valve chamber; and a valve stem reciprocable in said valve chamber relative to said bonnet and valve seat, the combination therewith of a valve sealing assembly for said valve including an annular back seat portion on said bonnet concentrically disposed about said valve stem and projecting toward said through flow passage and a metallic valve sealing member mounted on said valve stem for reciprocation therewith, said back seat portion being metallic and having a generally conical seating surface portion extending circumferentially about the outer surface thereof and tapering to a reduced diameter at the inner end thereof, said valve sealing member having a first seating surface portion at the end thereof adjacent said through flow passage dimensioned and configured to cooperate with said valve seat and provide a fluid-tight seal in cooperation therewith and an annular back seat sealing lip portion concentrically disposed about said valve stem and extending toward said bonnet, the inner periphery of said back seat sealing lip portion having a generally conical seating surface portion opening toward said bonnet and configured and dimensioned to cooperate with the generally conical seating surface portion of said back seat portion and provide a fluid-tight seal in cooperation therewith, said back seat sealing lip portion seating surface having an angle of taper relative to the axis of reciprocation of said valve stem normally slightly less than the corresponding angle of taper of said back seat portion seating surface portion and selected to provide limited deformation of said sealing lip portion to conform to the taper of said back seat portion seating surface portion within the elastic limits of the metal thereof, said sealing lip portion being transversely deflected by movement against said back seat portion into stressed substantially fluid-tight sealing engagement with said back seat portion seating surface portion, said valve chamber providing free access to the outer periphery of said sealing lip portion in the back seated position of said valve sealing member to enable passage of fluid freely thereabout, said sealing lip portion being transversely deflectable against said back seat portion during operation of the valve by fluid pressure acting against the outer periphery thereof to enhance the sealing engagement of said back seat portion and said sealing lip portion.

3,275,291
DIAPHRAGM CHECK VALVE

Pieter Meijers, The Hague, Netherlands, assignor to Gemeente 's-Gravenhage, The Hague, Netherlands

Filed June 30, 1964, Ser. No. 379,295
Claims priority, application Netherlands, July 8, 1963, 295,056
5 Claims. (Cl. 251—331)



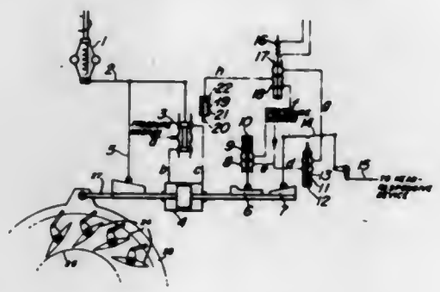
1. A valve comprising a first body portion having an opening in a surface thereof and an internal protuberance defining a seat extending across said opening and facing in the same direction as said surface, said first body portion further having inlet and outlet passages respectively extending to and from said opening at the opposite sides of said seat, an elastic membrane extending over said opening, a flexible diaphragm superimposed on said elastic membrane, a second body portion having a surface mating with said surface of the first body portion, means securing together said first and second body portions with the peripheries of said membrane and diaphragm clamped between the mating surfaces of said body portions, and control means carried by said second body portion and connected with said diaphragm to move the latter toward and away from said seat, said elastic membrane having an aperture therein at the side of said seat from which said outlet passage extends so that, in the event that fluid pressure in said outlet passage exceeds the fluid pressure in the inlet passage when said diaphragm is moved away from said seat, the excess pressure urges fluid to enter between said diaphragm and membrane to urge the latter into sealing engagement with said seat and thereby prevent back-flow through the valve.

3,275,292
DIAPHRAGM VALVE BODY FLANGE CONSTRUCTION

Henry W. Boteler, East Greenwich, R.I., assignor to Grinnell Corporation, Providence, R.I., a corporation of Delaware

Original application July 19, 1962, Ser. No. 210,984. Divided and this application Oct. 23, 1965, Ser. No. 502,938
8 Claims. (Cl. 251—331)

1. A diaphragm valve body comprising:
(A) a container member having:
(1) a passage which:
(a) extends through said container member,
(b) has an axis,
(2) a diaphragm opening which:
(a) is located in one side of said container member,
(b) has an axis substantially intersecting said passage axis at substantially right angles thereto,
(3) a flange which:
(a) surrounds said diaphragm opening,
(b) has a flat surface substantially perpendicular to said opening axis,
(c) has inner and outer edges,
(B) a diaphragm clamping plate having:
(1) a diaphragm opening which:
(a) extends through said plate,
(b) has side walls,

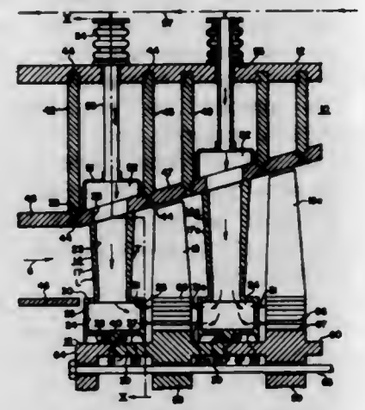


(2) a substantially flat annular surface which:
(a) surrounds said clamping plate opening,
(b) overlies only an outer annular portion of said flange surface,
(C) a weld between the plate opening side walls and the remaining inner annular portion of said flange surface.

3,275,293
CONTROL DEVICE FOR CONTROLLING THE CLOSING OPERATION OF WATER SHUT-OFF MEANS OF A WATER PUMP-TURBINE

Takashi Hosogai and Hideo Ebisawa, both of Hitachi-shi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan

Filed July 6, 1964, Ser. No. 380,495
Claims priority, application Japan, July 9, 1963, 38/35,244
7 Claims. (Cl. 253—24)



1. A control device for controlling the closing operation of water-shut-off means of a water pump-turbine device, comprising:
water shut-off means for said pump-turbine device,
first control means operatively connected with said water shut-off means to control the closing characteristics of said water shut-off means under pump operation of the pump-turbine device,
second control means operatively connected with said water shut-off means for controlling the closing characteristic thereof under turbine operation of said pump-turbine device,
selecting means operatively connected with said first and second control means for selectively rendering effective either said first or said second control means in accordance with the operating condition of the pump-turbine device,
and actuating means operatively connecting said first and second control means with said water shut-off means for actuating said water shut-off means by the one of said first and second control means selected by said selecting means.

3,275,294
ELASTIC FLUID APPARATUS

James M. Allen, Broomall, and Augustine J. Scalzo, Philadelphia, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

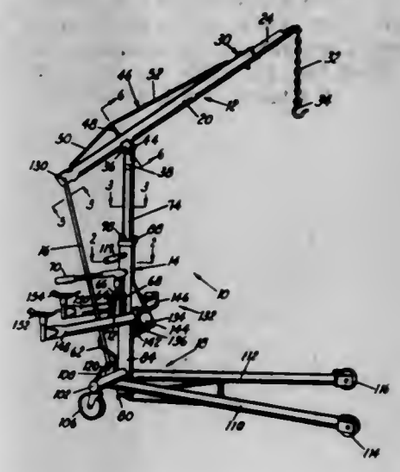
Filed Nov. 14, 1963, Ser. No. 323,737
8 Claims. (Cl. 253—39.1)

1. A bladed diaphragm structure for an axial flow elastic fluid utilizing machine, comprising
an annular row of radially extending blades,
said blades having a vane portion, a radially outermost tip portion and a radially innermost base portion,
an annular shroud struoture cooperatively associated with said tip portions for supporting said blades,
said base portions being similarly shaped and having complementary interlocking portions, and
an annular band in the form of a relatively thin strip rigidly connected to each of said base portions and maintaining said base portions in frictionally interlocking relation with each other, said band being of sufficient flexibility to permit radial expansion and bending of said blades in circumferential direction and to effect vibrational damping of said blades.

3,275,295
TURBINE BLADE WITH TAPERED ONE-PIECE EROSION SHIELD

John Caldwell, Rugby, and Robert Hunter Telfer, Whetstone, England, assignors to The English Electric Company Limited, London, England, a British company

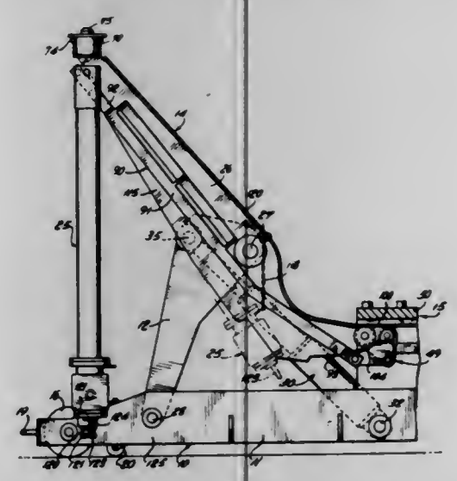
Filed June 11, 1965, Ser. No. 463,271
Claims priority, application Great Britain, June 12, 1964, 24,547/64
2 Claims. (Cl. 253—77)



1. A turbine blade comprising a body portion having a flat face formed along the leading edge thereof and a shield, formed in one piece from a material substantially more resistant to erosion than said body portion, bonded to said flat face and extending the whole length of the body portion wherein said shield is tapered to zero thickness adjacent the blade root, the wider end of the shield being at the blade tip.

3,275,296
HOISTING TRUCK HAVING BOOM MEANS COMPRISING A TENSION FULCRUM BAR

Gerald Raymond Meyer, Centerville, Mich., assignor to himself and Richard I. Ward, Three Rivers, Mich., as joint tenants with right of survivorship



Filed Apr. 12, 1965, Ser. No. 447,223
5 Claims. (Cl. 254—8)

1. A portable hoist which comprises: (1) a generally horizontally disposed boom, comprising a main pipe having a fulcrum end and an open, load carrying end, said main pipe in the region of said fulcrum end being adapted to receive the top end portion of a fulcrum bar and pivotal connection means therefor, said main pipe between said ends having attached thereto a pair of downwardly extending mounting blocks, one on one side of said main pipe, the other on the other side of said main pipe with a round mounting sleeve disposed between said mounting blocks underneath said main pipe with means pivotally connecting said mounting sleeve to said mounting blocks, said main pipe further comprising a brace structure on the top side thereof; (2) a hydraulic jack comprising a vertically disposed hydraulic cylinder having a hydraulic fluid inlet in the region of the bottom end thereof and containing a piston between said inlet and the top end thereof, a vertically disposed lift rod connected to said piston and extending from the top side of said piston through the top end of said hydraulic cylinder to a cylindrical lift head above said cylinder, the axis of said cylindrical lift head being vertically disposed, said mounting sleeve being mounted on said lift head, and a vertically disposed cylindrical skirt attached to and extending downwardly from said lift head and surrounding the upper portion of said hydraulic cylinder, said hydraulic jack further comprising a hydraulic pump with hydraulic fluid release means and a hydraulic fluid outlet, and hydraulic fluid hose means having one end coupled to said outlet and the other end coupled to said hydraulic fluid inlet of said hydraulic cylinder; (3) frame means comprising a base supporting said hydraulic cylinder at its bottom end, upright columns on each side of said hydraulic cylinder with the bottom ends thereof being attached to said base, top plate means attached to the top ends of said upright columns, said top plate means having an opening therethrough for said cylindrical skirt, pairs of forwardly and laterally projecting horizontally disposed arms secured to the opposite outer sides of said upright columns, the other fastened to the other upright column, wheel means rotatably mounted on the outer ends of said arms, a cross bar member attached to the inner ends of said forwardly projecting arms

and disposed on the rear side of said upright columns, said cross bar member comprising bracket means for receiving the bottom end portion of a fulcrum bar; and (4) a fulcrum bar extending from said bracket means to the portion of said main pipe of said boom adapted to receive the top end portion of said fulcrum bar, means pivotally connecting the bottom end portion of said fulcrum bar to said bracket means and means pivotally connecting the top end portion of said fulcrum bar to said main pipe.

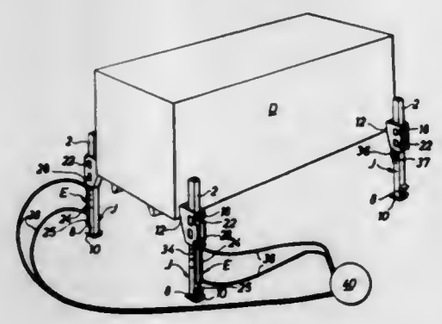
3,275,297
HOISTING TRUCK HAVING PISTON ACTUATED PARALLELOGRAM BARS
Erich Bloch, New York, N.Y., assignor to Aeronautical Machinery Corporation, a corporation of New Jersey
Filed Jan. 11, 1965, Ser. No. 424,682
9 Claims. (Cl. 254—10)

1. A lifting device comprising a single lifting lever arm having spaced interconnected side walls defining therebetween a hollow having an end for supporting and raising a load, means for imparting to said lever arm a movement in a direction to cause said load supporting and raising end to move in a vertical direction, a tube jack extending along said lever arm and nested in said hollow in inoperative lowermost position of said lifting device, and means for moving said tube jack from said inoperative position towards upright position as said end of the lever arm is raised and for lining up said tube jack in upright position underneath said end of the lever arm as said end of the lever arm reaches the upper part of its upward movement, said tube jack being adapted in upright position to pick up the load from said end of the lever arm in the uppermost position of said end of the lever arm and to lift it an additional amount permitted by the range of operation of said tube jack.

3,275,298
DEMOUNTABLE CONTAINERS PROVIDED WITH JACK LEGS FOR RAISING AND LOWERING THE SAME
Albert M. Hand, Etobicoke, Ontario, Canada, assignor, by mesne assignments, to Steadman Industries Limited, Cooksville, Ontario, Canada
Filed June 22, 1964, Ser. No. 376,726
10 Claims. (Cl. 254—45)

1. A jack for raising and lowering a heavy body through a plurality of elevations comprising:

a standard having a foot on which it is erectly disposable adjacent a body to be raised and lowered between upper and lower limits on said standard and to be propped at various levels between said limits;



a support movable on said standard between said upper and lower limits having an extension releasably engageable with an element of said body co-acting with said extension to load the body on said support and render it co-movable therewith on said standard;

a stop releasably fixable on said standard for arresting descent of said support at selected levels, the load on said support being thereby transferred to said stop and through it onto said standard for propping the body on said standard;

an elevator having spaced terminals;

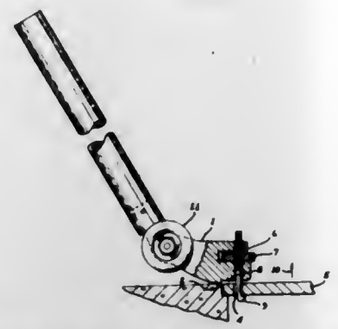
a reaction base stationed on said standard between said foot and said support, and

vertically spaced, aligned connections on said support and reaction base respectively engageable with said elevator terminals accommodating installation of said elevator on said standard between said support and said reaction base;

said elevator being expandable to spread said terminals apart and, when installed as aforesaid, to initially engage said terminals with said connections for positioning said elevator on said standard and thereafter to raise said support from a level at which it is arrested by said stop to a higher level thereby unloading the said stop and transferring the load therefrom to said reaction base and through said reaction base to said standard;

said elevator being thereafter also contractible for drawing said terminals together permitting regulated descent of said support on said standard until rearrested by said stop; the elevator being then further contractible for reloading said support on said stop permitting disengagement of said terminals from said connections and removal of said elevator from said standard;

said stop being releasable from said standard when unloaded as aforesaid and being refixable to the standard at a new level to rearrest said support and prop said load on the standard at said new level.

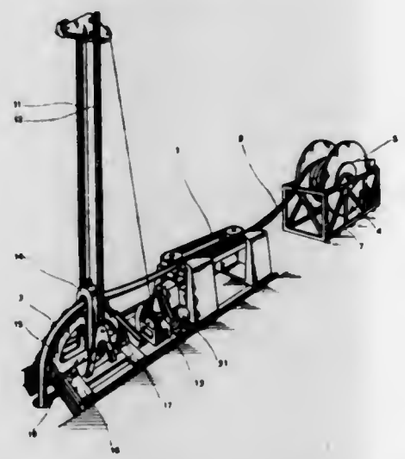


3,275,299
MANHOLE COVER HANDLING DEVICE
Allan D. Meshew, Tempe, Ariz., assignor, by direct and mesne assignments, to Aztec Manufacturing Company, a corporation of Arizona
Filed June 18, 1964, Ser. No. 376,144
8 Claims. (Cl. 254 —131)

1. A device for disengaging a manhole cover from its seated position, lifting the cover and trundling it to another location comprising:

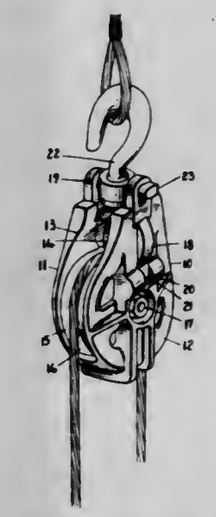
(a) an elongate frame having a front end and a rear end and shaped to provide a ground-contacting fulcrum point therebetween;

(b) a cover latch assembly carried on the front end of the frame comprising a downwardly depending latch stud, having a forwardly facing cover latch on its lower end, said latch stud being adapted to be inserted through a hole in the edge area of the manhole cover and latch under the lower surface thereof;



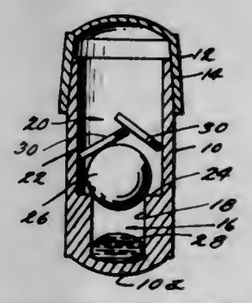
(c) a wheel assembly carried on the rear end of the frame and positioned such that when the cover latch is in the cover disengaging position the wheels are spaced from the ground; and

(d) an operating lever handle secured to said frame in general alignment with the axis of said wheels extending upwardly rearwardly from the frame,



(e) whereby in a continuous movement as the operating lever is lowered, the cover is engaged between said latch and frame, is lfted as the frame is rotated about said fulcrum, and is brought to wheel trundling position with the wheels engaging the ground and the fulcrum raised therefrom.

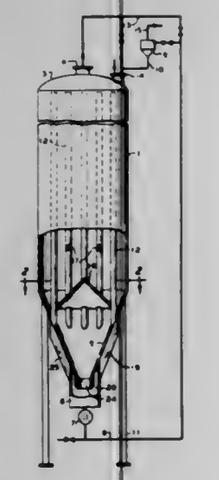
3,275,300
WELL DRILLING APPARATUS
Jacques Delacour, Paris, and Jean Parola, Rueil-Malmaison, France, assignors to Institut Francais du Petrole des Carburants et Lubrifiants, Rueil-Malmaison, Seine & Oise, France
Filed June 1, 1964, Ser. No. 371,722
Claims priority, application France, July 29, 1960, 834,590
8 Claims. (Cl. 254—175.7)



1. A surface apparatus for handling a drill string in drilling bore holes by means of a well boring machine suspended on a flexible tubing, and comprising in combination substantially vertical mast means positioned at substantially the head of a bore hole, an arcuate roller-carrying frame provided with grooved rollers, said frame being slidably mounted between said substantially vertical mast means for movement from an upper position to a lower position, means for so moving said frame, said flexible tubing extending over said frame and grooved rollers and carried thereby, means supporting said frame in said lower position to receive the flexible tubing vertically and tangentially from said bore hole and for delivering it horizontally and tangentially to a horizontal support, means on said support for laterally gripping said tubing on said support and moving it horizontally, said last named means comprising opposed horizontally operating endless chain means having a path therebetween for said tubing, means for driving said endless chain means and reel means to receive the tubing moved horizontally by said chain gripping and moving means.

3,275,301
SHEAVE PULLEY
John A. Read, R.R. 2, North Bay, Ontario, Canada
Filed Oct. 1, 1964, Ser. No. 400,722
2 Claims. (Cl. 254—194)

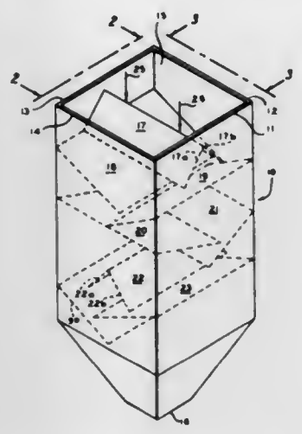
1. A sheave assembly consisting essentially in the combination of, a substantially U-shaped unitary body portion having a pair of spaced parallel side plates interconnected at the lower ends thereof by an integral bight section; a sheave mounted for rotation in said body portion between said side plates, said side plates and said bight section being recessed, at least in part, to receive the rims of the sheave flanges, said side plates extending upwardly from adjacent the axis of rotation of the sheave, each extended portion of each plate being bifurcated; gate means pivotally mounted at one end thereof at the bifurcation of each side plate subjacent the upper perimeter of the sheave, the other end of each gate means extending upwardly of the side plates and including apertures for cooperation with latching means connected to suspension means, the portions of said side plates and said gate means located above the sheave being concave on the inner surfaces thereof.



3,275,302
DEVICE FOR STORING AND MIXING DENTAL AMALGAMS
Thomas J. Horton, P.O. Box 168, Farmville, N.C.
Filed Mar. 15, 1965, Ser. No. 439,823
3 Claims. (Cl. 259—72)

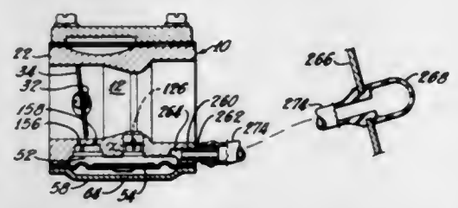
1. A device for storing and mixing dental amalgams comprising a body member having an open end and a closed end, a first chamber of given cross-sectional dimen-

sion formed within and adjacent to the closed end of the body member, a second chamber formed within and communicating with the open end of the body member, the two chambers communicating with each other at a position intermediate said ends of the body member, the second chamber being of greater cross-sectional dimension than the first chamber at said intermediate communicating position, a member loose within said second chamber but of sufficient size to close off said first chamber from the second chamber when the body member is maintained open end up, and a cap member fitted over the open end of the body member, the arrangement being such that a predetermined amount of mercury may be stored in said first chamber and a predetermined amount of alloy stored in the second chamber with the loose member separating same, and upon shaking of the device the loose member will become dislodged to permit mixing of the mercury and alloy to form an amalgam, with the loose member aiding in subdividing and mixing said materials to form the amalgam.



3,275,303
BLENDING
Robert R. Goins, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Oct. 5, 1964, Ser. No. 401,423
6 Claims. (Cl. 259—95)

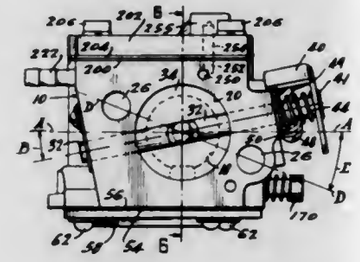
1. Solids blending apparatus comprising, in combination:
(a) a chamber having an inlet and outlet at substantially opposite ends thereof;
(b) a downwardly concave baffling means in a lower part of said chamber and spaced from the bottom of said chamber;
(c) at least one upright conduit positioned within said chamber to provide a passageway around said baffling means; and
(d) at least one pair of diametrically opposite openings having an upwardly convex baffle extending through same in each such conduit at a level above said conical baffling means.



3,275,304
BLENDING APPARATUS
Leon P. Brundrett, Houston, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed June 8, 1964, Ser. No. 373,472
2 Claims. (Cl. 259—180)

1. Apparatus for blending particulate, free flowing, granular material which comprises, in combination, a chamber having first, second, third and fourth wall forming members, said wall forming members being so adapted as to form an outlet from said chamber at one end thereof; inlet means to introduce the material to be blended to said chamber; first flow dividing means attached to said first and third wall forming members at a point approximate to said inlet means; first planar baffle means attached along one edge thereof to said first wall forming member and adapted to direct flow downwardly toward the interior of said chamber; second planar baffle means attached along one edge to said third wall forming member at a point below the lower edge of said first planar baffle means; third planar baffle means attached along one

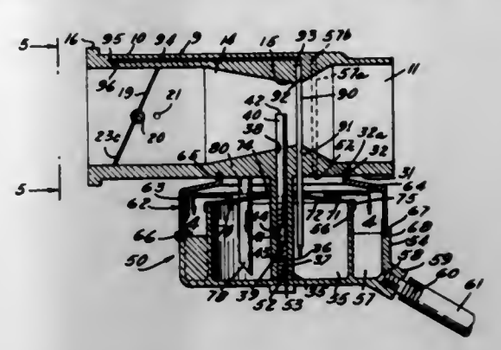
edge thereof to said fourth wall forming member and so adapted as to direct flow downwardly toward the interior of said chamber; fourth planar baffle means attached along one edge thereof to said second wall forming member and so adapted as to receive flow from said third planar baffle member and to direct flow downwardly toward the interior of said chamber; and second flow dividing means attached to said second and fourth wall forming members so adapted as to divide the flow from said fourth planar baffle means while directing same downwardly toward the interior and outlet of said chamber.



3,275,305
FUEL FEED AND CHARGE FORMING APPARATUS WITH PRIMING DEVICE
Warren D. Nutten, Erie, Mich., assignor to The Tillotson Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Filed May 3, 1965, Ser. No. 452,826
5 Claims. (Cl. 261—34)

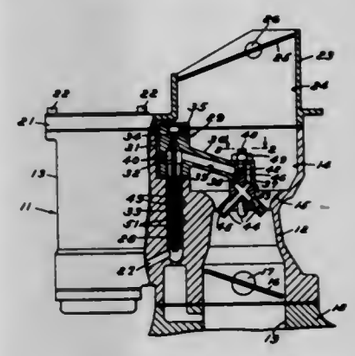
1. In combination, a carburetor having a mixing passage and an unvented fuel chamber, a throttle valve in the mixing passage, a flexible diaphragm forming a wall of the fuel chamber, a fuel inlet in the carburetor, an inlet valve for the inlet, motion transmitting means disposed between the inlet valve and the diaphragm whereby movement of the diaphragm controls the inlet valve to regulate flow of liquid fuel from a supply into the fuel chamber, passage means in communication with the fuel chamber for delivering fuel into the mixing passage, means including an auxiliary fuel storage member in communication with the fuel chamber manually actuable

by an operator for forcing auxiliary fuel into the fuel chamber to eject fuel in the fuel chamber into the mixing passage through said passage means, and means in said passage means to impede air flow from the mixing passage into the fuel chamber so that reduced pressure is established in said fuel chamber and said diaphragm is caused to open said fuel inlet valve.



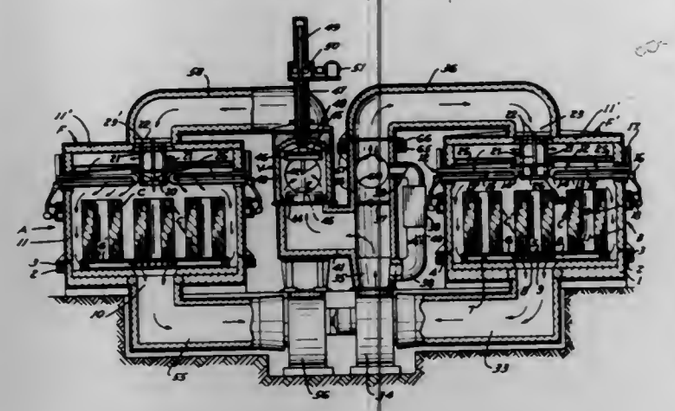
3,275,306
FUEL FEED AND CHARGE FORMING APPARATUS
Bernard C. Phillips, Toledo, Ohio, assignor to The Tillotson Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Filed Mar. 18, 1963, Ser. No. 265,691
9 Claims. (Cl. 261—35)

5. In a fuel system for an internal combustion engine, a carburetor body having a mixing passage and an unvented fuel chamber arranged at one side of the mixing passage, a throttle valve and a choke valve having shafts passing through the mixing passage, a fuel metering diaphragm forming one wall of the fuel chamber, a fuel inlet for said chamber formed in the carburetor body, an inlet valve for said fuel inlet, a lever fulcrumed in the fuel chamber arranged to transmit movements of the metering diaphragm to the fuel inlet valve for controlling fuel flow into the fuel chamber, resilient means biasing the inlet valve toward closed position, orifice means opening into the mixing passage, fuel channel means in said body for conveying fuel from said fuel chamber to said orifice means, a plate secured to the body and disposed at the opposite side of the mixing passage from the metering diaphragm, adjacent regions of the carburetor body and plate being formed with recesses, a pumping diaphragm between the plate and carburetor body and extending across the recesses forming therewith a fuel compartment in the carburetor body and a pulse chamber in the plate, means to connect the pulse chamber with a source of varying fluid pressure for actuating the pumping diaphragm, said throttle valve and said choke valve shafts being substantially parallel to each other and arranged at an acute angle with respect to a plane through the mixing passage parallel to the metering diaphragm, and manually adjustable means for metering fuel flow from the fuel chamber to the orifice means, said metering diaphragm being actuated by aspiration in the mixing passage to regulate fuel flow past the inlet valve.



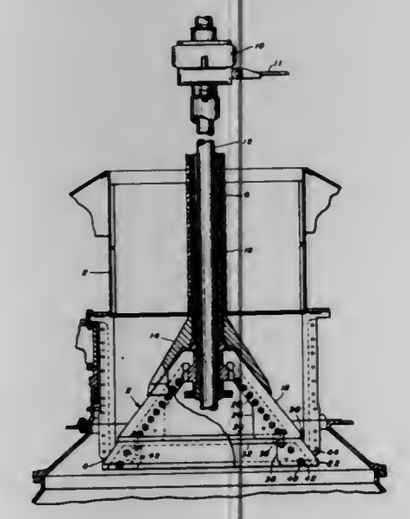
3,275,307
CHARGE FORMING DEVICE
Gerald C. Robechaud, Pacific Palisades, Calif., assignor to McCulloch Corporation, Los Angeles, Calif., a corporation of Wisconsin
Filed Aug. 2, 1963, Ser. No. 299,530
11 Claims. (Cl. 261—36)

3. In a charge forming device:
(A) a body having a horizontal induction passage therethrough;
(B) means for supplying fuel to said induction passage, said means including a tubular fuel passage;
(C) means defining a fuel chamber having a top wall with an overflow opening therein coaxial with said tubular fuel passage, said tubular fuel passage extending through said overflow opening, the latter



having a peripheral portion thereof about said tubular fuel passage for fuel overflow from said chamber; and
(D) fuel inlet means for said fuel chamber.

3,275,308
CHARGE FORMING DEVICE DISCHARGE NOZZLE
Michael J. Thomas, Dearborn, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Feb. 3, 1964, Ser. No. 342,182
5 Claims. (Cl. 261—78)



1. A charge forming device comprising an induction passage, a fuel source and a main fuel discharge for discharging fuel from said fuel source into said induction passage, said main fuel discharge including a discharge nozzle support extending into said induction passage and terminating along the longitudinal axis of said induction passage, a bore formed in said discharge nozzle support substantially along the longitudinal axis of said induction passage, a fuel channel extending through said discharge nozzle support and terminating at said bore, a fuel discharge nozzle having a stem portion extending coaxially of said bore and journaled therein, at least a section of said stem portion having a smaller external diameter than the internal diameter of said bore to provide an annual clearance therebetween, a plurality of discharge bars extending from said stem portion outwardly and downwardly into said induction passage, a discharge port extending through each of said discharge bars and communicating with said annular clearance, the upper end of said stem portion terminating adjacent an upper surface of said discharge nozzle support and being externally threaded, and a nut threaded upon said stem for retaining said discharge nozzle in an angularly adjusted position.

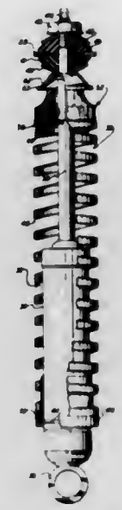
3,275,309
APPARATUS FOR HEATING METAL OBJECTS
Lee Wilson, Rocky River, and Paul R. Barenok, North Olmsted, Ohio, assignors to Lee Wilson Engineering Company, Inc., Cleveland, Ohio, a corporation of Ohio
Filed Apr. 8, 1964, Ser. No. 358,156
10 Claims. (Cl. 266—5)

1. Apparatus for heating metal objects including a base, a charge support on said base, a furnace bell on said base forming an enclosed furnace chamber therewith, said furnace bell having a top opening, said base having a bottom opening and said charge support being adapted to support a charge in said furnace chamber, atmosphere circulating means connecting said bottom opening in said base and said top opening in said furnace bell, heating means supported in said furnace bell and extending transversely thereof, said heating means having a radiant heating surface area disposed for direct radiant heating of a charge on said charge support, and atmosphere diffusion means comprising a plurality of inwardly extending inclined vanes having their adjacent longitudinal edges spaced apart and being supported by said furnace bell above said heating means on the side thereof opposite said radiant heating surface area.

3,275,310
BLAST FURNACE BELL
Ralph T. Hanna, Yardley, Pa., assignor to United States Steel Corporation, a corporation of Delaware
Filed Dec. 4, 1963, Ser. No. 327,925
2 Claims. (Cl. 266—27)

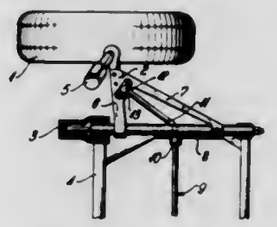
1. In a blast furnace, the combination including a hopper having a peripheral conical seat at its lower end, a generally conical bell within said hopper and extending below the bottom thereof, and means for raising and lowering said bell; said bell comprising two upper sections having a generally conical outer surface, a generally vertical flange on each end of each upper section, the flanges on each section having holes therein aligned with the holes in the adjacent flange of the other section, means in said aligned holes detachably fastening the two sections together, two lower sections having a generally conical outer sealing surface adapted to engage said peripheral conical seat, a generally vertical flange on each end of each lower section; the flanges on each lower section having holes therein aligned with the holes in the adjacent flange of the other lower section, means in said last named aligned holes detachably fastening the lower sections together, each of said upper sections having an inwardly extending peripheral flange at the bottom thereof, each of said lower sections having an inwardly extending peripheral flange at the top thereof, said horizontal flanges having holes therein, the holes in the horizontal flanges of the upper sections being aligned with the holes in the horizontal flanges of the lower sections, and means in said last named aligned holes detachably fastening the upper and lower sections together.

3,275,311
SPRING DEVICE
Ramon Hubert Eberstadt y Sichel, Mexico City, Mexico (Ap. Postal 310, Queretaro, Queretaro, Mexico)
Filed Apr. 22, 1964, Ser. No. 361,774
5 Claims. (Cl. 267—1)



1. A spring device including at least one base element, a plurality of tongues, each having two ends and an arcuate intermediate portion, one of said ends of each resilient tongue being secured to said base element, and the other of said ends of each resilient tongue slidingly engaging one surface of said base element. said base element comprising a sheet, an opening being defined in said sheet for each resilient tongue, each tongue being pressed from said sheet to define its associated opening, one end of each tongue being integral with said base element and having its arcuate intermediate portion overlying its associated opening, and each tongue being elongated in order that its other end slidingly engages said sheet in spaced relationship to its associated opening.

3,275,312
SHOCK ABSORBER AND AUXILIARY SPRING UNIT
Philip V. Monnin, Novi, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed June 4, 1964, Ser. No. 372,451
1 Claim. (Cl. 267—8)

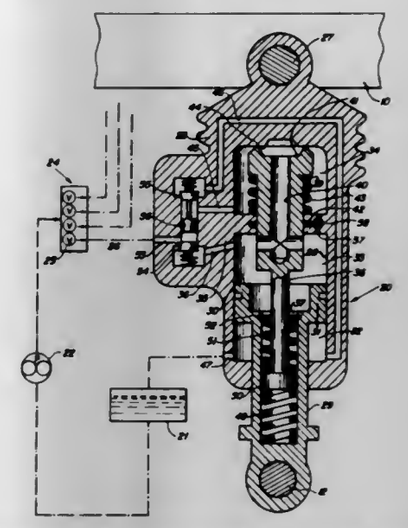


A vehicle suspension system having sprung and unsprung parts, a suspension spring interposed between said parts and constructed for resiliently supporting said sprung parts on said unsprung parts, a direct acting telescopic shock absorber interposed between said parts, said shock absorber having a body portion connected to one of said parts, said shock absorber also having a piston rod portion slidable with respect to said body portion and connected to the other of said parts, a spring seat secured to said body portion, a coil spring disposed concentrically about said body portion and having one end seated on said spring seat, a rubber retaining member connected to the other end of said coil spring, said rubber retaining member having a wall defining a central opening of greater internal diameter than the outside diameter of said piston rod portion, said piston rod portion being disposed within said opening, protruding portions extending radially inwardly from said wall and engaging said

piston rod portion, a stop member disposed near the end of said piston rod portion, said stop member having a generally concave surface spaced apart from said rubber retaining member when said shock absorber is in an extended rebound position, said rubber retaining member having an end with a convex surface constructed to engage said concave surface when said shock absorber is in a position between full jounce and full rebound, said

convex surface and said concave surface being of dissimilar curvature whereby when said rubber retaining member is moved into engagement with said stop member said rubber retaining member is distorted in a gradual progressive fashion, said rubber retaining member being compressed between the concave surface of said stop member and the end of said body portion when said shock absorber is in a full jounce position.

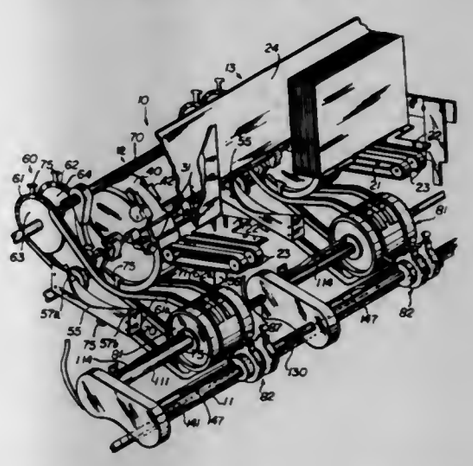
3,275,313
STABILIZER FOR VEHICLES
Hans Hoenick, Gerlingen, near Stuttgart, Germany, assignor to Firma Dr. Ing. h.c. F. Porsche KG, Stuttgart-Zuffenhausen, Germany
Filed Dec. 4, 1963, Ser. No. 328,028
Claims priority, application Germany, Dec. 13, 1962, P 30,762; Dec. 15, 1962, P 30,786
7 Claims. (Cl. 267—11)



1. A stabilizer arrangement for vehicles, especially motor vehicles having a vehicle superstructure, comprising integral fork-like wheel guide members, each including first and second arms diverging in V-shape and pivotally connected at spaced points to the vehicle superstructure for suspending a respective wheel at the vehicle superstructure,

and stabilizer means for stabilizing the vehicle and operatively connecting oppositely disposed wheel guide members,

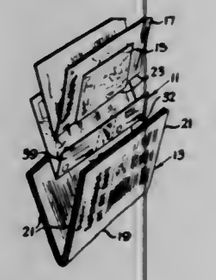
said stabilizer means being constructed as a torsion rod provided with crank arms, each extending entirely between the arms of the corresponding fork-like wheel guide member,



and means pivotally connecting each crank arm of the stabilizer means at the root of the arms of the corresponding fork-like wheel guide member.

3,275,314
FLUID CUSHION
Fritz Ostwald, Buchschlag, Germany, assignor to Alfred Teves, Maschinen und Armaturenfabrik K.G., Frankfurt am Main, Germany, a German company
Filed Sept. 1, 1964, Ser. No. 393,555
11 Claims. (Cl. 267—64)

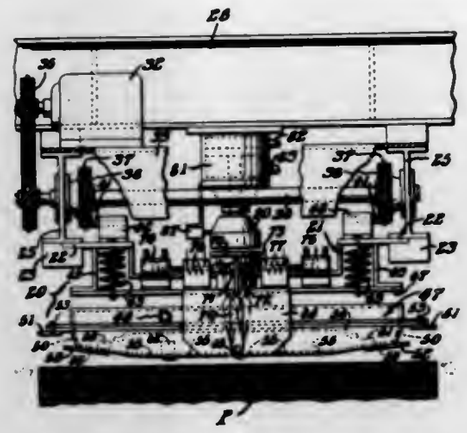
1. A fluid cushion comprising a cylinder provided with an inlet and an outlet for a working fluid, valve means in said outlet, biasing means urging said valve means into a position of closure, a conduit system including forced-circulation means connected to said inlet and outlet for driving said fluid through said cylinder, said valve means including a body with a face exposed to said fluid for partly overcoming the force of said biasing means under pressure of said forced-circulation means whereby said outlet is held open for the passage of said fluid at a controlled rate, and piston means in said cylinder movable relatively thereto under the action of a load for exerting a supplemental valve-opening pressure on the fluid in said cylinder upon any increase in said load, said piston means being linked with said valve means by a resilient coupling including at least part of said biasing means, said resilient coupling counteracting the valve-opening pressure exerted upon said face by the fluid in said cylinder.



3,275,315
SIGNATURE HANDLING MECHANISM
Victor A. Zugel, Parma, Ohio, assignor to Harris-Intertype Corporation, Cleveland, Ohio, a corporation of Delaware
Filed May 4, 1964, Ser. No. 364,647
11 Claims. (Cl. 270—54)

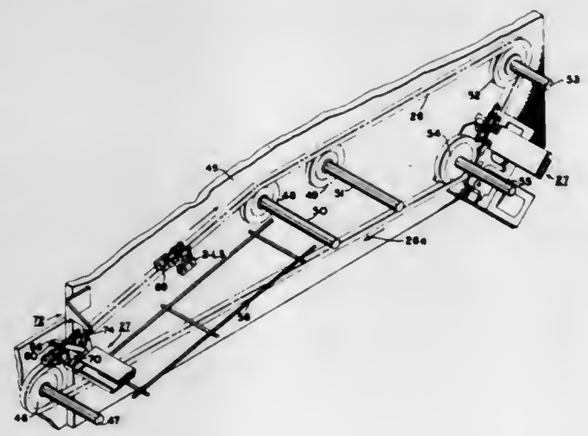
1. A signature handling mechanism comprising a magazine for supporting a supply of signatures on their folded edge and adapted to receive additional signatures upon

depletion of the signatures in the magazine, a signature transfer drum means operable to grip the folded edge of a signature and take the signature from the magazine and convey the signature around the periphery of the drum away from said magazine to a release point, support means having a support surface curved at least in part around a portion of said drum lying adjacent said release point for receiving and supporting a signature released therefrom, endless conveyor means having a run lying adjacent said release point and moving in a direction opposite the direction of rotation of said drum at said release point and associated with said support means for conveying a signature supported thereon to a signature opening station.



3,275,316
INSERT FOR NEWSPAPERS
Gerald V. Cleary, Jr., 463 Park Ave., Glencoe, Ill.
Filed Apr. 12, 1965, Ser. No. 449,684
14 Claims. (Cl. 270—57)

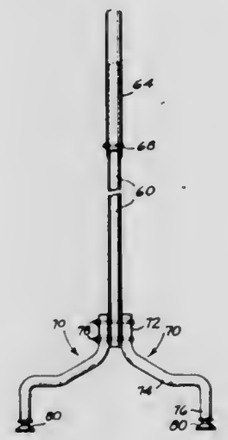
1. An assemblage of printed material comprising
A. an inner and an outer newspaper section each of which is folded along a major fold line and each of which includes lateral edges generally normal to said fold line,
(1) said sections being arranged within one another with at least one inner section being nested within the folds of an outer section and with the major fold lines of each the inner and the outer section being generally collinear,
B. and a single sheet insert adapted to carry an advertising message,
(1) said insert including a generally rectangular panel and a flap foldably attached to said panel along one edge thereof, one of said panel and flap having attached thereto a sample of a commercial commodity,
(a) said insert being disposed intermediate said inner and outer sections with the said one edge generally collinear with a major fold line of said outer section and with its panel and flap disposed on opposite sides of said inner section so as to cause the weight of said inner section to serve to retain said insert within said outer section without the use of fasteners,
(b) said panel and said flap on said insert each being dimensioned so as not to project outwardly past an edge of said assemblage.



3,275,317
METHOD AND MECHANISM FOR TRANSFERRING FABRIC BLANKS
Frank H. Fromm, Jr., 4215 State Road, Drexel Hill, Pa.
Filed May 1, 1964, Ser. No. 364,080
14 Claims. (Cl. 271—26)

13. In a fully automatic method of transferring precut fabric blanks one at a time from a pile thereof at a supply station to another station spaced from said supply station, the steps comprising lowering a pick-up head into engagement with the topmost blank, the effective size of the pick-up head being such that marginal areas of said blank project outwardly from thereunder, inducing suction through the sides of said pick-up head overlooking said marginal blank areas whereby to draw the marginal areas of said topmost blank toward and operatively hold the marginal areas of said topmost blank

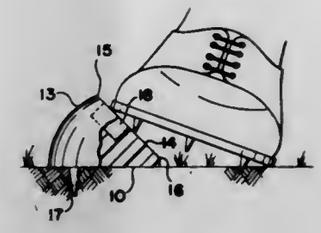
to said sides of the pick-up head, raising the pick-up head to lift said topmost blank from said pile of blanks, moving said pick-up head to said other station, cutting off the suction and thereby releasing the blank from said pick-up head for deposit at said other station, and returning said pick-up head to said supply station for removal of another blank from the pile thereof.



3,275,318
SHEET CONVEYING APPARATUS
Edward J. Lavander, Rochester, N.Y., assignor to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Oct. 30, 1964, Ser. No. 407,698
3 Claims. (Cl. 271—68)

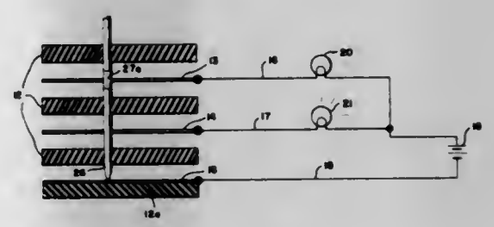
1. Apparatus for use in a device having side frames and pulley means mounted in said side frames supporting an endless conveyor of the type having a sheet gripper mechanism adapted to cyclically carry sheet material from sheet feeding stations to sheet delivery stations including:
biasing means in the sheet gripper mechanism to hold the gripper mechanism in a closed position;
a gripper lever mounted on the sheet gripper mechanism to open the gripper mechanism against the action of the biasing means;

an actuating lever positioned at the delivery stations adjacent the path of movement of the gripper mechanism movable into interfitting relation with the gripper lever to affect operation of the gripper mechanism;
means to move the actuating lever into interfering relation with the gripper mechanism;
a locking device on the gripper mechanism to lock the gripper in an open position against the action of the biasing means; and,
a releasing bracket mounted on the side frame at the sheet feeding stations to release the locking device to allow the gripper mechanism to close thereby gripping the sheet material inserted in the gripper mechanism.



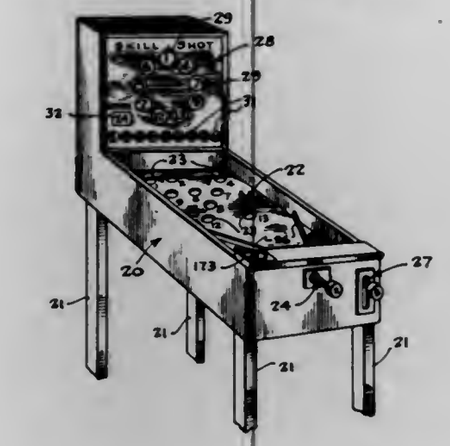
3,275,319
AMBULATORY AMUSEMENT AND EXERCISING DEVICE
Clarence A. Rost, 7720 SW. Cedar Lane, Portland, Oreg.,
Filed Aug. 7, 1964, Ser. No. 388,085
9 Claims. (Cl. 272—70.1)

1. An ambulatory amusement and exercising device comprising
(a) an elongated stem of sufficient strength to support a person when arranged in its vertical use position, the upper portion of the stem providing a hand grip,
(b) a cross piece,
(c) securing means for securing the cross piece to the lower portion of the stem,
(d) foot rest means on top of the cross piece, one on each side of the stem,
(e) and foot means on the bottom of the cross piece, one on each side of the stem,
(f) the foot rest means and foot means being disposed in a common transverse plane and the hand grip portion of the stem being disposed angularly forward with respect to said plane and with respect to an operator standing on the foot rest means wherein the one foot means on each side of the stem are the only engaging means between the device and the surfaces on which it is used.



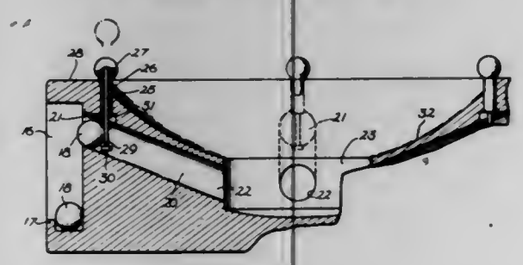
3,275,320
MAGNETICALLY LIFTABLE FOOT POSITIONING BLOCK FOR GOLFERS
John K. Hydock, R.D. 1, Byesville, Ohio
Filed Nov. 22, 1963, Ser. No. 325,551
3 Claims. (Cl. 273—32)

1. An anchor block for positioning the right foot of a golfer while swinging a golf club, said block having a flat base, spikes projecting downwardly from the base for penetrating into the ground, an inclined upper face on one side of the block for tilting the overlapping foot of a golfer standing thereon, and a magnet embedded in the



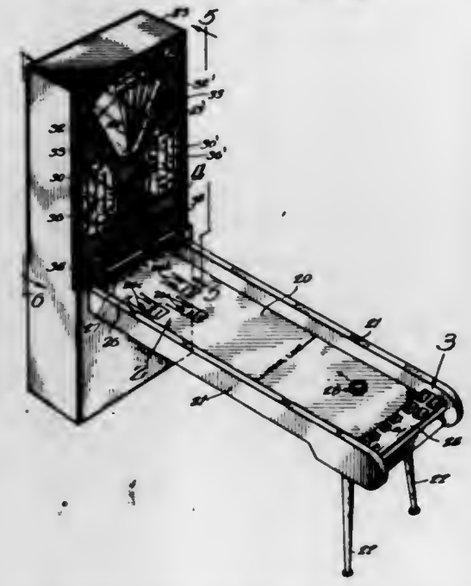
upper surface of said block and having its upper surface exposed, said magnet having sufficient attracting power to permit the block to be lifted by means of a golf club having its metallic head in contact with said magnet.

3,275,321
TARGET APPARATUS WITH DISCRIMINATING ELECTRICAL INDICATOR, AND PROJECTILES THEREFOR
Gerard M. Forest, 3802 Greenly St., Wheaton, Md.
Filed Jan. 30, 1964, Ser. No. 341,197
8 Claims. (Cl. 273—102.2)



4. A target apparatus comprising: a plurality of target sections each comprised of a ground or return conductive layer, a plurality of charged conductive layers spaced from said ground or return conductive layer and from each other, layers of easily penetrable and insulating target material between said conductive layers; a power supply; said ground or return conductive layer being electrically coupled to one side of said power supply, each of said charged conductive layers being electrically coupled to the other side of said power supply; and a plurality of signal or indicator means corresponding to the plurality of charged conductive layers and being different from each other, a signal or indicator means being coupled in the electrical coupling between each charged conductive layer and said power supply, the rearmost layer being impenetrable by pointed projectiles, and the other layers being easily penetrable by such projectiles; whereby the various signal or indicator means will be energized when there is embedded in the target the pointed nose of one of a plurality of different types of projectiles corresponding to the plurality of charged conductive layers, the pointed nose being of conductive material, and said projectile nose having uninsulated portions thereon at points which will contact the ground or return layer and only one of the charged conductive layers and having insulation thereon at the points which will contact the other charged conductive layers when the projectile comes to rest in the target, the uninsulated portions which contact the charged conductive layers being at a different position on each different type of projectile.

3,275,322
AMUSEMENT DEVICE WITH CHANGEABLE SCORE CONTROL MECHANISM
Walter M. Burnside, 324 S. Orchard, Waukegan, Ill.
Filed Apr. 14, 1964, Ser. No. 359,748
8 Claims. (Cl. 273—119)

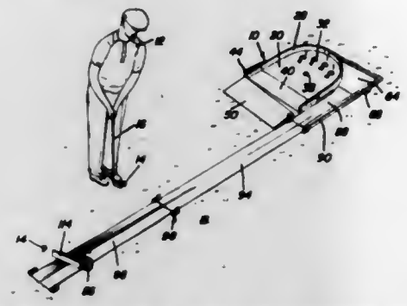


1. In an amusement device which includes a generally flat play field having a plurality of targets thereon and an object which can be propelled onto a play field to contact one of said targets, a plurality of target switches associated with each of said targets and wherein one of said target switches is adapted to be activated when one of said targets is contacted by one of said objects propelled on said play field, and a score register means operatively connected with said target switches and adapted to be activated when a target switch is closed and indicate a score value, the improvement comprising; means for selecting at least one winner target having a nominal score value, means for automatically selecting by chance a score value multiplying integer for increasing said nominal score value, and score counter means operatively associated with said score multiplier means and said target switch for actuating said score register means and indicating a score total which is a multiple of said score value.

3,275,323
GUESSING GAME DEVICE
Robert K. Achen, 6531 Greenbush Ave., Van Nuys, Calif.
Filed July 3, 1964, Ser. No. 380,162
6 Claims. (Cl. 273—120)

1. A game device comprising;
a body having a plurality of compartments for containing the objects to be used in the game;
each compartment being assigned to an individual player and the objects therein concealed from all the other players;
a common display surface associated with said body and observable by all the players;
and concealed passage means associated with each compartment for receiving an object selected by a player from the compartment while still concealing the object from all the other players; and
means for selectively releasing said selected object while still concealed for passage through said passage means onto said common display surface.

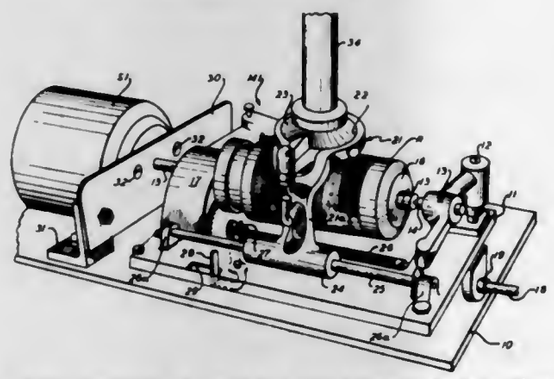
3,275,324
SURFACE PROJECTILE GAME HAVING ADDITIONAL TARGET SCORING MEANS
Walter M. Burnside, 324 S. Orchard, Waukegan, Ill.
Filed Sept. 8, 1964, Ser. No. 394,734
16 Claims. (Cl. 273—126)



1. An amusement apparatus comprising
(a) a playing table having a plurality of target objective switches adapted to be actuated by a playing piece aimed thereat,
(b) a pair of adjacent vertical channels communicating with each other at their upper ends and each arranged to receive a plurality of balls in stacked relation,
(c) a ball projector disposed at the lower end of one of said channels and adapted to project a ball upwardly and into the other of said channels,
(d) a movable gate associated with the other of said channels and arranged when actuated to release any balls disposed therein, and
(e) means operatively connecting said ball projector and said movable gate to respective ones of said target switches whereby actuation of a switch by a playing piece will effect actuation of either of said ball projector or said movable gate, respectively.

11. In an amusement apparatus,
(a) a plurality of target objective switches radially and arcuately arranged and adapted to be actuated by a playing piece aimed thereto,
(b) a seat for supporting said playing piece and disposed in substantially close proximity to the radial center of said switches,
(c) a projector oscillatable about an axis substantially coincident with said center and adapted to project a playing piece from said seat against one of said target objective switches,
(d) means for actuating said projector, and
(e) means for varying the position of said seat in relation to said projector with each actuation of said projector whereby to vary the path of travel of a projected playing piece.

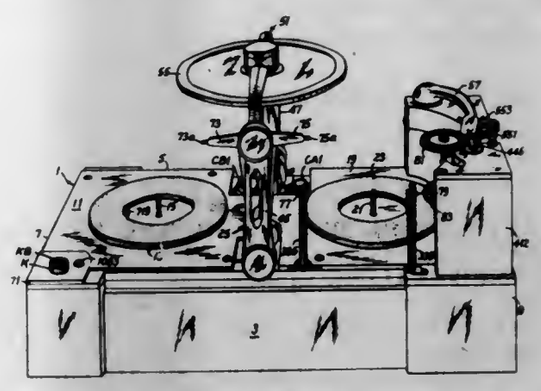
3,275,325
GOLF PUTTING TRAINER
Kenneth W. MacKenzie, Rte. 2, Box 412–C, Acampo, Calif.
Filed Apr. 8, 1964, Ser. No. 358,207
5 Claims. (Cl. 273—179)



1. A golf putting training aid comprising an inclined ramp having an approach edge orientated adjacent the supporting surface whereby golf balls may be projected onto the ramp, an arcuate retaining wall extending upwardly from the ramp in spaced relation to the approach

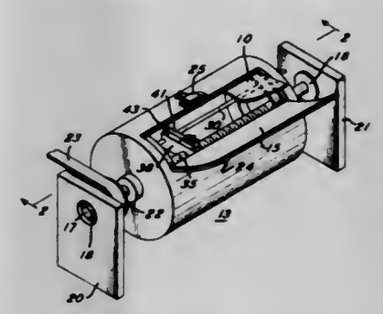
edge thereof for retaining golf balls projected onto the ramp, said ramp having a plurality of openings therethrough through which a golf ball may pass, means supporting the ramp in inclined position, and means underlying the openings through the ramp for collecting golf balls passing therethrough and returning the golf balls in a lateral direction and alongside of the ramp for returning them to an area from which they are projected, said ramp being provided with a centrally disposed recess incapable of passing a golf ball but sufficient to retain the

golf ball if it rolls slowly thereover thereby providing a difficult target for the golf ball, obstacles provided on the ramp adjacent the openings for increasing the difficulty of passing the golf balls therethrough, the approach edge of said ramp being provided with an approach ramp spaced slightly therefrom and including an abutment edge spaced from the approach edge, said abutment edge being inclined away from the approach edge laterally thereof for returning golf balls laterally when they roll back down the ramp.



3,275,326
METHOD AND APPARATUS FOR MAKING PHONOGRAPHIC RE-RECORDINGS
Walter L. Welch, 919 Onondaga Ave., Syracuse 7, N.Y.
Filed Oct. 22, 1963, Ser. No. 318,009
8 Claims. (Cl. 274—3)

3. The method of making improved re-recordings of original recordings which comprises selecting duplicate records produced from the same master, reproducing said duplicate records simultaneously while maintaining the same in a synchronized out-of-phase relationship adapted to effect a substantial cancellation of signal noises, and recording on a new record medium the electrical sound-representing signals from said respective duplicate records.



3,275,327
RECORD PLAYER
Arlie L. Brown, Cleveland, Ohio, Norbert F. Cook, Berkeley, Mo., Harry E. Hackney, Cleveland, Ohio, Edward J. Hulsey, Jennings, Carl H. Mueller, Pasadena Hills, and Jerome B. Wegmann, Florissant, Mo., and Wilfred C. Swanker, Bay Village, Ohio, assignors to McNeil Corporation, Akron, Ohio, a corporation of Ohio
Filed July 14, 1961, Ser. No. 124,159
50 Claims. (Cl. 274—10)

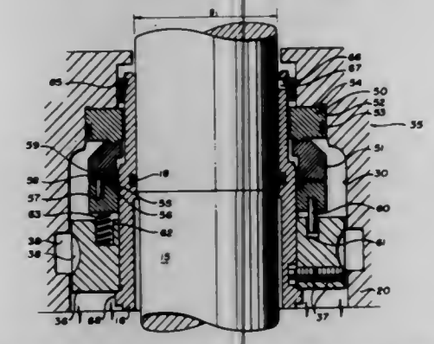
1. A record player comprising a turntable carrier, a turntable carried by the carrier for movement relative to the carrier between an inverted position and an upright position, said turntable having means for gripping a record, and means for moving said carrier to bring the turntable in inverted position over to a stack of records

to grip and pick up a record, then moving said carrier to bring the turntable over to a record playing position for playing the upper side of the record on the inverted turntable, and then turning the turntable to upright position for playing the other side of the record.

3,275,328
RECORDING AND PLAYING DEVICE AND METHOD FOR SOUND RECORD
Gyula J. Varga, 314 Locust Drive, Phoenixville, Pa. 19460
Filed Jan. 20, 1964, Ser. No. 338,656
8 Claims. (Cl. 274—20)

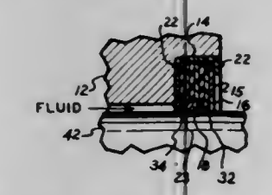
1. In combination
a hollow rotatable cylinder having an inner cylindrical surface for the interior reception of a flexible sound record,
said cylinder having a longitudinally pivotal side wall door providing part of said inner cylindrical surface and through which the record may be inserted and withdrawn,
said cylinder having inner annular end recesses for positioning and holding the record,
a member for rotating said cylinder,
a magnetic pick-up head for said sound record,
a longitudinal guide in said cylinder along which said head is movable,
a threaded shaft coaxial with said cylinder, and
a member connected to said head and engaged with said shaft for translating said head in either direction.

3,275,329
CASE FOR PRINTING TYPE
Heiman G. Lieberman, Evansville, Ind., and Jay Benjamin Lieberman, White Plains, N.Y. (6050 Kennedy Blvd. E., West New York, N.J. 07093); said Heiman G. Lieberman assignor to said Jay Benjamin Lieberman
Filed July 26, 1965, Ser. No. 474,612
3 Claims. (Cl. 276—44)



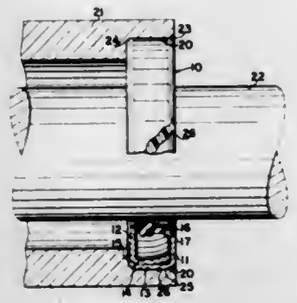
1. A portable case for printing type comprising a plastic body member having upturned edges, a plastic re-

movable integral innerliner having a plurality of variable size printing type-receiving cavities defined by pli-



able partitions therebetween, and a plastic cover seletively sealing said printing type in said cavities.

3,275,330
HIGH PRESSURE SHAFT SEAL AND METHOD OF SEALING A ROTATING SHAFT USING PROPORTIONED SEALING RINGS
Edward N. Rein, Portland, Oreg., and Robert E. Dolman, Newark, Del., assignors to Guy F. Atkinson Company, Portland, Oreg., a corporation of Nevada
Filed July 16, 1962, Ser. No. 210,140
2 Claims. (Cl. 277—1)

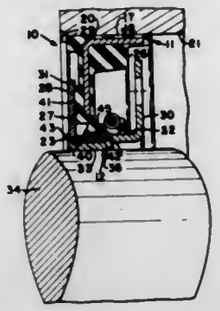


1. A method of sealing a rotating shaft penetrating a fixed housing against egress from said housing of fluid under high, variable pressure, said method comprising: providing a first ring secured and sealed to said housing and coaxial with said shaft; providing a second ring surrounding said shaft, supporting said second ring adjacent its inside edge on a resilient O ring, said second ring being movable axially thereof and having an annular surface confronting a meeting surface on said first ring; urging said surfaces into contact by the application of resilient mechanical force; subjecting selected portions of the surface of both said rings to the high, variable pressure of the fluid to be restrained against egress from said housing; and selecting the contours and proportions of at least said second ring so that in each radial cross-section of said second ring the resultant of all external forces acting on said second ring passes substantially radially inward and substantially through the centroid of the radial cross-section of said second ring.

3,275,331
SEAL AND METHOD OF MANUFACTURE
Alex A. Mastrobattista, Dunellen, N.J., and William J. Fordon, New York, N.Y., assignors to Johns-Manville Corporation, New York, N.Y., a corporation of New York
Filed Dec. 21, 1962, Ser. No. 246,549
11 Claims. (Cl. 277—1)

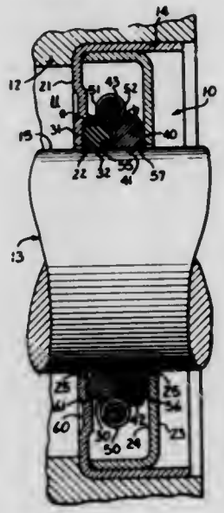
1. Cartridge-type sealing means for interposition between relatively movable parts comprising:
a casing adapted to fit between said parts and for fixed relation with one of said parts; and
a lamination of essentially thin annuli, each of the annuli having a radial width greater than its thickness, and being disposed radially intermediate of said casing and another of said parts,
at least one of said annuli being of inert synthetic resinous material having a low coefficient of friction and having a radial dimension compared to a corresponding radial dimension of said other of said parts to be in at least tangential line contact therewith, and
at least one of said annuli being of elastomeric material having a radial dimension substantially corresponding to said radial dimension of said resinous annulus being adapted to resiliently maintain said resinous annulus in contact with said other part, and being positioned to establish at least line contact with said other part as said resinous annulus wears.

3,275,332
OIL SEAL
Evalyn S. May, Redwood City, Calif., assignor to Federal-Mogul Corporation, a corporation of Michigan
Filed Mar. 2, 1964, Ser. No. 348,697
5 Claims. (Cl. 277—37)



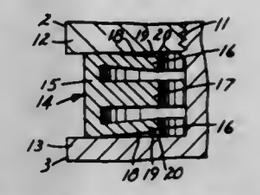
1. In oil seals for use in providing a substantially fluid-tight seal between a movable shaft member and a housing member having a bore through which said shaft extends and wherein said seal is provided with a cylindrical surface adapted to have a press fit with one of said members, the improvement comprising a thin layer, at least as thick as the average surface roughness of said bore, of cured chlorosulfonated polyethylene bonded to said cylindrical surface, said material responding to high shearing and pressure forces so that when such forces act during the assembly of the seal into the bore of a housing member they cause said material to move and fill imperfections in the bore wall and form a fluid-tight seal therewith as well as a strong joint between said oil seal and the bore wall, with any excess remaining coherent and balling rather than crumbling.

3,275,333
DUAL LIP UNITIZED SEAL
Arthur M. Scott, Redwood City, and Robert N. Haynie, Los Altos, Calif., assignors to Federal-Mogul Corporation, Detroit, Mich., a corporation of Michigan
Filed Aug. 2, 1963, Ser. No. 299,546
10 Claims. (Cl. 277—39)



1. A unitized oil seal for use between two relatively rotating machine parts, including in combination:
first and second metal wear sleeve members nested and locked together,
said first member having a first radial flange and a first axial portion, said first axial portion being stepped to provide a first cylindrical portion nearer said first flange and a second cylindrical portion engaging one of said relatively rotating machine parts and more distant from said first flange and of different diameter than said first cylindrical portion and meeting that portion at a step, said first axial portion terminating in a locking rim,

said second member having a second radial flange and a second axial portion, which is cylindrical and nests with said second cylindrical portion and of substantially the same length, engaging said step, said locking rim directly engaging said second radial flange so that said first and second radial flanges are at the

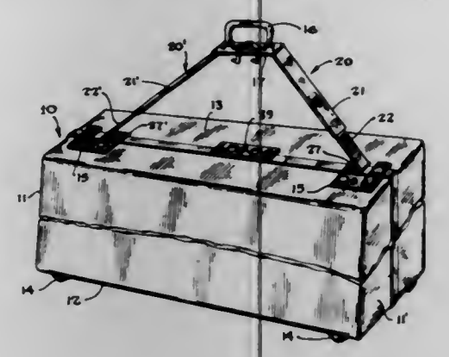


opposite ends of said first axial portion, so that the width of the oil seal is substantially the distance between said first and second radial flanges, and
a sealing member having lip means engaging said first cylindrical portion and means for non-rotatively engaging the other of said machine parts.

3,275,334
O-RING ROTARY SEAL CONSTRUCTION
Robert M. Voitik, Glenview, Ill., assignor to Continental Illinois National Bank and Trust Company of Chicago as trustee
Filed Dec. 18, 1963, Ser. No. 331,497
5 Claims. (Cl. 277—41)

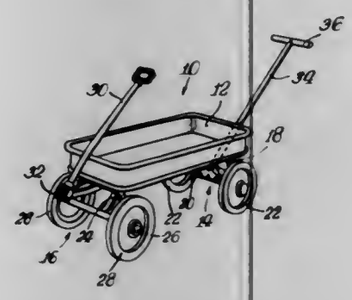
1. In a cartridge-type seal for insertion in the annular space between a shaft and a frame opening defining first and second concentric cylindrical surfaces, the combination comprising an annular cartridge having a first wall and a second wall, said walls being fixedly mounted with respect to the first cylindrical surface and extending to within the vicinity of the second cylindrical surface to define an annular clearance space with respect to the latter, an O-ring presenting arcuate sealing surfaces in engagement with the first wall of the cartridge and the second cylindrical surface respectively, a retaining ring of plastic or the like arranged adjacent the O-ring for mounting on said second cylindrical surface, said O-ring and retaining ring having adjacent portions of approximately the same radial thickness profiled to define a shallow annular valley between them, a garter spring in said valley, said garter spring being prestressed to exert both the retaining ring and O-ring angled forces having radial components in the same direction as well as axial components in opposite directions, said retaining ring being in gripping engagement with the second cylindrical surface to preclude relative movement between the O-ring and retaining ring.

3,275,335
HIGH PRESSURE SEAL
Billie L. Johnson, Canoga Park, and James A. Boyd, Brea, Calif., assignors to Donaldson Company, Inc., Minneapolis, Minn., a corporation of Delaware
Filed Mar. 18, 1963, Ser. No. 265,884
1 Claim. (Cl. 277—180)



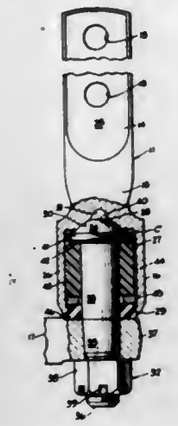
A one-piece annular pressure seal of hard resilient material adapted to be interposed between opposed flat annular surfaces of a pair of cooperating members, said seal comprising:
(a) an axially extending cylindrical portion having a predetermined axial dimension,
(b) a pair of annular end flanges of predetermined axial thickness projecting radially in a common direction from opposite ends of said cylindrical portion and being parallel to each other and having axially outer surfaces normally disposed in parallel planes transversely of the axis of said cylindrical portion,
(c) an annular reinforcing flange of substantially uniform axial thickness substantially greater than that of either end flange between radially inner and outer portions thereof disposed centrally between and in axially spaced parallel relation to said end flanges, all said flanges being of equal radial extent,
(d) and a pair of annular sealing lips one each projecting axially outwardly from the axially outer surface of a different one of said end flanges at the radial edge portion thereof radially spaced from said cylindrical portion,
(e) said sealing lips having axially outwardly facing flat annular sealing surfaces for sealing engagement with respective ones of the annular surfaces of said cooperating members and normally spaced apart a distance greater than the axial dimension of said cylindrical portion,
(f) the axial spacing between said reinforcing flange and each of said end flanges being greater than the axial dimension between each annular sealing surface and the axially outer surface of its respective end flange,
(g) the arrangement being such that, when said sealing surfaces are moved toward each other by pressure of said cooperating members thereagainst to the extent that said members bear against the ends of said cylindrical portion, deflection of said end flanges does not exceed the elastic limits of said end flanges, and said reinforcing flange and end flanges remain in axially spaced apart relationship.

3,275,336
EXTENDABLE ATTACHMENT FOR LUGGAGE
John W. Warner, Jr., 717 Keith Ave., Waukegan, Ill.
Filed Jan. 30, 1964, Ser. No. 341,312
10 Claims. (Cl. 280—43.24)



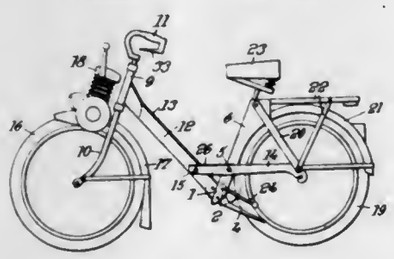
1. In a hand luggage having bearing means on a lower wall surface to facilitate moving said luggage along a supporting surface, an extension attachment secured to longitudinally spaced anchor means fixedly mounted on a wall of said luggage opposite said lower wall surface which comprises; spaced arm members with each of said arm

members being hingeably secured at one end to one of said anchor means, each said arm member having an extension section in telescopic slidable engagement therewith and having one end extendable beyond the said arm member to a predetermined limit, each said arm member and each of said extension section being normally



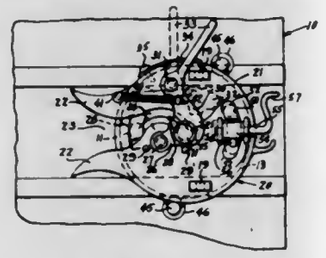
held in a plane substantially parallel with the plane of said wall and in close proximity thereto, and a hand grip means hingeably secured to the extension sections; whereby said hand grip means can be substantially elevated from a position of close proximity to said wall into a position substantially above the level of said wall when said arm members are hingeably moved away from said wall.

3,275,337
AUXILIARY HANDLE FOR COASTER WAGON
Gary K. Lau, 1407 Emerald Ave., Chicago Heights, Ill.
Filed Aug. 13, 1964, Ser. No. 389,305
1 Claim. (Cl. 280—87.1)



For use with a coaster wagon having a rear axle, a handle mounting block having a semi-circular recess formed in one end thereof disposable longitudinally in engagement with the rear axle of the coaster wagon, a first hinge element secured to one side of said mounting block, a second hinge element pivotally joined to said first hinge element, said second hinge element being positionable along said one edge of said mounting block and having a semi-circular recess formed therein disposable longitudinally in engagement with the rear axle of the coaster wagon, a third hinge element pivotally joined to said second hinge element, means for releasably securing said third hinge element to the other side of said mounting block with the rear axle of the coaster wagon being engaged between the semi-circular recesses of said mounting block and said second hinge elment, an auxiliary handle, and means pivotally mounting one end of said auxiliary handle to said mounting block whereby said auxiliary handle is permitted to extend rearwardly and angularly upwardly with the other end thereof being freely movable laterally while said auxiliary handle is being used to push the coaster wagon.

3,275,338
IDLER ARM BRACKET AND SOCKET ASSEMBLY
Edward J. Herbenar, Detroit, and Alvin W. Alexandrowicz, St. Clair Shores, Mich., assignors to TRW Inc., a corporation of Ohio
Filed Jan. 10, 1963, Ser. No. 250,607
17 Claims. (Cl. 280—95)

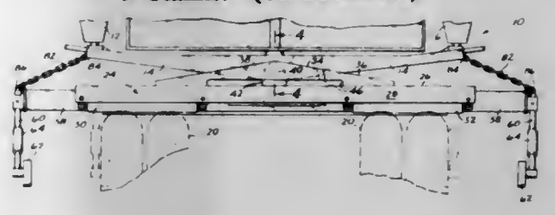


11. In a steering linkage assembly, an idler arm assembly, comprising,
- an integral bracket and socket member having a bracket portion at one end and a cylindrical socket portion at the other end axially offset from said bracket portion,
- said socket portion having a cylindrical wall defining a coaxial socket closed at its inner end and open at its outer end,
- a pivot assembly within said socket including a pivot pin having an inner headed end and a link-connecting end externally of said socket,
- a separate load-carrying bearing, of a thermoplastic resin, having a low coefficient of friction and good noise-damping properties positioned between said socket inner end and said headed pivot end,
- a thermoplastic resin bushing having a low flex modulus surrounding said pin within said socket, and means including an inturned annular flange on the outer end of said socket wall retaining said pivot assembly in said socket and said bushing under compressive load.

3,275,339
FRAMES OF BICYCLES, ESPECIALLY IN THOSE OF BICYCLES PROVIDED WITH AN AUXILIARY ENGINE
Bernard René Mennesson, Neuilly-sur-Seine, France, assignor to Societe d'Appareils de Controle et d'Equipement des Moteurs S.A.C.E.M., Neuilly-sur-Seine, France, a French society
Filed Dec. 22, 1964, Ser. No. 420,273
Claims priority, application France, Dec. 31, 1963, 959,118
7 Claims. (Cl. 280—281)

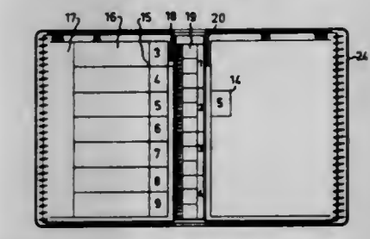
1. A frame for a bicycle comprising a slanted front strut carrying in its upper part a sleeve for journalling the steering parts of the bicycle, a saddle support slanted in a direction opposite to that of said front strut, a substantially horizontal rear fork rigidly secured, on the one hand, by its own front extremity to said front strut above the lower extremity thereof and, on the other hand, at the lower extremity of said saddle support, said bicycle frame further comprising a rigid sole slanted in the same direction as said saddle support for carrying the housing of the crank-gear, said rigid sole being rigidly secured by its upper end to both the lower extremity of said saddle support and the horizontal fork, and by its lower end to the lower extremity of said front strut, whereby said sole, a portion of said front strut starting from its lower extremity and a portion of said horizontal fork starting from its front extremity define a rigid triangle.

3,275,340
FIFTH WHEEL SAFETY DEVICE
Aurelio Sancioni, Rte. 1, Box 277, Corning, Calif.
Filed Dec. 3, 1964, Ser. No. 415,751
7 Claims. (Cl. 280—432)



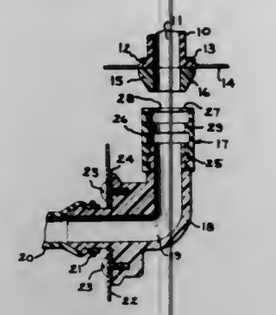
1. In combination with a tractor carrying a fifth wheel and a trailer having a depending king pin, a safety device comprising an elongated arcuate slot in said fifth wheel whereby the king pin engages against a portion of the side wall of the arcuate slot when a pulling force is exerted by the tractor, a pair of jaw members having complementary semi-circular jaw surfaces engaging around the king pin when closed, pivoted to the upper side of said fifth wheel on opposite sides of said slot, a handle member secured to one of said jaws and means for securing said handle to prevent release of said one jaw, the other jaw being held in locked position by said one jaw.

3,275,341
AGRICULTURAL IMPLEMENT TOOL BAR
Harold A. Ralston, Rockford, Ill., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Filed Jan. 21, 1964, Ser. No. 339,167
8 Claims. (Cl. 280—460)



1. A carrier for a tool bar of the type comprising a long slender rod of angular cross section adapted to selectively support and propel a variety of ground working implements clamped in spaced relation therealong, said carrier including a
- girder having a bending and torsional resistance largely in excess of that of said rod, disposed substantially parallel thereto,
- clamp means spaced along the length of said girder, rigidly attached thereto, and rigidly attached to said rod to interconnect the rod and girder whereby implements may be conveniently clamped to said rod selectively at many points without interference from said means while said rod is strengthened against bending and twisting by said means spaced along said girder, and
- means on said girder including forwardly and downwardly extending plates for connection to a vehicle for supporting and propelling said carrier.

3,275,342
MECHANISM FOR ATTACHING TRAILING AND LEAD VEHICLES
Jack D. Layton, Salem, Oreg., assignor to Layton Manufacturing Co., Salem, Oreg., a corporation of Oregon
Filed June 15, 1964, Ser. No. 374,899
9 Claims. (Cl. 280—460)



1. Mechanism for attaching trailing and lead vehicles comprising, and in combination with the frame of the trailing vehicle,
- an elongated arm mounting extending transversely of the forward end of the trailing vehicle,
- means connecting said mounting and the frame of the trailing vehicle permitting relative pivotal movement of the mounting about a substantially vertical axis and shifting of the arm mounting in a direction extending longitudinally thereof and laterally of the trailing vehicle,
- a pair of oppositely disposed arms extending forwardly of said mounting and movably supported on said mounting adjacent its opposite ends, respectively, for movement toward and away from each other,
- means linking each arm and the frame of the trailing vehicle affording limited play of the arm relative to said frame, and
- power-operated means mounted on said mounting for extending said arms from opposite ends of said mounting to the extent afforded by the linking means interconnecting the arms and frame.

3,275,343
CALENDAR DEVICE
Per Tore Holm, Granvagen 5, Skoghall, Sweden
Filed June 4, 1964, Ser. No. 372,603
Claims priority, application Sweden, June 5, 1963, 6,202/63
6 Claims. (Cl. 281—17)

1. A calendar system including a first calendar comprising at least one leaf, several markings on said leaf each corresponding to one of several equal parts of a definite time period and arranged along one side edge of said leaf, a second calendar comprising a multi-leaf calendar pad, means mounting said first and second calendars with one side edge of said multi-leaf pad extending along said one side edge of the leaf of said first calendar, a marking on each of the leaves of said second calendar said latter markings each corresponding to one of said equal parts of said definite time period and being distributed along said one side edge of said calendar pad opposite the respective ones of the markings of said first calendar.

3,275,344
MISALIGNMENT COMPENSATING COUPLING
Norman L. Kendt, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed Feb. 19, 1965, Ser. No. 433,943
1 Claim. (Cl. 285—9)

A coupling to provide a substantially fluid-tight seal between two relatively movable fluid-conducting conduits which compensates for axial and lateral misalignment of the conduits comprising:

(a) a first coupling member having an axial bore secured to one of the two conduits and having a generally conical engaging surface;

(b) a second coupling member comprising a flexible elongated tubular portion secured to the other of the two conduits at one end and including:

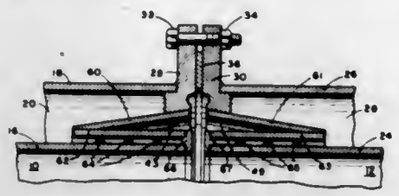
(1) a substantially radially inwardly-extending annular flange of greater flexibility than said tubular portion at its other end defining an opening of substantially the same diameter as said bore and adapted to be engaged by said engaging surface as said first and second coupling members are brought together to form a coupling,

(2) one or more annular ribs on the inner surface of said tubular portion for increasing the resistance to deformation of the parts of the tubular portion immediately adjacent any one of said one or more annular ribs,

(3) said inwardly-extending annular flange and the parts of said tubular portion not immediately adjacent any one of said one or more annular ribs being readily deformable upon contact by said engaging surface to compensate for axial or lateral misalignment of the two conduits.

3,275,345
CONDUIT SYSTEM AND COUPLING MEANS THEREFOR, FOR CONVEYING CRYOGENIC FLUIDS
Stoddard S. Waldron, Woodland Hills, and Gustave A. Bleyle, Jr., Pacific Palisades, Calif., assignors to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed Mar. 30, 1964, Ser. No. 355,834
9 Claims. (Cl. 285—47)

1. A termination for conduit means comprising an inner hollow conduit for conveying a liquefied gas and an outer hollow conduit surrounding said inner conduit and spaced therefrom for defining an evacuated space therebetween, said termination being adapted for coupling to another termination of identical configuration, said termination comprising:

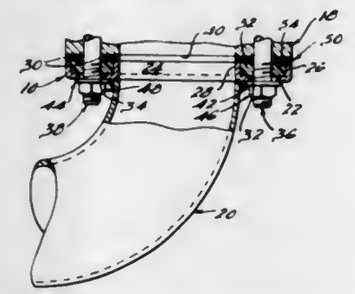


(a) respective one ends of each of said conduits positioned adjacent one another approximately in a common plane;

(b) flange means mounted on and extending outwardly from said outer conduit adjacent said one end thereof; and

(c) means sealing said ends together and including:

(i) at least one substantially rigid, hollow, frustoconical member sealed at one extremity to one of said ends and extending into said evacuated space,



(ii) at least one substantially rigid, hollow, elongated substantially cylindrical member

sealed at one of its extremities to the other of said ends, and at the other of its extremities to the other extremity of said frustoconical member, and

(iii) at least one circumferential reinforcing ring mounted on and extending from said elongated member toward the conduit to which said extremity of said elongated member is sealed.

3,275,346
FLANGE
Paul V. Gregg, Racine, Wis., assignor to Walker Manufacturing Company, Racine, Wis., a corporation of Delaware
Filed June 8, 1964, Ser. No. 373,448
1 Claim. (Cl. 285—49)

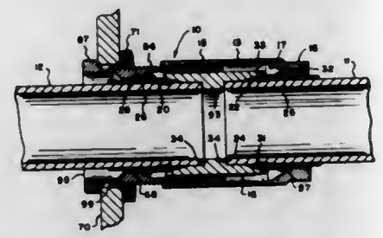
A pipe flange for connecting the exhaust pipe to the exhaust manifold of an automotive engine,

said flange comprising a flat oval-shaped base section which defines a central exhaust gas opening and a pair of manifold stud-receiving apertures on the opposite sides of said opening,

said flange being formed with skirt section projecting perpendicularly away from said base section and extending around the outer periphery of said base section,

said flange being further formed with an extrusion section projecting perpendicularly away from said base section in the same direction as said skirt section and disposed around the periphery of the said central opening,

the outer ends of said skirt section and said extrusion section defining a gasket seating surface,



the cavity defined by said base section, extrusion section and said skirt section being at least partially filled with the plastic resin sound-deadening material,

said flange being welded to the exhaust pipe around the periphery of said central opening and on the opposite side of said base section from said skirt section and said extrusion section,

means including bolt means extending through said apertures for connecting said flange to said manifold, and

gasket means interposed between said seating surface and said manifold.

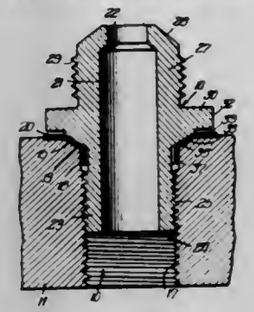
3,275,347
COUPLING FOR CONDUITS THROUGH BULKHEADS
William James Scott, Costa Mesa, Calif., assignor to General Dynamics Corporation, San Diego, Calif., a corporation of Delaware
Original application July 25, 1958, Ser. No. 750,993, now Patent No. 3,135,537, dated June 2, 1964. Divided and this application Apr. 8, 1964, Ser. No. 358,174
The portion of the term of the patent subsequent to June 2, 1981, has been disclaimed
1 Claim. (Cl. 285—161)

A coupling for joining conduits of the flareless end type through a bulkhead comprising:

a cylindrical member having ends each with an internal beveled surface, and an internal integral annular flange portion, said ends each being adapted to receive the conduits to be joined to abut said flange portion;

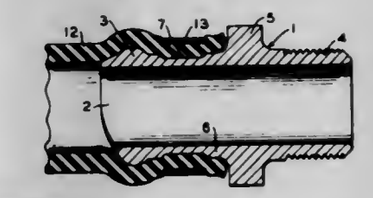
a pair of sleeve members, said sleeve members each being adapted for positioning on one of the conduits to be joined and having an internal annular inwardly extending edge at one end in engagement with one of said beveled surfaces, and an external outwardly protruding annular shoulder intermediate its ends;

internal and external cylindrically shaped envelope members, said envelope members each being adapted for positioning on the conduits to be joined to surround said cylindrical member and one of said sleeve members and each having a wrenching surface at one of its ends and an internal shoulder adapted to engage an external outwardly protruding shoulder of the sleeve member it surrounds, said internal and external envelope members having mutually cooperating external and internal threads, respectively, for drawing said envelope members together when said wrenching surfaces are wrenched to contract said sleeve members between said beveled surfaces and the conduits to force said edges into the conduits and provide fluid tight coupling of the conduits;



a flange on said internal envelope member and carrying said internal envelope wrenching surface;

and a jam nut in threaded engagement with the external threads of the internal envelope member for compressing the bulkhead between said flange and the jam nut,



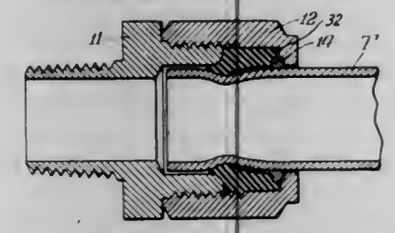
said jam nut extending around the internal shoulder of said internal envelope.

3,275,348
HIGH PRESSURE SEALED CONNECTIONS
William James Scott, Costa Mesa, Calif., assignor to VSI Corporation, a corporation of Illinois
Filed May 28, 1963, Ser. No. 283,733
1 Claim. (Cl. 285—212)

A high pressure sealed connection comprising, in combination, a bore formed in structure and having an internal thread spaced inwardly of the outer end thereof, a conical surface formed at the outer end of said bore, a spot face formed on the outer surface of said bore structure and intersecting the largest diameter end of said conical surface, a male fitting having an externally threaded end portion threadedly engaged in said bore, a conical surface complementary to said conical surface at the outer end of said bore formed on an enlarged diameter portion of said male fitting, a deformable metallic sealing member which is characterized by a conical portion which is seated between said complementary conical surfaces at the outer end of said bore and on said male fitting, by a cylindrical portion at the smallest diameter end of said conical portion which extends into said bore, and by an outwardly directed radial flange portion at the largest diameter end of said conical portion which is seated in said spot face, said conical portion of said sealing member being physically deformed between said complementary conical surfaces when said fitting is tightened in said bore whereby to provide a high pressure sealed joint at the outer end of said bore, and an outwardly directed wrench-engageable flange portion on said fitting which is spaced outwardly of said bore structure when said fitting is tightened in said bore whereby to permit a visual check of said seated sealing member.

3,275,349
HOSE CONNECTION DEVICE
Dale A. Chovan, Trafford, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed Dec. 12, 1963, Ser. No. 330,150
1 Claim. (Cl. 285—252)

In combination:



(a) an element having a cylindrical neck, a portion of which is of uniform diameter,

(b) a hose disposed in close frictional relation over said neck, said neck having adjacent the hose-receiving end thereof in circumferentially surrounding relation a rounded bead the periphery of which is of larger diameter than said uniform diameter, said uniform diameter portion having in the outer surface thereof in axially spaced relation to said bead an annular groove of substantial width in relation to length of the said uniform diameter portion, the bottom of said groove being of uniform diameter less than the diameter of said uniform diameter portion and the sides of the groove at the opposite extremities of the said bottom constituting oppositely facing shoulders joining the uniform diameter portion and the bottom of the groove, said shoulders being characterized by curved annular surfaces at the juncture with the uniform diameter portion, and

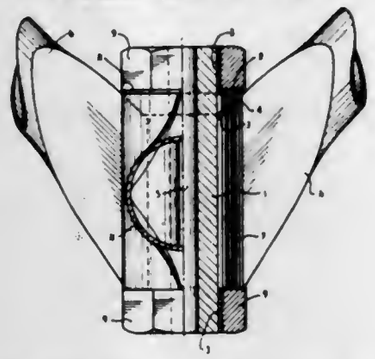
(c) an annular band of substantially the same width as that of said annular groove to clamp the hose to said neck portion, said band being axially positioned on said neck portion so as to coincide positionally with said annular groove and, when tightened in a clamping state, to compress the hose into said an-

nular groove to form an air-tight seal with the connection device resisting axial separation of the hose from the device.

3,275,350
FITTING
Joseph D. Kody, Arlington Heights, and Arthur M. Rabin, Des Plaines, Ill., assignors to Imperial-Eastman Corporation, a corporation of Illinois
Filed June 25, 1964, Ser. No. 377,883
2 Claims. (Cl. 285—341)

1. A fitting for resiliently connecting a tube, comprising:

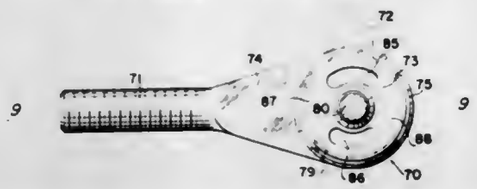
a body member having an outer end portion and a flow passage opening coaxially through said end portion;



a nut member having an inner end, a bore opening through said inner end, and an outer portion defining an axially inwardly facing, axially outwardly narrowing frusto-conical bore shoulder;

means for connecting said inner end of the nut member to said outer end of the body member;

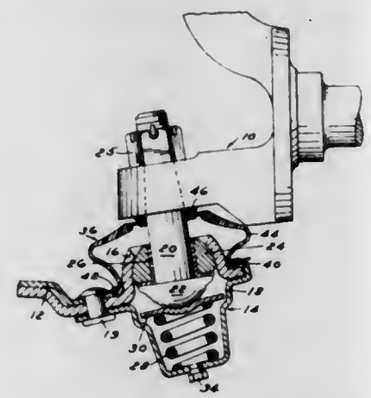
a resilient annular sleeve in said bore, said sleeve having an outer end abutting said shoulder, and an inner end abutting said body member end portion coaxially of said flow passage, said sleeve having a Shore A scale hardness of at least approximately 85; and



an annular gripper having an outer end defining a convex rounded axially outer bearing surface engaged by said frusto-conical shoulder of the nut member to urge the gripper axially inwardly as an incident of axially inward movement of the nut member relative to the body member, an axially inner radial shoulder engaging said outer end of the sleeve, and an inner portion comprising a thin tubular wall having a frusto-conical, axially inwardly narrowing, radially outer surface, an axially inner, constrictible tip portion defining an annular, radially inwardly extending projection having a radially inner cylindrical surface, an axially outer deflectable portion defining a radially inner cylindrical surface having a diameter larger than that of said cylindrical surface of the tip portion and a helical thread projecting radially inwardly from said cylindrical surface of said outer deflectable portion for biting into a tube extending coaxially in said nut member bore, said gripper, and said sleeve, said inner portion of the gripper being arranged in the made-up arrangement of the fitting to extend coaxially within and be transaxially resiliently supported by said outer end of the sleeve and said inner portion of the gripper being arranged to constrictively deform the inner portion of the sleeve and the tube and transaxially resiliently support the tube in said sleeve, said outer end of the sleeve being forced between said rounded outer bearing surface of the gripper and said frusto-conical shoulder of the nut member in the made-up arrangement of the fitting, said convex surface of the gripper engaging said frusto-conical shoulder of the nut member with annular line contact when the parts are first assembled and in substantially no load condition on said sleeve, said line contact moving progressively radially inwardly on the convex surface as full made-up condition is approached.

3,275,351
SEPARABLE JOINT
Arthur E. Fentiman, Stittsville, Ontario, Canada, assignor to Triodetic Structures Limited, Ottawa, Ontario, Canada
Filed Feb. 20, 1964, Ser. No. 346,291
1 Claim. (Cl. 287—54)

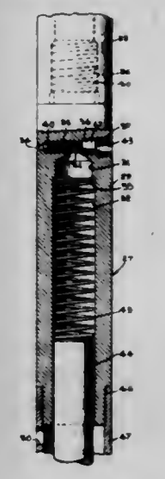
A separable joint comprising a unitary hub-like connector having a hub of a given diameter with circumferentially spaced longitudinally extending peripheral keyway slots, an integral coaxial externally threaded stud of a diameter less than said given diameter on each end thereof and an annular countersunk recess of conical cross-section in one end of said larger diameter portion concentric with the stud and at the junction thereof with said larger diameter portion, structural members with flat keyed ends engaging in said keyways, a washer having a taper complementary to the taper of said recess loosely nested in said recess and embracing the stud at said one end, and a pair of nuts one on each stud overlying opposite ends of said keyway slots and securing the ends of said structural members in said connector against accidental displacement, one face of each structural member having a slope which is the same as the taper of the recess, one nut directly engaging the tapered washer to force the latter into the recess and against the structural members and the other nut directly contacting the structural members, and the axial extent of said washer being greater than the depth of said recess, said washer being so constructed as to bottom on the axial inner wall of said recess, said double nut and washer combination providing adjustable clamping means including overstress prevention.



3,275,352
MECHANICAL LINKAGE JOINT
Vasalie L. Peickii, Hillsborough, Dan A. Christensen, Woodside, and John H. Bradfute, Santa Clara, Calif., assignors to Federal-Mogul Corporation, a corporation of Michigan
Original application Dec. 9, 1963, Ser. No. 330,518, now Patent No. 3,233,928, dated Feb. 8, 1966. Divided and this application Aug. 10, 1964, Ser. No. 401,746
12 Claims. (Cl. 287—85)

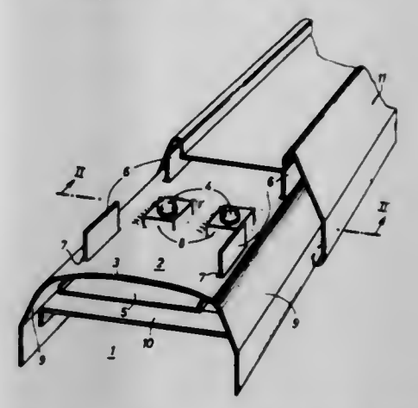
1. A steering joint comprising a pair of rod means lying in approximately parallel planes and at least one of which has a loop on one end, the loop having an axis, the other said rod means having an end portion extending into said loop along the axis of the loop and having means interlocking said end portion with said loop and preventing retraction from said loop, and an elastomeric connecting means within said loop and molded and bonded to both said loop and said end portion, said connection

including two substantially diametrically opposite loading portions spaced by apertures defining voids, the said rod having said loop extending along the diametric axis of said loading portions, whereby said rod means can rotate about said joint against relatively light force in the elastomer due to said voids, said rod means being restrained by said loading portions from translation of the two rod means relative to each other by considerably greater elastomeric force, whereby a longitudinal force along the axis of the said rod means having said loop, tends to produce tension in said elastomeric connecting means on one side of said end portion and compression in said connecting means on the other side of said end portion and translation of such steering joint, which in turn act to cause relative rotation of the other said rod means in a plane approximately parallel to that of the first named rod means with resultant rotation of said end portion relative to the axis of said loop, whereby torsion is set up in said elastomeric connecting means along the plane of said loop, the level of torsional force being a fraction of what would be present in a solid said elastomeric connecting means because of said voids.



3,275,353
BALL AND SOCKET JOINT SEAL
William B. Turck, Dearborn, Mich., and Robert W. Bertouille, Fairport, N.Y., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Jan. 27, 1964, Ser. No. 340,146
5 Claims. (Cl. 287—90)

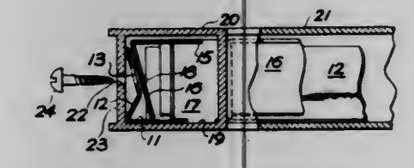
4. A ball and socket type joint having a spherical socket with a stud member protruding from said socket, a flexible seal surrounding said stud and having an opening therein in engagement with said socket, a sheet metal ferrule of annular shape secured to said stud, said ferrule having spaced apart flat radial flanges, said seal including a flexible rubber body portion with an opening concentrically fitted about said ferrule and between said flanges, one of said flanges having a flat surface facing said rubber body portion, said rubber body portion having at least one upstanding compressible concentric ridge slidably engaging said flat surface of said one radial flange, and an annular reinforcing ring embedded in said rubber body portion and spaced from said concentric ridge.



3,275,354
ROD COUPLER
Wayne N. Sutliff and Jim L. Downen, both of 2931 Pierce Road, Bakersfield, Calif.
Filed June 12, 1964, Ser. No. 374,683
3 Claims. (Cl. 287—103)

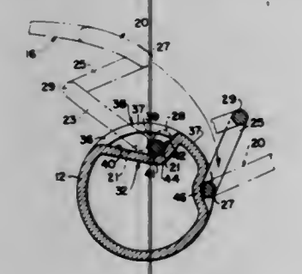
1. In a rod coupler, the combination of: a tubular coupling member; a pin coupling member; interlocking means on said members which slidably admits said pin member into said tubular member, when the two members are aligned, and prevents relative rotation between said members until said pin member has been inserted a predetermined distance into said tubular member, whereupon said relative rotation is permitted by said means and results in said means interlocking said members against separation axially; compressible torque producing means provided within said tubular member and engageable by said pin member during said relative axial movement between said members to compress said torque producing means, said means then functioning to produce relative rotation between said members thus causing said interlocking means to couple said members together, said torque producing means also resisting reverse relative rotation be-

tween said members after said members are thus interlocked, thereby retaining said members in coupled relation; liquid dashpot means including at least one port extending through the wall of said tubular coupling member and, the retarding action of which is applied to reinforce the resistance by said torque producing means to said reverse relative rotation between said members, said dashpot means drawing its operating liquid directly from that liquid in which said rod coupler is submerged; and means operatively disposed in said port to control the flow of said liquid therethrough.



3,275,355
COUPLING PIECE FOR UNITING CHANNEL-SHAPED PARTS
Herbert Endler, Hamburg-Gross Borstel, and Heinrich Duensing Hamburg-Rissen, Germany, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Sept. 26, 1963, Ser. No. 311,765
Claims priority, application Germany, Oct. 11, 1962, P 30,341
2 Claims. (Cl. 287—189.36)

1. A coupling for joining channel-shaped members having a reverse bend portion at each extreme tip thereof, said coupling comprising an elastically deformable support means of substantially the same shape and dimensions of said channel-shaped members adapted to nest loosely within said members, and supported in said reverse bend,



a thrust member connected with said support means, said thrust member having a plurality of projections extending beyond said support means for bearings on said channel tive to said support means for deforming said support members and means for moving said thrust member relameans into intimate frictional engagement with said channel members.

3,275,356
CORNER FASTENER FOR ALUMINUM EXTRUSIONS
James H. Heywood, 1411 Doncaster, Youngstown, Ohio
Filed Jan. 17, 1964, Ser. No. 338,455
8 Claims. (Cl. 287—189.36)

1. A corner construction comprising mitered hollow metal rails having opposed wall portions, a corner fastener for securing said mitered hollow metal rails to one another, said fastener comprising a pair of flat generally L-shaped body members each of which has longitudinally extending angularly disposed flanges on its outermost edges, the flanges on one of said L-shaped body members having apertures therein and the flanges on the other of said L-shaped body members having relatively small apertures therein positioned off center with respect to the center lines of said flanges, said L-shaped body members being arranged in oppositely disposed relation with said flanges in abutting relation and said apertures in adjacent offset relation to one another, and metal screws positioned through said metal rails and engaging one of the walls formed by said apertures in the flanges on one of said L-shaped body members and the walls of said apertures in said flanges on the other of said body members so as to move said flanges and said L-shaped body members relative to one another in the same plane and toward said respective wall portions of the rails whereby said flat L-shaped body members move apart and against said wall portions.

3,275,357
SEAT SPRING END CONNECTION TO FRAME
Paul C. Tabor, Clawson, Mich., assignor to Rockwell-Standard Corporation, Pittsburgh, Pa., a corporation of Delaware
Filed Sept. 20, 1965, Ser. No. 488,516
12 Claims. (Cl. 287—189.36)

1. In an end connection between a preformed wire seat spring strip member and a hollow tubular seat frame member, means forming a spring end retainer connection in a wall of the seat frame member and cooperating means disposed on the seat frame member in angularly displaced relation toward the interior of the seat frame providing a load bearing seat for said spring member on said frame member.

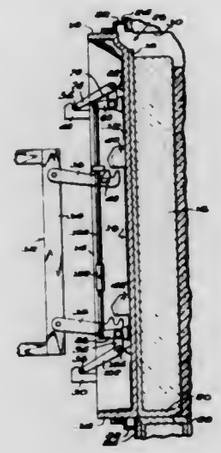
3,275,358
GLASS-TO-METAL AND GLASS-TO-CERAMIC SEALS
Francis J. Shonebarger, Lancaster, Ohio, assignor to General Electric Company, a corporation of New York
Filed Mar. 14, 1963, Ser. No. 265,235
9 Claims. (Cl. 287—189.365)

1. A glass for sealing to tantalum and to other metals, alloys, and ceramics having thermal expansion characteristics such that the mean coefficients of thermal expansion over the temperature range of 20° C. to 500° C. do not differ from that of tantalum over the same temperature range by more than about 10×10^{-7} cm./cm./° C., which has a composition, by weight, of about 40% B_2O_3, about 25% Al_2O_3 and about 35% BaO.

8. A hermetic seal body comprising a metal wall having an opening therethrough, a sapphire window in said opening and a glass body filling the space between and fusion sealed to said wall and said window, said glass body being composed of about 40% B_2O_3, about 25% Al_2O_3 and about 35% BaO by weight and having a mean coefficient of thermal expansion of about 60×10^{-7} cm./cm./° C. in the temperature range of about 0° C. to 300° C.

3,275,359
GLASS COMPOSITION FOR HERMETIC SEALS
William A. Graff, Willoughby, Ohio, assignor to General Electric Company, a corporation of New York
Filed Mar. 14, 1963, Ser. No. 265,265
7 Claims. (Cl. 287—189.365)

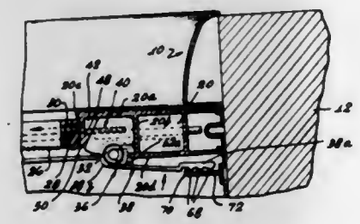
1. A glass for sealing to tantalum and to other metals, alloys, and ceramics having thermal expansion characteristics such that the mean coefficients of thermal expansion over the temperature range of 20° C. to 500° C. does not differ from that of tantalum over the same temperature range by more than about 10×10^{-7} cm./cm./° C., which has a composition by weight of about 25% Al_2O_3, about 35% BaO, from about 35% to slightly less than 40% B_2O_3 and from a small but effective amount to about 5% CeO_2.



7. A hermetic seal body comprising two sintered alumina ceramic tubes fusion sealed together by glass, said glass being composed of about 35% B_2O_3, about 25% Al_2O_3, about 35% BaO and about 5% CeO_2 by weight and having a mean coefficient of thermal expansion of about 61.7×10^{-7} cm./cm./° C. in the temperature range of 0° C. to 300° C.

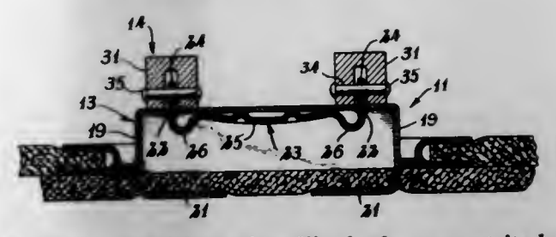
3,275,360
COKE OVEN DOOR LATCHING MECHANISM
Linwood G. Tucker, Pittsburgh, Pa., assignor to Koppers Company, Inc., a corporation of Delaware
Filed May 15, 1964, Ser. No. 367,756
8 Claims. (Cl. 292—7)

1. Apparatus for latching and unlatching a coke oven door having a body portion, a peripheral flange projecting outwardly therefrom, a seal means extending around the periphery of said flange for abutting a sealing surface surrounding the opening for said door and sealing said coke oven chamber, said latching and unlatching apparatus comprising,



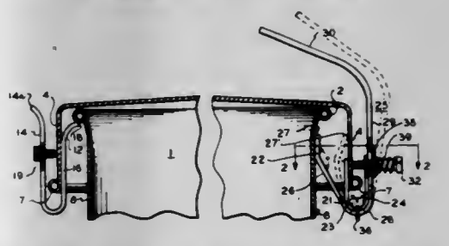
(a) a pair of upper retaining members affixed to and projecting from the coke oven structure and positioned on opposite sides of said door opening,
(b) a pair of lower retaining members affixed to and projecting from the coke oven structure and positioned on opposite sides of said door opening,
(c) upper lever means pivotally connected to said door and extending outwardly therefrom,
(d) lower lever means pivotally connected to said door and extending outwardly therefrom,
(e) door extractor receiver means secured to said door and extending outwardly therefrom,

(f) upper transverse engaging means secured to said upper lever means and arranged to be positioned in said upper retaining members to hold said door in sealing relation with said coke oven chamber,
(g) lower transverse engaging means secured to said lever and arranged to be positioned in said lower retaining means and operable to hold said door in sealing relation with said coke oven chamber,
(h) connecting means between said upper and lower lever means arranged to pivot both of said lever means so that upon engagement said transverse en-



gaging means exert substantially the same engaging force on said retaining members,
(i) door extractor means having door extractor arms, and
(j) actuator means associated with said connecting means, said actuator means arranged to be engaged by a portion of the door extractor arms upon upward movement of a portion of said arms into said door extractor receiver members to move said connecting means upwardly and disengage said upper and lower transverse engaging means from said respective retaining members to unlatch said coke oven door.

3,275,361
LOCKING HANDLE FOR SASH
Harry M. Riegelman, Rolling Hills, Calif., assignor to Ador Corporation, Fullerton, Calif., a corporation of California
Filed Feb. 7, 1964, Ser. No. 343,398
11 Claims. (Cl. 292—129)

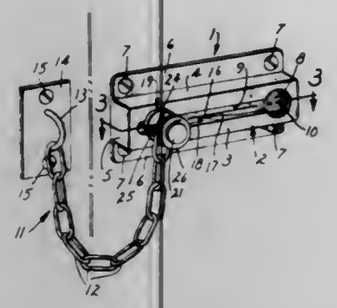


7. A combined handle and latch for a sliding sash, comprising:
a latch plate;
an integral sleeve at one end of said latch plate;
a combined handle grip and lock catch at the other end of said latch plate and integral therewith;
and a pair of oppositely wound coil springs in end-to-end abutment extending through said sleeve and pivotally securing said latch plate to said mounting block, the inner tail ends of said pair of coil springs being in abutment with said latch plate and applying a torque thereto.

3,275,362
CLASPS
Martin Jacobson, Providence, R.I., assignor to Rau Findings Company, Providence, R.I., a corporation of Rhode Island
Filed July 28, 1964, Ser. No. 385,616
9 Claims. (Cl. 292—204)

1. A clasp comprising a box-like body open at its bottom and having a front wall, said front wall having spaced apertures therein, a leaf spring seated against the inside face of said front wall, end portions on said spring disposed normal to the main body portion thereof and extending one through each aperture, a latch element arranged outside the front wall and hingedly connected to the said spring end portions, and means on said latch element to retain the latch element in a plurality of hinged positions under tension of said spring.

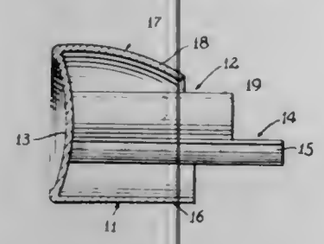
3,275,363
LID LATCH
Mortimer C. Bates and Charles H. King, both of Berkshire, N.Y. 13736
Filed Nov. 3, 1964, Ser. No. 408,537
9 Claims. (Cl. 292—228)



1. A latching device for releasably securing a lid having a circumferential depending flange to a container having an outwardly-extending rim, said device comprising, in combination: a U-shaped member fixedly attached to said flanges, said U-shaped member having two legs extending on opposite sides of said flange and a rounded portion passing around the edge of said flange and connecting said two legs of said member; a slidable member having an outer leg terminating in a handle portion, an inner leg having an end adapted to protrude beneath said rim, and a rounded portion intermediate said legs of said slidable member; fastening means for slidingly attaching said slidable member to said U-shaped member with said rounded portions of said two members slidably engaging each other; and spring means connected to bias said outer leg of said slidable member toward the outer leg of said U-shaped member, thereby urging said end of said inner leg of said slidable member beneath said rim to lock said lid on said container.

3,275,364
CHAIN-TYPE SAFETY DOOR LOCK
Bert A. Quinn, St. Paul, Minn., assignor to Ideal Brass Works, Incorporated, St. Paul, Minn., a corporation of Minnesota
Filed June 26, 1964, Ser. No. 378,309
3 Claims. (Cl. 292—264)

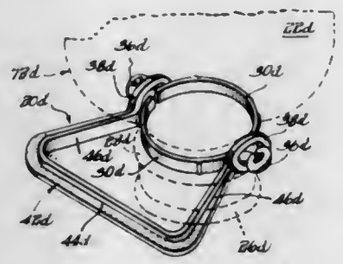
1. A chain-type safety door lock comprising:
(a) a locking plate member having an elongated slot and said slot being enlarged at one end portion thereof,



(b) said plate member defining a strike having a cam surface and an abutment surface, said strike being located generally adjacent said slot and being further arranged with the cam surface thereof sloping in a direction toward said enlarged slot end portion,

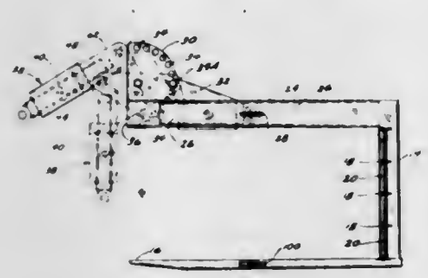
(c) a chain member having anchoring means at one end thereof and also having a coupler element at the other end thereof, and

(d) said coupler element being received in the enlarged end portion of said slot and slidable therealong and being outwardly biased whereby said coupled element rides over the cam surface of said strike and engages said abutment surface and is releasably retained thereby.



3,275,365
INTEGRAL HEAVY DUTY DOOR KNOB
William B. Wilson, Corona, Calif., assignor to Robert H. Miller and F. Louis Behrends, as joint tenants with right of survivorship, both of Peoria, Ill.
Original application Nov. 20, 1962, Ser. No. 238,973, now Patent No. 3,200,630, dated Aug. 17, 1965. Divided and this application July 14, 1965, Ser. No. 471,834
4 Claims. (Cl. 292—347)

1. An integral heavy duty door knob and internal tube assembly to provide an end wall and concentric tubular parts projecting rearwardly from the end wall, the outer tubular part being cylindrical adjacent the end wall and curving inwardly toward its inner end to provide a knob, and the inner tubular part providing an internal tube projecting rearwardly through and beyond the inner end of the knob, said inner tubular part having a longitudinal slot therein and provided at its inner end with an arcuate projection of the inner tubular part having spaced longitudinal edges providing a roll back for retracting a latch bolt.



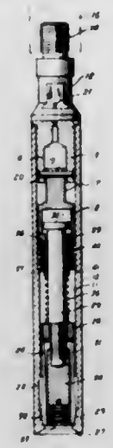
3,275,366
PLASTIC CARRIER FOR BOTTLES
Walter E. Hidding, 505 Banbury Road, Arlington Heights, Ill.
Filed Feb. 23, 1965, Ser. No. 440,659
16 Claims. (Cl. 294—31.2)

1. A carrier for containers and the like, said carrier comprising: a plurality of bands arranged in an endless series; a first cam follower on one of said bands; a second cam follower on an adjacent band; a coupling member having a cooperating complementary cam aperture receiving said first and second cam followers in rotatably slidable relationship therewith, said cam aperture having a first dimension which accommodates spacing apart of the cam followers whereby to enlarge the effective length of the endless series of bands for assembly of the carrier to a container, said cam aperture further having a second, smaller dimension which demands a closer spacing of said followers whereby to reduce the effective length of the endless series of bands for causing said bands to grip the container; handle means connected to said coupling member for use in carrying a container assembled with said carrier and for use in rotating said coupling member relative to said followers whereby to direct the spacing

thereof; and a formation interconnecting the ends of said followers away from said bands, including relatively thick sections, abutment elements outwardly of said relatively thick sections acting to confine said coupling member in position with respect to said followers, and a relatively thin medial section aligned with the space between said followers whereby to define a hinge for said relatively thick sections, converging of said relatively thick sections about said hinge facilitating passage of said abutment elements through said cam aperture for assembling said handle means to said bands.

3,275,367
LIFTING FORK FOR SHEET MATERIAL
Cecil W. Bopp, Waterloo, Iowa, assignor to The Greater Iowa Corporation, Des Moines, Iowa, a corporation of Iowa
Filed Mar. 25, 1964, Ser. No. 354,613
12 Claims. (Cl. 294—67)

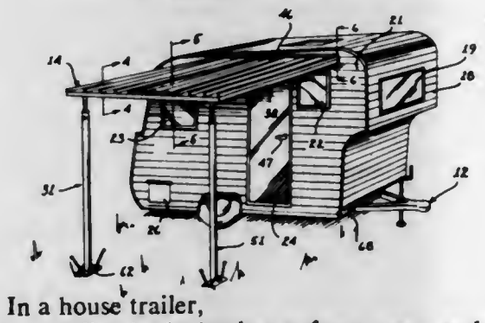
1. In a lifting fork apparatus,



a fork means including a normally horizontal frame portion,

a supporting assembly pivotally secured to said frame portion, said supporting assembly including a balance frame slidably mounted thereon,

connecting means on said balance frame for connection to an overhead lifting means,



and releasably interlocking means connecting said supporting assembly and said frame portion whereby said supporting assembly can be selectively disposed in one of a plurality of angular positions with respect to said frame portion, said balance frame being slidably movable towards and away from the pivotal connection between said supporting assembly and said frame portion whereby said fork means will be self-balancing under both loaded and unloaded conditions.

3,275,368
RELEASABLE RETRIEVING TOOL
Rowe A. Plunk, P.O. Box 1167, Midland, Tex.
Filed May 27, 1964, Ser. No. 370,429
19 Claims. (Cl. 294—86.3)

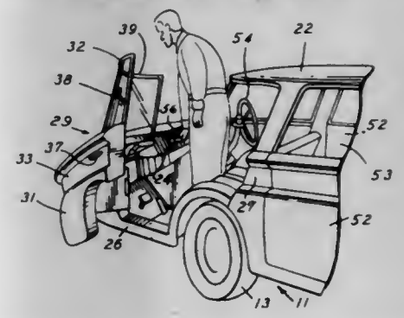
1. A retrieving tool including a tubular body having a reduced portion at the lower end of its bore, a slip assembly reciprocable in the bore for movement into and out of supporting engagement with its reduced portion and having gripping elements engageable with the reduced bore portion for inward movement into gripping position, a spring in said bore for urging the slip assembly downwardly into engagement with said reduced bore portion and permitting upward movement of said assembly and outward movement of the gripping elements upon relative downward movement of the body, means in said bore above said spring and coacting therewith to hold said slip assembly engaged with said reduced bore portion and movable relative to said assembly into a position to support said assembly out of engagement with said reduced bore portion, and restraining means confined in the upper portion of said bore and releasably connected to said body for preventing movement of said coacting means into its supporting position until the restraining means is released by movement relative to said body.

3,275,369
HOUSE TRAILER WITH RETRACTABLE PATIO ROOF
Lee E. Ecke, 7200 Paseo San Andres, Tucson, Ariz.
Filed Aug. 17, 1964, Ser. No. 389,862
7 Claims. (Cl. 296—23)

1. In a house trailer,

(a) a trailer body having a front, rear and two side walls, with a trailer top above and connected to said walls,

(b) a generally planular roof member secured by horizontal spring means to a side of said body approximately at the line of said trailer top, said trailer side having a door therein,

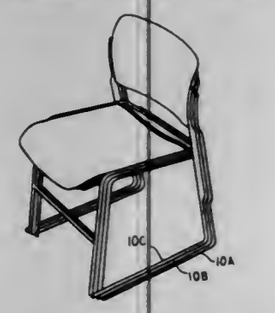


(c) means supporting said roof member to said trailer side for travelling,

(d) support means for an unhinged portion of said roof member to hold it in a generally horizontal position while attached to said trailer side,

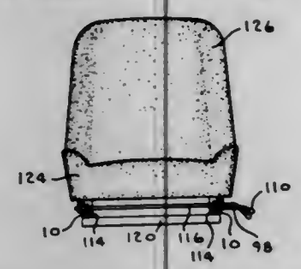
(e) means forming a door like opening in said roof member framing said trailer door when the roof member is in supported position against said trailer side to provide access to the trailer, and

(f) a door hinged on the roof member and adapted to close said door like opening.



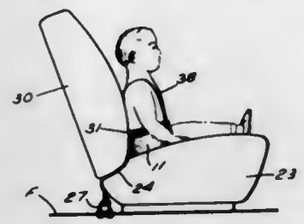
3,275,370
MOTOR VEHICLE
Raymond P. Smith, Huntington Woods, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed May 18, 1964, Ser. No. 368,296
3 Claims. (Cl. 296—63)

1. In a motor vehicle comprising a vehicle body mounted on a vehicle chassis having front and rear wheels defining a short wheel base, at least one row of front seats located proximate to said front wheels and two rows of rear seats, said two rows of rear seats having seat backs foldable from an upright position to a horizontal position, said seat backs when in a horizontal position providing a low deck loading area rearwardly of said one row of front seats, a first body opening located in its entirety above and forward of said front wheels for access to said one row of front seats, said first body opening defined at least in part by a generally vertically extending front door pillar, a generally vertically extending windshield post at the longitudinal center axis of said vehicle, and a generally transversely extending inner cowl member, a second body opening for access to the two rows of rear seats, said second body opening being on one side of said vehicle body and defined at least in part by a vertically extending rear door pillar and a vertically extending door jamb member, a first closure structure for said first body opening mounted on said vehicle body forward of said front wheels for movement between closed and opened positions, said first closure structure comprising a lower door structure with a front fender panel extending longitudinally thereof, a laterally extending hood portion and outer cowl forming extension affixed to the upper edge of said lower door structure and extending laterally inwardly thereof, and an upper glass panel including a generally longitudinally extending side window integrally formed with one-half of a generally transversely extending windshield extending upwardly from said outer cowl forming extension, a control arm for said first closure structure having one end pivotally connected to said front door pillar and having its other end pivotally connected to said lower door structure intermediate its vertical edges, follower means attached to the generally transversely inwardly extending end of said outer cowl forming extension, and an arcuate guide rail slidably receiving said follower means, said guide rail extending generally transversely outwardly and forwardly from said windshield post and supported by said inner cowl member, said control arm and said guide rail coacting to control the movement of said first closure structure from its closed position to an intermediate opened position laterally outwardly, forwardly and slightly tiltable forwardly with respect to said first body opening, said first closure structure then being angularly



displaced with respect to said body opening and further tilted forwardly during further opening movement of said first closure structure from said intermediate opened position to its maximum opened position, and a second closure structure pivotally mounted on said rear door pillar for swinging movement about a vertically extending axis coincident with one edge of said rear door pillar to provide access to said two rows of rear seats.

3,275,371
COMPACTLY STACKABLE CHAIR
David L. Rowland, 49 W. 55th St., New York 19, N.Y.
Continuation of application Ser. No. 237,057, Nov. 13, 1962. This application May 14, 1965, Ser. No. 456,609
5 Claims. (Cl. 297—239)

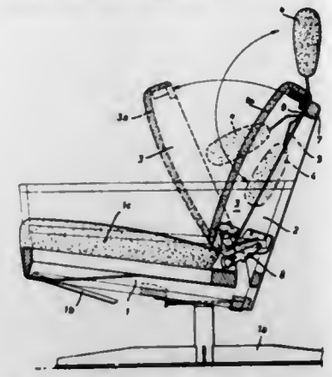


1. A lightweight, durable and compactly stackable chair comprising
- frame means providing substantially parallel front legs and substantially parallel side rails connected thereto,
- a pair of substantially parallel L-shaped side frame portions each comprising a bottom rail and a rear leg,
- interposed means connecting the front end of each said bottom rail to and spacing it from the bottom of the adjacent front leg,
- second interposed means connecting the rear legs to and spacing them from the side rails,
- seat and back means at least as thin as said frame means and L-shaped side frame portions and fastened to them,
- means for stiffening each said rear leg including an enlarged body portion in cross-sectional area, extending laterally of the body a substantial distance both above and below the spacing connection of said rear legs with said side rails, which is wider then the thickness of said rear leg.

3,275,372
SEAT STRUCTURE
Arthur O. Radke and William C. Oswald, Wauwatosa, and Joseph A. Champa, Milwaukee, Wis., assignors to Bostrom Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed Sept. 9, 1964, Ser. No. 395,200
8 Claims. (Cl. 297—285)

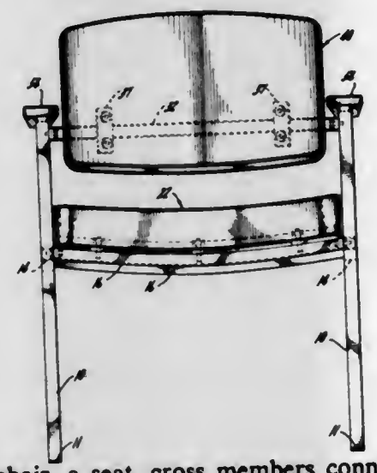
1. A seat cushion comprising, a base member, a seat pan mounted for relative movement in respect to said base member, resilient foam means fixed to said base and to the top of said seat pan to affect said relative movement as well as to provide static cushioning to an occupant of the seat, and spring means in parallel with said resilient foam means and cooperating therewith to vibrationally isolate said seat pan from the vibrations experienced by said base member.

3,275,373
INFANT-HOLDING ATTACHMENT FOR AUTOMOBILE SEATS
Londa Y. Card, 860 SW. 31st Ave., Miami, Fla.
Filed Oct. 15, 1964, Ser. No. 404,012
1 Claim. (Cl. 297—389)



In an infant-holding attachment adapted for use in a vehicle for safely holding an infant in the seat of the vehicle,
- a flat bottom member arranged for disposition on the seat,
- a flexible fabric band affixed to the periphery of the bottom member and extending upwardly therefrom for completely encircling a lower portion of the infant's torso,
- means forming a pair of spaced openings in a front portion of said band extending upwardly from said bottom member through which, respectively, the infant's legs may extend,
- said band being vertically split at a rear portion thereof and having cooperating fastening means at said split to provide for selectively opening the rear portion of said band,
- a waist strap extending around said band above said openings and affixed to said band around to said split to provide a pair of loose ends at said split, buckle means on said loose ends for interconnecting the loose ends across said split, a pair of elongated adjustable shoulder straps secured respectively at the ends thereof to front and rear portions of said waist strap and arranged to extend over the infant's shoulders,
- a pair of connecting straps extending transversely to said shoulder straps and connected at opposite ends thereof to said shoulder straps,
  - said connecting straps including means operative to provide adjustably slidable movement of said connecting straps along the length of said shoulder straps,
- an elongated tension strap having a loop formed at one end thereof encircling the buckled loose ends of said waist strap,
- a buckle on the loop of said tension strap for selectively adjusting the length of said tension strap, and
- means at an opposite end of said tension strap for connection to a fixed member of the vehicle.

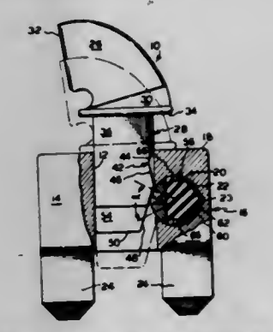
3,275,374
UPHOLSTERED FURNITURE COMPRISING A HEAD REST
Josef Holzner, Taufkirchen, and Alois Schefthaler, Post Taufkirchen, Germany, assignors to Himolla Polstermobelwerk Carl Hierl G.m.b.H., Taufkirchen, Germany
Filed Apr. 14, 1965, Ser. No. 448,204
Claims priority, application Germany, Dec. 21, 1964, H 54,661; Aug. 27, 1964, H 4,910
3 Claims. (Cl. 297—403)



1. In the art of manufacturing upholstered furniture such as armchairs, television seats, sofas, settees, couches and the like improvement that comprises the provision

of a head rest which in its inoperative position is received in a cavity in the back rest and which is connected with the posterior back rest section by means of a guiding mechanism, said mechanism having as its principal element a structure of co-acting pivoting arms, forming a selectively adjustable mechanical system wherein the said

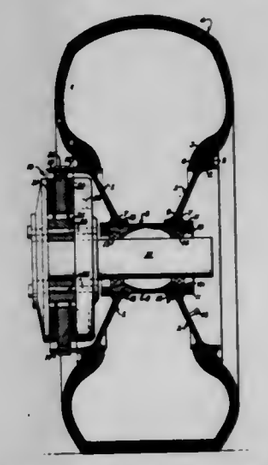
head rest is adapted for functional movement from the inoperative position to the operative position above the back rest after the anterior back rest section has been tilted frontwards, and wherein the posterior back rest section turns on a pivot-like shaft pin fitting provided on the seat unit enabling it to travel between at least two distinct locked angular positions.



3,275,375
CHAIR
Donald L. Moore and Orville E. Snyder, both of Gallatin, Tenn., assignors to Hamilton Cosco, Inc., Columbus, Ind., a corporation of Indiana
Filed May 17, 1965, Ser. No. 456,281
7 Claims. (Cl. 297—445)

1. In a chair, a seat, cross members connected to the underside of said seat and joined at their ends to a pair of side rails, rear leg members connected to said side rails and projecting above said seat, a transversely extending back frame connected to said rear leg members adjacent the upper ends thereof, a pair of laterally spaced plates mounted on said back frame, a back rest connected to the front faces of said plates, and means for supporting said seat in an elevated position above the ground.

3,275,376
RETAINER FOR COAL CUTTER BITS
Robert F. Prox, Jr., West Terre Haute, Ind., assignor to Frank Prox Company, Inc., Terre Haute, Ind., a corporation of Indiana
Filed Apr. 17, 1964, Ser. No. 360,720
7 Claims. (Cl. 299—92)



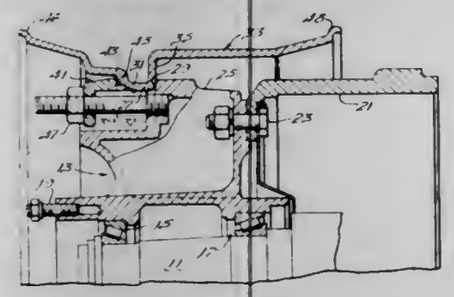
1. In combination; a socket member, first and second intersecting passageways each extending through said socket member, an interconnecting aperture formed by the intersecting of said passageways, a cutter bit, said cutter bit having a head section and a shank section, said shank section being slidably fitted through said first passageway in the socket member; detent means; said detent means being fixed against rotation in said second passageway to releasably secure said cutter bit shank in said first passageway; said detent means comprising an elongated estomeric cylinder, a cut-out section midway along said cylinder, non-yielding abutting means, said abutting means being fixed in said cut-out so as to form a contiguous surface with the elastomeric cylinder, said abutting means

being resiliently fixed adjacent the intersection of said first and second passageways when the detent means is fixed in the second passageway to releasably secure the cutter bit shank in the first passageway.

5. A resilient detent means consisting of; a elastomeric cylinder, an integral flange extending from the surface of said cylinder parallel to the axis thereof, a cut-out section midway along the length of the cylinder opposite said flange, a rigid abutment means, said abutment means being shaped identically to the cut-out in the cylinder, means fixing said abutment means in the cut-out in the cylinder so as to form a contiguous surface including the elastomeric material and the abutment means.

3,275,377
WHEEL FOR A TUBELESS TIRE
René Lucien, Neuilly-sur-Seine, France, assignor to Societe a Responsabilite Limitee: Recherches Etudes Production R.E.P., Paris, Seine, France
Filed July 29, 1964, Ser. No. 385,966
Claims priority, application France, July 30, 1963, 943,196, Patent 1,371,947
1 Claim. (Cl. 301—6)

A wheel for a tubeless tire mounted thereon comprising a hub, two half-wheels, and brake means, the two half-wheels being supported independently of each other and each comprising a portion in the form of a frusto-conical disc, the two frusto-conical discs being generally symmetrical with respect to the central plane of the tire and each comprising a large diameter circular base and a



small diameter circular base, said large base comprising a tire bead-retaining shoulder portion and a tire bead-supporting portion of substantially the same width as the tire bead mounted thereon, the large base of one of said two discs comprising a generally cylindrical extension carrying rotating parts of the brake means and housing said brake means, said hub including tapered male end portions, the small bases of each said disc including elongated tapered female portions each mounted on the tapered portions of the hub and held in assembled relation by an axial nut and comprising airtight packings.

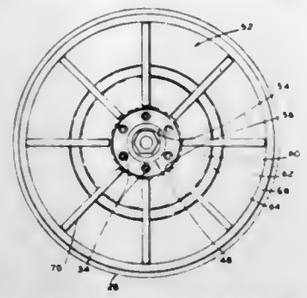
3,275,378

SPOKED VEHICLE WHEEL HAVING SELECTIVE SPACER MEANS FOR AXIALLY POSITIONING A TIRE RIM

Sylvester A. Malthaner, Rockford, Ill., assignor to Kelsey-Hayes Company, Romulus, Mich., a corporation of Delaware

Filed Aug. 3, 1964, Ser. No. 387,131
3 Claims. (Cl. 301—12)

1. An automotive wheel rim and spacer assembly for an automotive tire including a wheel supported upon an axle by a pair of axially spaced wheel bearings for rotation about a central axis, said wheel having a plurality of radially extending spokes, each of which is formed with an outwardly facing axially extending rim supporting surface and a shoulder extending substantially perpendicular to said rotational axis, an annular rim having an axially extending surface at an intermediate portion spaced inwardly of its edges and adapted to fit closely but slidably on said axial surfaces of said spokes and having a shoulder extending substantially perpendicular to said rotational axis positioned to face said shoulders on said spokes, a plurality of selected spacer means adapted to be positioned one between each said spoke shoulder and said shoulder on the rim, said spacer means each having a pair of shoulders extending substantially perpendicular to said rotational axis and adapted to seat against the shoulders on said rim and spokes, respectively, and provided with a dependent portion removably secured to a respective one of said spokes, clamping means having a portion adapted to seat on said spoke axial surfaces and provided with a tapered surface adapted to engage a tapered surface on said rim and bolt means securing said clamping means to each said spoke for clamping said rim on said wheel.



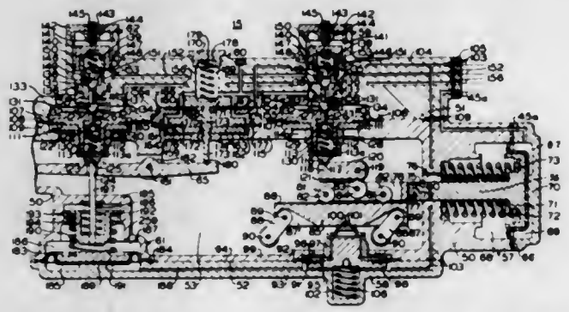
3,275,379

PROPULSION AID FOR MOTOR VEHICLES

Theodore N. Smith, 454 S. Massey St., Watertown, N.Y.

Filed Feb. 3, 1964, Ser. No. 342,313
1 Claim. (Cl. 301—41)

A propulsion and traction aid for the drive wheels of motor vehicles comprising an annular one piece disk having outer and inner annular planar portions joined by a conical offset portion, whereby the inner planar annular portion is offset axially inwardly of the outer annular portion, said outer annular portion having an inwardly extending conical rim flange, and said inner annular portion, having a central annular recess portion offset inwardly of the inner annular planar portion and adapted to nest in the annular demountable stud recess of a demountable wheel, said annular recess offset having an annular planar flange provided with a central axle aperture and a plurality of stud receiving apertures disposed on a circle around the central aperture, and said disk having radial paddlelike blocks disposed uniformly angularly around



the disk and each block having an edge having an offset corresponding to the offset of said disk, and being affixed to the inner and outer planar annular portions and conical offset portion, whereby the traction disk provides annular clearance for a wheel tire, and is rigidified by the conical offset and spaced paddles affixed to the disk.

3,275,380

COMBINED DYNAMIC AND FLUID PRESSURE BRAKE SYSTEM FOR RAILWAY VEHICLES

Harry C. May, East McKeesport, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed Oct. 23, 1965, Ser. No. 503,112
19 Claims. (Cl. 303—3)

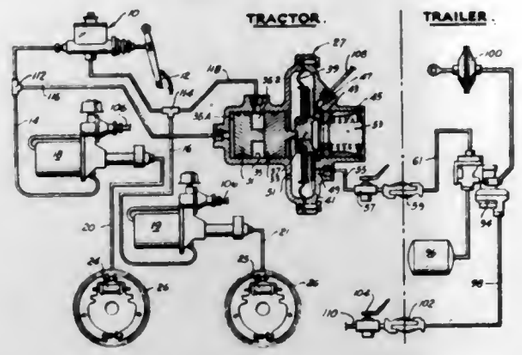
11. For use in a combined electro-dynamic and fluid pressure brake system for a vehicle, a valve mechanism comprising:

(a) a casing having therein a first chamber,

(b) a lever pivotally mounted on said casing,

(c) a fluid motor subject to the pressure established in said first chamber for exerting a first moment on said lever tending to rock it in one direction,

(d) electro-responsive means carried by said casing energized according to the degree of dynamic braking effect and effective according to the degree of energization thereof to exert a corresponding second moment on said lever tending to rock it in an opposite direction to thereby counterbalance said first moment when said first and second moments are of equal magnitude,



(e) self-lapping valve means operative by the rocking of said lever in said one direction out of a predetermined position in which it is positioned by said moments when of equal magnitude in response to a reduction in the magnitude of the moment exerted by said electro-responsive means to supply a control fluid pressure corresponding in degree to the unbalance of said moments, said self-lapping valve means including fluid pressure responsive means subject to the control fluid pressure established by said valve means to exert a counter moment on said lever for restoring it substantially to its predetermined balanced position.

3,275,381

FLUID PRESSURE SERVOMOTOR

Gunther Pfeifer, South Bend, Ind., assignor to The Bendix Corporation, South Bend, Ind., a corporation of Delaware

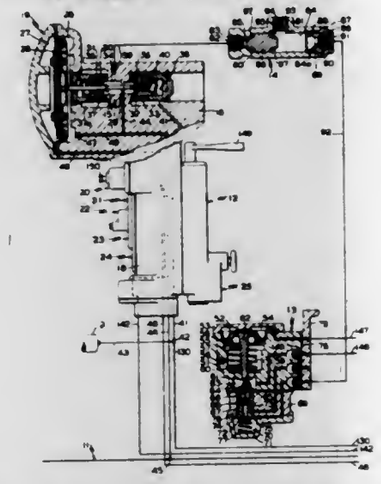
Filed June 29, 1964, Ser. No. 378,600
1 Claim. (Cl. 303—7)

In a tractor-trailer brake system including a split master cylinder, a pair of fluid pressure servomotors independently connected to said master cylinder such that one portion of said master cylinder operates one servomotor and another portion of said master cylinder operates another one of said servomotors, the improvement of a control valve for operating a relay valve of the trailer brake system which control valve comprises:

a valve seat;

a valve poppet means normally in spaced relation from said valve seat;

a first piston means for moving said valve seat to contact said valve poppet means; and



a second piston means operatively connected to said first piston means for moving said valve seat to contact said valve poppet means such that pressure on one or both of said first and second piston means will operate said control valve.

3,275,382

RAILWAY FLUID PRESSURE BRAKE SYSTEM WITH MEANS ASSURING MINIMUM BRAKE PIPE REDUCTION FOR BRAKE APPLICATION

Robert J. Worbois, Irwin, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed Oct. 26, 1964, Ser. No. 406,379
10 Claims. (Cl. 303—15)

1. In a fluid pressure brake system for a locomotive, the combination of:

(a) a train brake pipe normally charged to a certain pressure,

(b) an equalizing reservoir normally charged to said certain pressure,

(c) a manually operated brake valve device comprising:

(i) a fluid pressure operated relay valve means subject opposingly to the pressure in said equalizing reservoir and said train brake pipe for effecting the supply of fluid under pressure to and the release of fluid under pressure from said brake pipe in accordance with a corresponding increase and decrease in the pressure in said equalizing reservoir,

(d) a minimum reduction reservoir,

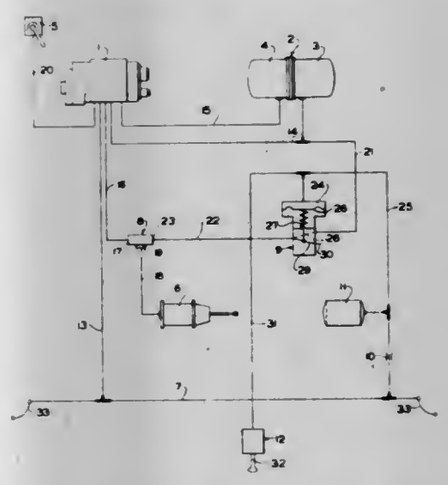
(e) an electro-responsive valve device operable in response to energization to establish a communication between said equalizing reservoir and said minimum reduction reservoir through which fluid under pressure flows from said equalizing reservoir and said fluid pressure operated relay valve device to said minimum reduction reservoir to cause said relay valve device to operate to release fluid under pressure from said brake pipe to cause a brake application,

(f) a double check valve device,

(g) a first conduit connecting one end of said double check valve device to said fluid pressure operated relay valve means, through which conduit flows fluid under pressure released from said brake pipe by operation of said relay valve means,

(h) a second conduit connecting the opposite end of said double check valve device to said minimum reduction reservoir, and

(i) a fluid pressure operated cut-off valve device disposed in said second conduit and operable to cut off flow of fluid under pressure therethrough upon the pressure in said minimum reduction reservoir reaching a chosen value,



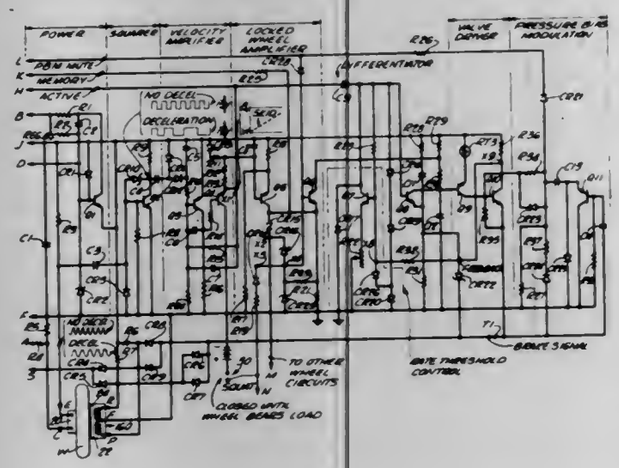
(j) said double check valve device being operable alternatively to release fluid under pressure from said first and second conduits accordingly as the pressure in one of said conduits predominates over that in the other until the pressure in said minimum reduction reservoir reaches said chosen value.

3,275,383

FLUID PRESSURE BRAKE SYSTEM

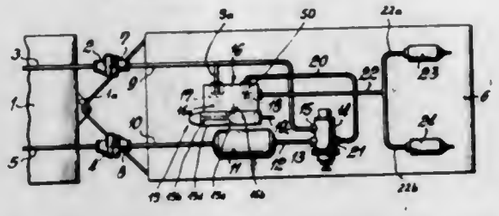
Clarence R. Baechtel, Pitcairn, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Filed June 19, 1964, Ser. No. 376,326
13 Claims. (Cl. 303—18)



1. A railway vehicle brake system comprising, in combination:

(a) a brake pipe normally charged with fluid at a chosen pressure,

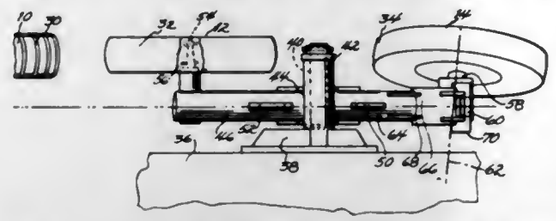


(b) a reservoir charged with fluid under pressure,
(c) a brake cylinder device effective when pressurized to effect a brake application and when depressurized to effect a release of the brake application,
(d) fluid pressure responsive control valve means operatively responsive to a reduction from the normal charged pressure in the brake pipe at a rate in excess of a certain rate to effect pressurization of the brake cylinder device from said reservoir and to restoration of the normally charged pressure in the brake pipe to effect depressurization of the brake cylinder device,
(e) fluid pressure responsive relay valve means having a control chamber chargeable with fluid under pressure from the brake pipe, said relay valve means being operative responsively to reduction of pressure in said chamber below a predetermined value to a fluid pressure supply position communicating fluid pressure from said reservoir to said brake cylinder device via said relay valve means to effect a brake application, and operative responsively to a charging pressure in said chamber exceeding said predetermined value to a cut-off position to effect release of fluid pressure from said brake cylinder device via an atmospheric vent in said relay valve means and thereby release of the brake application, and
(f) a valve device actuable for effecting reduction of the pressure in the control chamber of said relay valve means to below said predetermined value.

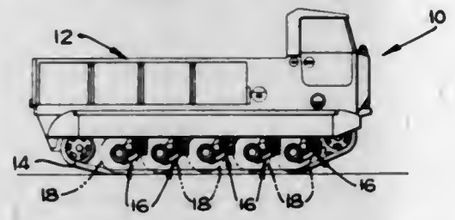
3,275,384
AUTOMATIC BRAKE CONTROL SYSTEM
Edgar A. Hirzel, Granada Hills, Calif., assignor to Crane Co., Chicago, Ill., a corporation of Illinois
Filed Jan. 10, 1966, Ser. No. 519,768
5 Claims. (Cl. 303—21)

1. A vehicle brake control system for a vehicle having a plurality of load-bearing wheels each having a respective brake means associated therewith and electromagnetically actuated brake control means effective when energized to relax brake application, said system comprising:
first means, including, in combination with a first one of the wheels, transducer means associated with said first wheel effective to produce an electric signal which varies with variations of the rate of deceleration of said first wheel;
second means, connected to said first means and including valve driving circuit means connected to said brake control means, effective in response to production by said first means of a signal representing an increase in the rate of deceleration of the said first wheel above a desirable maximum rate to provide electric energizing current to the electromagnetically actuated brake control means to actuate the latter to cause relaxation of brake application to said first wheel;
third means, connected to said second means, effective incident to provision of electric energizing current to said brake control means by said second means to cause a momentary effective rapid reduction in electric energizing current provided to said brake control means by said second means, whereby the time period required to effect desired resumption of brake application to said first wheel is reduced and compensation is provided for inherent inertia in the brake means.

3,275,385
BRAKE SYSTEMS FOR AUTOMOTIVE VEHICLES
Oskar Vielmo, Stuttgart-Sonnenberg, and Kurt Müller, Schnait, Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany
Filed Aug. 16, 1965, Ser. No. 480,201
Claims priority, application Germany, Aug. 14, 1964, B 78,103
4 Claims. (Cl. 303—30)



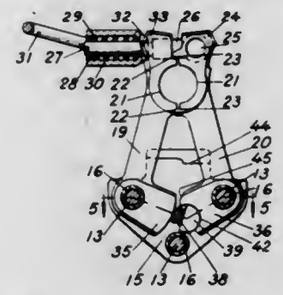
1. In a dual brake system for vehicles, particularly for trailers, a brake cylinder; a supply line and a service line each arranged to convey a compressed fluid; a control valve assembly including a housing having a first and a second inlet respectively connected with said service line and said supply line, an outlet, and first and second passages respectively connecting said outlet with said first and second inlets, said assembly further comprising a first valve for normally sealing said first inlet from said outlet, a second valve arranged to open in response to a predetermined minimum pressure at said second inlet to thus permit fluid to flow from said supply line to said outlet, and motion transmitting means for opening said first valve in response to closing of said second valve so that said outlet can receive fluid from said service line when the pressure in the supply line drops below said predetermined minimum pressure; a further line connecting said outlet with said cylinder; and a load responsive valve connected with said service line and including a normally closed supply valve provided in said further line, said load responsive valve also comprising means for opening said supply valve in response to admission of fluid into said service line and to the extent determined by the load upon the vehicle.



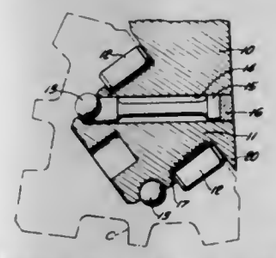
3,275,386
CRAWLER TRACTOR SUSPENSION
Eugen Bexten, Hamilton, Ontario, Canada, assignor to International Harvester Company, Chicago, Ill., a corporation of New Jersey
Filed Aug. 4, 1964, Ser. No. 387,352
9 Claims. (Cl. 305—10)

3. In the front suspension of a track laying vehicle:
support means operatively connected to the vehicle at a side and having an outwardly directed opening;
a spindle disposed in a horizontal position transversely to the direction of running, and having means of securement in the opening in the support means;
said means of securement comprising spaced-apart eccentrics carried by the spindle and socketed to turn in oppositely outwardly facing ball seats integral with the support means; and

a set of engageable means on the outer end of each eccentric providing for forcible relative rotation between the eccentrics;
the interface of contact between each ball seat and the eccentric socketed therein affording freedom of turning movement of the eccentrics angularly between those planes, and angularly in such planes, which are rotated both away from and into coincidence with the planes of the respective seats in which the eccentrics turn.

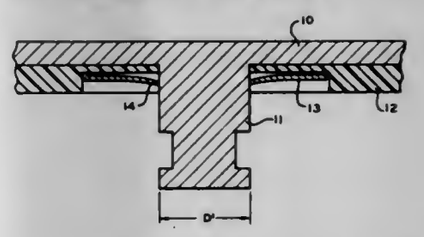


3,275,387
VEHICLE SUSPENSION SYSTEM
Albert R. Hedges, Cupertino, Calif., assignor to FMC Corporation, San Jose, Calif., a corporation of Delaware
Filed Aug. 13, 1964, Ser. No. 389,342
12 Claims. (Cl. 305—27)



1. A vehicle suspension system, comprising a wheel support arm pivoted at one end to the body of the vehicle, a wheel supported by the free end portion of said wheel support arm, a drum type torsion spring having two resiliently interconnected force transmitting elements, means mounting said spring in substantially coaxial relation to the wheel and anchoring one of said elements to the free end of said support arm, torque reaction means pivoted to the other of said force transmitting elements and to the body of the vehicle, and means for radially adjusting the latter pivot point relative to the pivot point of said wheel support arm.

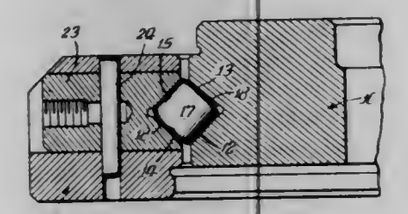
3,275,388
DRILL CENTRALIZERS
Birger Zettergren, Nacka, Sweden, assignor to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Mar. 18, 1963, Ser. No. 265,829
Claims priority, application Sweden, Mar. 29, 1962, 3,512
9 Claims. (Cl. 308—3.9)



1. In drill steel centralizer apparatus of the character described for guiding the drill steel of a rock drilling machine and having a base for attachment to said machine and a pair of opposed guiding arms having pivotal connections to said base and being movable toward and away from each other from a guiding position adjacent each other to a non-guiding position away from each other, and a guiding surface disposed on each of said arms for mutual cooperation to form a guiding opening in said guiding position of said arms, the combination which comprises a second pair of arms rigidly disposed on said guiding arms and extending radially from said pivotal connections therefor on the ends thereof opposite said guiding surfaces, said second arms extending toward each other in opposed relationship, axially compressible resilient means disposed under compression between said second arms, pivot means on one of said second arms for connecting one end of said resilient means pivotally to said arm, means on the other of said second arms for connecting the other end of said resilient means slideably to said arm for guided axial movement of said resilient means with respect to said arm while being angularly rigid relative thereto, and means in said resilient means providing substantial lateral rigidity thereof whereby said resilient means has a snap-over point in an intermediate position of swing of said guiding arms, so that movement of one of said guiding arms past said snap-over point causes said resilient means to move the other said guiding arm for snapping said guiding arms into said guiding position at one side of said snap-over point and into said non-guiding position at the other side thereof and for holding said guiding arms in said selected positions thereof.

3,275,389
CARBURIZED DRILL BIT BEARING
William J. Neilson, Whittier, and John F. Fischer, Garden Grove, Calif., assignors to Smith Industries International, Inc., Compton, Calif., a corporation of California
Filed Dec. 9, 1963, Ser. No. 329,137
2 Claims. (Cl. 308—8.2)

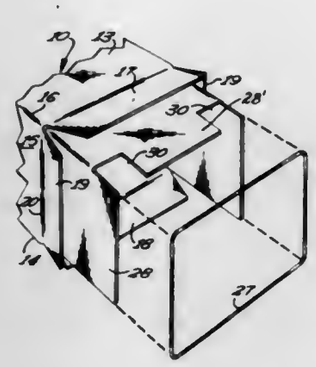
1. A journal for a well drilling bit having a roller race and a ball race separated by a flange wherein the lower portion of the roller race is deep carburized and the upper portion of the roller race, the entire ball race, and the flange are thinly carburized.



3,275,390
RETAINER RING AND WASHER FOR TRACTOR-TRAILER WITH FIFTH WHEEL
Bobby G. Franks, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Sept. 1, 1964, Ser. No. 393,584
3 Claims. (Cl. 308—136)

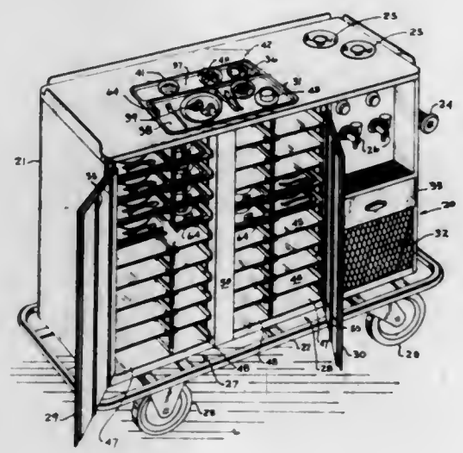
1. A retainer ring for holding a lubricating disc onto a kingpin used on a trailer fifth wheel assembly, said ring comprising an annular metal ring having an inner diameter smaller than that of said kingpin and at least two

radial slits extending from the inner circumference a portion of the radius from said inner circumference to outer circumference so that the inner circumference will be easily enlarged when said retaining ring is attached to said kingpin.



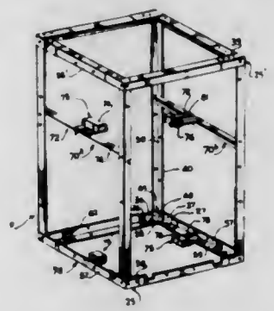
3,275,391
ROLLER BEARING
Robert L. Blais, Muskegon, Mich., assignor to The Kaydon Engineering Corporation, Muskegon, Mich., a corporation of Michigan
Filed Feb. 20, 1964, Ser. No. 346,254
5 Claims. (Cl. 308—174)

1. In a roller bearing, inner and outer races each of unitary construction and having a concentric groove of approximately V-shape in cross section providing two bearing surfaces substantially perpendicular to each other and flat axially of said race, said grooves defining a race way substantially square in cross section providing two pairs of flat inclined bearing surfaces with those of one pair inclined oppositely to those of the other pair, a plurality of cylindrical rollers of uniform diameter in said race way having substantially full length bearing contact with said bearing surfaces, the length of the respective rollers being less than the diameter thereof in extent such that the length of the respective rollers when the bearing is under load is less than the distance between the bearing surfaces of said race way adjacent and opposed to the ends of said rollers, and individual spacers mounted in said race way between said rollers and spacing them apart, each of said spacers having an arcuate recess in the sides thereof adjacent said spaced rollers, each arcuate recess having a radius greater than that of its adjacent roller whereby substantially line contact is effected between said spacers and said rollers.



3,275,392
STORAGE FILE BOX
Benjamin Fiterman, Minneapolis, Minn., assignor to Fidelity File Box, Inc., Minneapolis, Minn., a corporation of Minnesota
Filed Jan. 16, 1964, Ser. No. 338,189
2 Claims. (Cl. 312—108)

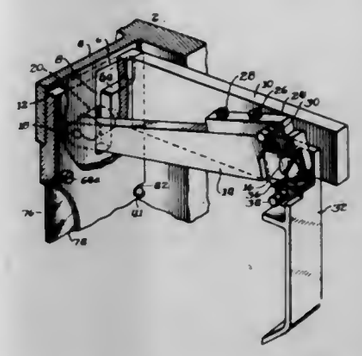
1. A storage file box comprising in combination, a shell section and a drawer section, said shell section being collapsible and having a bottom panel, a top panel and a pair of side panels, said panels being defined by scored lines along which said panels are folded into assembled relation to form a main body portion of the shell section, top, bottom and side foldable rear end panels defined by scored lines, said rear end panels folded into over-lapping relation closing the rear end portion of said shell section, top, bottom and side front end panels defined by scored lines folded inwardly upon said main body panels in overlapping and spaced relation thereto, a liner having a top panel and side panels depending therefrom disposed within the interior of the body portion of the shell section in close working fit, said liner having open end portions and an open bottom portion, a metallic reinforcing ring dimensioned to be detachably mounted in the front end portion of the shell section substantially at the scored line of the foldable front end panels, said metallic ring sandwiched between the front end panels of the shell section and the main body panels and positioned at the scored line of the foldable front panels by the substantially abutting forward edge of the liner which is also sandwiched between the front end panels of the shell section and the main body panels of the shell section, and means whereby a plurality of assembled storage file boxes



are secured one to other in stacked relation by a pair of laterally spaced nut and bolt assemblies extending through the bottom of the one shell section and the top body panel of an underlying shell section spaced rearwardly of the metallic reinforcing ring, the nut and bolt assemblies underlying the bottom front end panel of the upper stacked shell section and underlying the top front end panel of the lower stacked container.

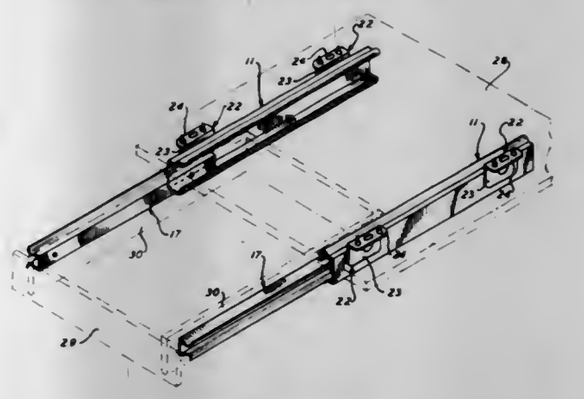
3,275,393
HOT AND COLD FOOD SERVICE CART
Blair E. Stentz and William R. Conklin, Murfreesboro, Tenn., assignors, by mesne assignments, to United Service Equipment Co., Inc., Palmer, Mass., a corporation of Delaware
Filed Oct. 13, 1959, Ser. No. 846,159
16 Claims. (Cl. 312—214)

16. In a food service cart for transporting a plurality of individual meal trays in at least one compartment, each tray being separated into hot and cold food sections by a rib; the improvement comprising thermal barrier means aligned with the tray separating ribs for dividing the compartment into thermally different zones, said thermal barrier means comprising a downwardly extending web having a lower edge adapted to engage the upper surface of the tray separating rib of a lower tray when said lower tray is in place, and an upwardly extending web adapted to engage the lower surface of the tray separating rib of an upper tray when said upper tray is in place, the lower edge of the downwardly extending web of each barrier means and the upwardly extending web of the next lower barrier means being adapted to engage each other when no tray is positioned therebetween.



3,275,394
FURNITURE FRAME CONSTRUCTION
Heinz Massinger, 34—19 30th St., Astoria, N.Y.
Filed Aug. 3, 1964, Ser. No. 386,974
13 Claims. (Cl. 312—257)

1. In a cabinet, a rectangular frame structure, said frame structure comprising four vertical corner posts, a pair of corner assemblies at lower and upper ends of each post, horizontal cross members connecting each corner assembly with two other corner assemblies at adjacent corners of the frame structure, each of said corner assemblies including a pair of short angle bars having vertical walls abutted together at their ends in mutually perpendicular planes and having horizontal walls abutted together at their ends in mutually perpendicular coplanar disposition, and a right angle bridge plate engaged on the abutted horizontal walls to reinforce the corner assembly, each post and cross member being an angle bar with mutually perpendicular walls, the ends of the walls of the posts and of the cross members being formed with offset flanges engageable inside the short angle bars of the corner assemblies so that intermediate wall portions of the posts and cross members are flush with outer sides of the vertical and horizontal walls of the short angle bars for mounting wall panels thereon.

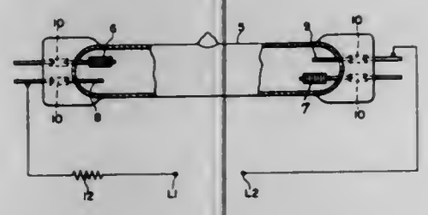


3,275,395
LOCKING MECHANISM
James F. Petelle, Chicago, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Jan. 12, 1965, Ser. No. 424,962
14 Claims. (Cl. 312—320)

1. In a motion picture printer of the type in which lenses are contained in a drawer slidable within a mounting means, the combination comprising:
- a first plate comprising a portion of said drawer;
- a second plate comprising a portion of said mounting means and having a mating surface adjacent said first plate when said drawer is slid into said mounting means, the other surface of said second plate being a locking surface;
- a locking slot in said first plate;
- a locking arm having one end thereof pivotally mounted on a side of said drawer and the other end extending through said locking slot in said first plate;
- means for pivoting said locking arm about said pivot;
- a locking element mounted on said other end of said locking arm;
- a slot in said second plate for receiving said locking element so that said locking element passes therethrough when the drawer is slid into the mounting means the locking arm being of a length so that the locking element is adjacent said locking surface when the drawer is substantially inserted into the mounting means, said second plate being adapted

to accommodate the motion of said locking arm as it is pivoted about said pivot, whereby said locking element wedges said second plate against said first plate, said drawer thereby being locked to said mounting means; and
- means for holding said locking arm and locking element in said locked position.

3,275,396
UNIVERSAL DRAWER SLIDE
Frank Hillson, 48 Brentwood Drive, Verona, N.J., and Rubin Krivisky, 4 Sherman Drive, Spring Valley, N.Y.
Filed Aug. 4, 1964, Ser. No. 387,376
3 Claims. (Cl. 312—341)



1. A universal drawer slide comprising:
(a) a channeled track and complementary rail, the track having a pair of longitudinal edges,
(b) at least one mounting member engaged to the track,
(c) a back member on the mounting member pivotally engaged to the track,
(d) a flange on the back member, and
(e) the plane of the flange extending above one of the edges of the channelled track when the said plane of the flange is parallel to the longitudinal axis of the track.

3,275,397
METHOD FOR PROCESSING DISCHARGE LAMPS
Walter V. Cushing, Verona, N.J., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 22, 1963, Ser. No. 303,771
5 Claims. (Cl. 316—25)

1. The method of initially reducing the starting voltage of a high pressure mercury vapor additive lamp to a de-

sired substantially constant value, which lamp has a radiation transmitting envelope and main operating electrodes and starting electrodes disposed within and proximate to each end of the envelope, which method comprises,

(a) initially seasoning said lamp by establishing an arc discharge between the main arc supporting electrodes of said lamp and maintaining the established discharge for a predetermined period of time,

(b) and thereafter discontinuing the discharge between the main electrodes and maintaining a discharge for a predetermined short period of time between the starting electrodes disposed at each end of said lamp to cause the starting electrodes to getter gaseous impurities within the lamp.

3,275,398

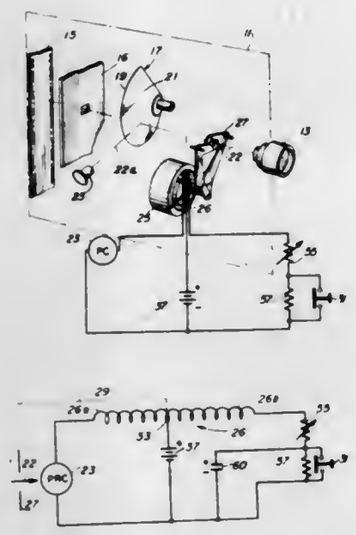
APPARATUS FOR HEAT TREATING LAMP FILAMENTS

Julien J. Mason, West Caldwell, N.J., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Original application Apr. 28, 1960, Ser. No. 25,285. Divided and this application Dec. 4. 1962, Ser. No. 253,012

3 Claims. (Cl. 316—27)

1. Apparatus for heat treating the filament of an unflashed incandescent lamp having a predetermined rated voltage and resistance, which apparatus comprises; (1) a preheating circuit including a voltage source that exceeds the rated voltage of said unflashed lamp by a predetermined amount, conductor means for connecting said lamp to said voltage source, current-limiting means, and a first switch arranged to connect said current-limiting means in series with the filament of said unflashed lamp and one side of said voltage source; and (2) a second circuit including a ballast lamp, second conductor means, and a second switch for connecting said second circuit in parallel relationship with the current-limiting means in said preheating circuit; the impedance of said current-limiting means being such that the current flowing through said unflashed lamp, when said first switch is closed, is sufficient to heat the filament thereof to a predetermined temperature below its recrystallization and sag temperature and thus increase the resistance of said filament; said preheating circuit and said second circuit when connected comprising a flashing circuit the total impedance whereof is greater than that of said unflashed lamp.



3,275,399

MOTION PICTURE CAMERA

William A. Johnson, Hoffman Estates, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois

Filed Feb. 28, 1964, Ser. No. 348,083

1 Claim. (Cl. 352—141)

In a motion picture camera, in combination,

an optical objective passing light rays along a light path,

a shutter including a sector movable into and out of said light path,

a reflecting surface on said sector,

said shutter being selectively operable and adapted to be stopped with said sector in said light path,

a light sensitive element,

said element being positioned to receive light rays from said reflective surface when said sector is moved into said light path,

a normally balanced two loop exposure control circuit means,

a compensating means for said circuit means comprising a resistance means and a control means,

said compensating means being selectively insertable, by means of a switch actuated with actuation of the shutter, into one loop of said circuit when said shutter is operating,

said resistance means serving to reduce the amount of current flow in said one loop to balance with that through said light sensitive element of the other loop,

whereby the current through said element when said shutter is stopped and said element is receiving constant illumination from said reflecting surface will be reduced to an amount equal to the current through said element when the shutter is operating and said element is receiving intermittent illumination from said reflecting surface,

said control means including a capacitor for causing the exposure control circuit to return to normal after a predetermined period of time following effective insertion of the resistance means and the beginning of operation of the shutter when said element is receiving intermittent illumination from said reflecting surface of the shutter,

whereby to cause the amount of current flowing in said exposure control circuit to remain substantially constant during the period required for bringing the shutter to full speed following a period in which it is stopped.

CHEMICAL

3,275,400

DYEING POLYOLEFIN MATERIALS

Eckhard Bonitz and Manfred Daeuble, Frankenthal, Pfalz, Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Filed Nov. 27, 1963, Ser. No. 326,362

Claims priority, application Germany, Nov. 30, 1962, B 69,815

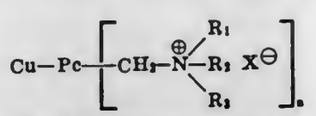
7 Claims. (Cl. 8—4)

1. A process for dyeing a polyolefin shaped article with a water-insoluble dye which is soluble in organic solvents, which process comprises: applying simultaneously to said article from a liquid medium (a) the dye and (b) a linear organosilicon polymer consisting essentially of the recurring units of the formula

in which R_1 represents alkyl and R_2 represents a member selected from the group consisting of hydrogen, alkyl, hydroxyalkyl and hydroxyalkyl esterified with sulfuric acid.

3,275,401

PROCESS FOR PREPARING FAST DYEINGS OR PRINTS ON CELLULOSE MATERIALS



Otto Fuchs, Frankfurt am Main, Reinhold Deubel, Kelkheim, Taunus, Alfred Brechlin, Frankfurt am Main, Hans Bühner, Kelkheim, Taunus, Erich Feess, Frankfurt am Main, and Hans Zimmermann, Hofheim, Taunus, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed July 9, 1963, Ser. No. 293,869

Claims priority, application Germany, July 14, 1962, F 37,312

4 Claims. (Cl. 8—54.2)

1. Process for preparing fast dyeings and prints on cellulose materials, which comprises applying on cellulose material a water-soluble phthalocyanine dyestuff of the formula

wherein R_1, R_2 and R_3 represent members of the group consisting of lower alkyl groups and hydroxy lower-alkyl groups, X stands for a member of the group consisting of chlorine and bromine, Pc stands for phthalocyanine and *n* has a value of 2 to 4 and fixing the dyestuff on the fiber with a reducing agent in the presence of an agent having an alkaline reaction at raised temperature.

3,275,402

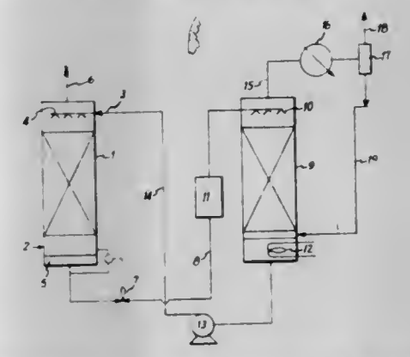
FORMALDEHYDE MODIFICATION OF CELLULOSE CONDUCTED IN THE PRESENCE OF A STIFFENING AGENT AND A LEWIS ACID METALLIC SALT

George C. Daul and Thomas F. Drake, Mobile, and Marshall W. Duke, Daphne, Ala., assignors, by mesne assignments, to Courtaulds, Limited, London, England, a British company

No Drawing. Filed June 2, 1961, Ser. No. 114,313

15 Claims. (Cl. 8—115.6)

1. A method for improving the wet and dry crease recovery properties of cellulose fabrics which comprises impregnating said fabrics with formaldehyde, with at least 0.03 mol, per 100 g. of cellulose, of a metallic salt which is a Lewis acid in the solid state and which is water soluble to the extent of at least 0.03 mol/liter at 20° C. and pH 5, and a polymeric film forming stiffening material capable of reacting with mormaldehyde, said impregnation with formaldehyde and metallic salt being effected in the presence of water at a pH of at least 5, and curing the impregnated material to cross link the cellulose and to bond the film forming material to the cellulose.



3,275,403

REMOVAL OF CARBON DIOXIDE AND HYDROGEN SULFIDE FROM GASEOUS MIXTURES

Bertrand J. Mayland, Jeffersontown, Ky., assignor to Girdler Corporation, Louisville, Ky., a corporation of Ohio

Filed Aug. 22, 1962, Ser. No. 218,645

7 Claims. (Cl. 23—3)

1. In a regenerative process for removing contaminants, including carbon dioxide as the principal contaminant and hydrogen sulfide as a substantial contaminant, from gaseous mixtures, wherein the contaminated gaseous mixtures are brought into intimate contact with a solution of potassium carbonate, said solution containing iron ions resulting in the production of a difficultly filtrable iron sulfide precipitate, the step of maintaining in the said solution from about .5% to about 2% of an amine chosen from the class consisting of monethanolamine, diethanolamine, triethanolamine and mixtures thereof, to cause said iron sulfide to precipitate at an increased rate and with a larger particle size, thereby making said precipitate readily filtrable, and filtering said precipitate from said solution.

3,275,404

PROCESS FOR SEPARATING RARE EARTH METAL VALUES

Ferdinand H. Firsching, Alton, Ill., assignor to Research Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Oct. 7, 1963, Ser. No. 314,506

5 Claims. (Cl. 23—22)

1. The method of separating a rare earth metal value from a solution containing additional rare earth metal values which comprises:

(a) adding to said solution at least two polyaminopolyacetic acid rare earth metal sequestering agents,

(b) thereafter adding an anion forming a relatively insoluble salt with the rare earth metal having the least chelate stability,

(c) further decreasing the solubility of the relatively insoluble salt by then adding a cationic replacing agent to the solution, and

(d) separating the thus formed precipate of the relatively insoluble salt.

5. The method of separating lanthanum and praseodymium which comprises adding to a solution containing lanthanum and praseodymium complexes with at least two polyaminopolyacetic acid sequestering agents, cadmium cation and iodate anion, and separating the thus formed precipitate of lanthanum iodate.

3,275,405

PROCESS FOR THE TREATMENT OF SOLIDS AT HIGH TEMPERATURES

Ezekail L. Clark, Pittsburgh, Pa., assignor to The North American Coal Corporation, Cleveland, Ohio, a corporation of Ohio

Filed Oct. 16, 1962, Ser. No. 230,838
9 Claims. (Cl. 23—142)

1. A process for carrying out endothermic chemical decomposition reactions with a particulate, solid reactant which decomposes into solid and gaseous reaction products upon application of substantial quantities of heat in a controlled atmosphere which comprises:

suspending said particulate solid reactant in an upwardly moving gas stream within a closed reaction vessel,

said gas stream providing the controlled atmosphere and comprising gases which are reaction products of the solid reactant,

heating a mass of discrete inert heat transfer particles in a zone which is isolated from the controlled atmosphere,

supplying heat to the solid particulate reactant and the upwardly-moving gas stream by countercurrently passing the heated inert particles with respect to the gas stream and the solid particulate reactants trained therein,

the velocity of said gas stream being insufficient to fluidize the downwardly flowing inert heat transfer particles but sufficient to transport the solid reactant upwardly through the reaction vessel, recovering the reaction products in the gas stream in the upper zone of the reaction vessel, and separating the gaseous reaction products from the solid reaction products.

7. Process as claimed in claim 1, wherein said solid reactant is a metal sulfate, said gas is sulfur dioxide and said decomposition products are the corresponding metal oxide, sulfur trioxide, and sulfur dioxide.

8. Process as claimed in claim 7, wherein said metal sulfate is aluminum sulfate, said oxide is aluminum oxide and the reaction temperature is at least 1470° F.

3,275,406

CONVERSION OF SO_2 TO SO_3 WITH A CATALYST OF SELECTED POROSITY

Robert Krempff, Paris, France, assignor to Compagnie de Saint-Gobain, Neuilly-sur-Seine, Seine, France

No Drawing. Original application Aug. 16, 1962, Ser. No. 217,288, now Patent No. 3,216,953, dated Nov. 9, 1965. Divided and this application Nov. 5, 1964, Ser. No. 409,298
6 Claims. (Cl. 23—175)

5. A method of oxidizing SO_2 gas to SO_3 on a vanadium oxide, potassium oxide, silica catalyst which comprises commencing the reaction on said catalyst having a predominant amount of pores having radii between 3000 to 5000 A. at a temperature above 440° C., continuing the reaction on a similar catalyst having a predominant amount of pores having radii between 1000 to 3000 A., at a temperature between about 400 and 440° C., and substantially completing the reaction on a similar catalyst having a predominant amount of pores having radii between 50 and 500 A. at a temperature below 400° C.

3,275,407

METHOD OF RECOVERY OF AMMONIA AND SULFUR DIOXIDE
